This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

+ *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.

+ *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.

+ *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.

+ *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at `http://books.google.com/`

ROYAL COMMISSION ON MINES.

PREFACE.

This volume contains the evidence submitted to the Royal Commission on Mines by representatives of the workmen in mines under the Coal Mines Regulation Acts. The evidence of a few other witnesses not representing the workmen is also included. The previous volumes issued by the Commission are :—

Minutes of Evidence, Volume I. [Cd. 3549], containing the evidence submitted by the Home Office and the Inspectors of Mines.

Minutes of Evidence, Volume II. (Cd. 3873], containing the evidence submitted by representatives of the coal owners, by mining engineers and others on the means of dealing with the dangers from explosions of coal dust, &c.

First Report [Cd. 3548], containing the interim recommendations of the Commission on the use of breathing appliances in rescue work after an explosion.

Codes of Rules in force in Mines and Quarries in the United Kingdom.

31, Great George Street,

Westminster, S.W.,

1*st October*, 1908.

MINUTES OF EVIDENCE

TAKEN BEFORE THE

ROYAL COMMISSION ON MINES.

THIRTIETH DAY.

Wednesday, 29th May, 1907.

PRESENT:

Lord MONKSWELL (*Chairman*).

H. H. S. CUNYNGHAME, Esq., C.B.
WM. ABRAHAM, Esq., M.P. (Rhondda).
F. L. DAVIS, Esq.
ENOCH EDWARDS, Esq., M.P.
THOMAS RATCLIFFE ELLIS, Esq.
JOHN SCOTT HALDANE, Esq., F.R.S.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. THOMAS RICHARDS, M.P., called and examined.

Mr. T. Richards, M.P.

29 May, 1907.

STATEMENT OF WITNESS.

19621. (1) *Government Inspection.*—The number of Government Inspectors is totally inadequate to secure anything approaching an efficient systematic inspection of the collieries, and I would suggest the creation of another class of assistant inspectors, one to every 10,000 workmen employed in the district, only persons having practical knowledge and experience of working in the mines to be eligible, and preference to be given those who hold certificates of competency under the present Act.

(2) *Inspection by Workmen under General Rule* 38.—If the foregoing was in operation I should not seek to alter Rule 38; otherwise Rule 38 should be amended so as to permit the appointment by the workmen of persons as examiners "who are," or have been, "practical underground workmen." From some cause or other the workmen do not use the power given them in Rule 38 as extensively as I think they should do.

(3) *Inspection under General Rule* 4.—The method of appointment of the officials under this rule is very unsatisfactory, as the owner, agent, or manager may appoint persons who have none of the special qualifications necessary for the efficient discharge of the important duties of firemen. One of the most important officials having to do with the safety of the colliery can be appointed without any test as to his fitness for the position. I would strongly urge a qualifying examination and certificate of competency.

(4) The firemen in South Wales and Monmouthshire have such a variety of duties to perform that it is practically impossible for them to make a minute examination of the district under their care, and often those districts are so extensive in themselves as to render careful examination of all parts of the workings and roadways impossible in the time limit before the shift. They are working much too long hours—10 to 12 and sometimes 14 hours a day being worked by these officials, and the measure of their efficiency is the amount of coal they can get out of their district rather than their attention to the ventilation, gas, and the safety of the working places.

(5) *Fines and Discipline.*—I do not agree with the enforcement of discipline by fines at the colliery, and was unaware of its being so frequently done until it was given in evidence before this Commission.

(6) *Special Rules.*—I think it would in some measure tend to a better observance of the Mines Act and Special Rules if in the first instance it was made obligatory upon the officials to supply every workman they employ with a copy, and would be further assisted if arrangements were made to distribute periodically printed copies of the portion dealing with spragging, timbering, riding on trams, care of safety lamp, &c.

(7) I think Special Rules should be prepared by the Secretary of State, after ascertaining the views of the owners and workmen, and should be confirmed by Parliament.

(8) *Accidents; Falls of Roof and Sides.*—I think a more regular systematic method of timbering would reduce the number of this class of accident.

(9) *Haulage Accidents.*—Travelling roads, independent of the haulage roads in which the hauling is done by machinery, should be provided, or such haulage roads should be of sufficient width to admit of a footpath clear of the trams. I am informed that in places where they have this width at present it is rendered useless for walking on by old timber, rubbish, &c., being allowed to accumulate.

Digitized by Google

Mr. T. Richards, M.P.

29 May, 1907.

(10) *Explosions.*—I would urge upon the Commission the necessity of an exhaustive inquiry into the best method of dealing with coal dust with a view of minimising the extent of any explosion that may take place, and, while leaving the question of watering and other scientific methods to those better qualified to deal with the subject, I believe that a closed tram filled only to the level will considerably reduce the amount of dust made by the transit of the coal. A large number of collieries make no provision for preventing the dust from the surface screens, &c., going down the shaft.

(11) *Safety Lamps.*—The present practice of allowing the colliery manager to select the type of lamp and the quality of the oil to be used is not satisfactory.

(12) Rule 8 requires alteration. I should insist upon the use of safety lamps in all ventilating districts where inflammable gas is found, and that safety lamps and naked lights should not be permitted in the same ventilating district.

(13) Firemen should report the presence of gas if found in their inspection during the working shift.

(14) *Ambulance and Rescue Work.*—Proper ambulance appliances, splints, bandages, stretchers, &c., should be kept in each district in the mine and not "at the mine." Provision should be made for dealing with an explosion at every colliery, and every appliance possible to assist rescue work kept in readiness, and workmen trained for the purpose.

(15) *Investigations into Mine Accidents.*—I do not consider the present system of coroners' enquiry satisfactory, and it should in all cases of serious accidents be supplemented by the investigation authorised by Section 45.

(16) *Sanitation.*—No case of ankylostomiasis in South Wales or Monmouthshire has come to my notice, but there is room for improvement in the sanitary condition of our mines in the interest of the general health of the miners.

19621A. (*Chairman.*) I observe that you deal, in the first place, with Government inspection, and you say that the number of Government inspectors is totally inadequate to secure anything approaching an efficient systematic inspection of the collieries. What would you call an efficient systematic inspection?—I would not call the inspection that is evidently being made at the present time, and the only one that can be made by the present staff of inspectors, an efficient systematic inspection.

19622. In what respect does that inspection fall short of the efficient systematic inspection you would like to see?—It is impossible for the present inspectors to make an inspection of any kind of all the collieries in their districts more than at intervals of twelve months, say, and in some cases, even, collieries are not inspected in that period at all. Then, as I understand, the inspection when it is made is not a systematic inspection of the colliery: part of the colliery is inspected, and that is taken to be representative of the whole. To me as a practical working miner it is astonishing that an inspector should sample a colliery like you would sample a piece of cloth, taking one piece to represent the other. I think it is a most dangerous practice.

19623. Most of the inspectors, I think, were fairly satisfied that they could do the work which they considered was necessary to be done in the way of inspection?—I have read some of the evidence given by the inspectors, and that is what I would like to call special attention to, viz., the statement that they examine a portion of the colliery and take that as being representative of the whole. I think it is quite possible that in one portion of a colliery everything may be perfectly safe and all the rules observed; whereas in another portion of a colliery some practice may be in operation that at any moment might upset the whole ventilating system, for instance, of the colliery.

19624. You think that under the present system it is quite likely that some practice of that kind, which might be dangerous to miners, is in existence in one part of the mine without the inspector knowing it, and which, in the case of an inspection of one part of the mine, and talking to the men or the manager, he would not be likely to discover?—That is so. We have several seams being worked in the same mine, for instance, and it is possible for things to be all right in one seam, whereas they might be quite the contrary in the other. I think it gives a false sense of security to both workmen and owners that inspectors should visit a colliery in this way, because they may base their calculations that everything is all right on the inspection, whereas the inspector is only inspecting a very small portion of the colliery.

19625. It would be the duty of the inspector not only to inspect part of the colliery, but to talk to the men and try to find out what was going on throughout the colliery?—The workmen in one district of a colliery would have no knowledge whatever of what was taking place in the other. They are strictly prohibited from going to any other place in the colliery but their own working place.

19626. But when they came to the surface they would meet together, and to some extent discuss anything in the mine?—That is so: and I have reason to believe that sometimes the attention of the inspector has been called by that method to some practice which ought to be attended to.

19627. Still, you do not think that is sufficient?—I do not think so.

19628. Although the attention of the inspector is sometimes called to matters connected with the safety of the miners in that way, still you think there may be occasions when something is going on in other parts of the mine which he knows nothing of?—That is so.

19629. You would deal with that, apparently, by the creation of another class of inspector. Would you increase the present class of inspector?—I see no objection to even increasing the present class of inspector, but I think that another class of inspector, not appointed by the present method of appointment, but by some other method of appointment, should be created.

19630. First of all, deal with the present class of inspector and assistant-inspector. Do you think that that class ought to be increased or not? Do you think there ought to be more than the 12 inspectors and more than the 26 assistant inspectors?—Yes.

19631. To deal first of all with the inspectors, do you consider the 12 inspectors a sufficient number?—I do not. I do not see how they can, even as chief inspectors, with the number of assistants they have, exercise really the functions of a chief inspector as they ought to be exercised. Let me give an instance. I think Mr. Martin is the chief inspector in one district, and he in his district has 382 collieries under the Coal Mines Act and Metalliferous Mines Act, and they employ 62,756 workmen.

19632. You think that Mr. Martin's district ought to be split up?—I think so. The area is so enormous, too, from Devonshire to Monmouthshire.

19633. You would probably say, in the first place, then that the class of principal inspectors ought to be somewhat increased?—I think so.

19634. How many would you suggest?—I would not like to suggest any number.

19635. Do you think that the present proportion of assistant inspectors to inspectors is the proper proportion, viz., about two to one?—No; I daresay a chief inspector could do with another assistant.

19636. You think there ought to be at present three assistants to every chief inspector, instead of two?—I do not see why he should not have three.

19637. I am dealing with the class of inspector which at present exists?—Quite so.

19638. Your suggestion is that the present class of chief inspectors and the class of assistant inspectors should be considerably increased, say by something like 50 per cent.?—I think so.

19639. You also suggest that another class of inspector should be appointed, one for every 10,000 workmen employed in the district. How many would that be on an average for each district?—I have not worked that out.

19640. There are about 800,000 workmen, and it comes to about 80 for the whole country?—It would be so.

19641. In each district you would have 7 or 8 of these inspectors?—Yes.

19642. According to you, you would have the district sub-divided, instead of into 12 districts, say 15 or 16 districts, and in each of those 15 or 16 districts you would have three assistants instead of two assistants under the present scale of pay, as I understand, and in addition to that you would have some six or seven of your class of inspectors, that is another class of inspector, in each district?—I do not want to suggest what increase should be made in the present staff of inspectors or the present staff of assistant inspectors; what I say is that the present number is certainly inadequate to perform the functions that we think the Government inspectors should perform.

19643. Your principal point is that in every district you would have six or seven, or perhaps seven or eight, inspectors of a different class?—That is my chief point.

Digitized by Google

19644. How much do you suggest they should be paid ?—I do not think I should suggest the salary, either.

19645. Or whether they should be appointed by the Home Office, as the other inspectors are ?—I am not quite satisfied even that the method of appointing the present inspectors is the very best method.

19646. How are the present inspectors appointed ?—I understand the method of appointment at present is that the Home Office has the nomination absolutely.

19647. (*Mr. Cunynghame.*) It is not absolute: they nominate a number of people to compete ?—Unless nominated they cannot sit for a competitive examination.

19648. It is not an open competitive examination ?—It is not.

19649. (*Chairman.*) Do you suggest that there should be open competition ?—That is my suggestion.

19650. That is, if anyone wishes to be a mines inspector, and succeeds in open competition, then he should be appointed ?—Yes.

19651. (*Mr. Enoch Edwards.*) What is meant by "anyone" which his Lordship puts in his question ? It must be a man with some knowledge ?—I take it no one would enter a competitive examination unless he had some special qualification.

19652. (*Chairman.*) At present I understand no one is allowed to compete who has not served for a certain number of years in a mine, or passed a certain examination ?—Quite so. I did not mean that you should remove those restrictions, of course.

19653. You would keep those up ?—Yes. I have gone upon the assumption that the Home Office would not think of appointing an inspector who was not in possession of a colliery manager's certificate.

19654. Would you suggest there should be some sort of provision for the appointment of mines inspectors, as there is for mine managers, and that a man must have some practical acquaintance with a mine, or something of that sort ?—I would. I quite agree with what has been said here, and I do not think we have any complaint with respect to the inspectors appointed even under the present system: still, it is open to this, that they might be appointed without having any practical knowledge of mines at all.

19655. You would like some sort of rule as there is laid down for managers, that no man should be allowed to sit for an examination, we will say (supposing that it was necessary for a mines inspector to pass an examination), who had not a practical acquaintance with mines. Now it is not necessary, as I understand—a mines inspector has only to pass an examination, because the Home Office says he must pass an examination, but the Home Office might say to-morrow, "We will appoint anyone without an examination," as I understand you ?—That is so.

19656. The only statutory requirement is that the Secretary of State must appoint a fit person ?—Yes.

19657. You suggest definite rules should be laid down by Act of Parliament restricting the class of persons who might be appointed mines inspectors by the Home Office ?—I do.

19658. And the same would apply to assistant inspectors, I suppose ?—Yes.

19659. Then with regard to the third class of inspectors, you suggest that in the same way they should be subjected to some kind of examination ?—Yes. You will notice I have said, I think, that preference should be given to those who hold a certificate of competency under the present Act, viz., the colliery manager's certificate.

19660. Either a manager's or under-manager's certificate ?—No—manager's certificate.

19661. (*Mr. Ratcliffe Ellis.*) They are all manager's certificates, but they are first and second class ?—Yes—first class, I mean.

19662. (*Chairman.*) Do you think that you would get a great many people who have passed this first-class examination to compete for this third class of inspectorship ?—I think so.

19663. In that case I suppose they would have to be paid fairly well ?—Yes. We have a large number of colliery workmen, at present, who hold these certificates.

19664. First-class certificates ?—First-class certificates, and they are, at present, ordinary colliers.

19665. How are they paid ?—They are only paid the ordinary collier's wages.

19666. And many of them have obtained a first-class certificate ?—Yes, and a greater number still have the second-class certificate only, because they have no opportunity of getting a position, and there is no inducement for them to go for a first-class certificate.

19667. But they would be capable of obtaining a first-class certificate, you think ?—I think so.

19668. Have you any idea what sort of proportion of ordinary colliers would be capable of obtaining a first-class certificate ?—I have not.

19669. A good many ?—I think a good many.

19670. (*Dr. Haldane.*) They are usually firemen, or men holding some official position ?—No, I mean the ordinary working colliers who attend mining classes and qualify during their spare time, and still follow their occupation. That is one of the few complaints we have against the colliery owners, that these men are not given the position of firemen, although qualified, and have obtained a second-class colliery manager's certificate: but other men, without those qualifications, working in the same pit and in the same district, are often appointed firemen.

19671. (*Chairman.*) You propose to make some alteration in the working of Rule 38, and you say that Rule 38 should be amended so as to permit the appointment by the workmen of persons as examiners "who are" or have been "practical underground workmen." The words of the Act now are: "may from time to time appoint two of their number or any two persons, not being mining engineers, who are practical working miners." What is the difference ?—The difference is the interpretation put by some colliery owners, viz., that a practical working miner must be a hewer. Some colliery people interpret those words as confining the selection of these examiners to those who are hewers.

R 38

19672. (*Mr. Smillie.*) And have not the Law Courts held that to be so ?—I think so.

19673. (*Mr. Ratcliffe Ellis.*) In the Act of Parliament, Rule 38, it is: "who are practical working miners," and Mr. Richards' amendment is "who are, or have been, practical miners" ?—I would make another alteration: "who are, or have been, practical underground workmen" I want to call them "practical underground workmen" and not "practical working miners": because that has been interpreted to mean that it is only the man making up the coal at the face who is eligible to be appointed under this Section, whereas we say there are men filling other occupations in the colliery who are sometimes better qualified to make this examination, and who know more about the colliery in consequence of working in one district to-day and another district to-morrow, timber-men, for instance.

19674. (*Chairman.*) You say anyone who has been a practical worker underground ought to be eligible ?—That is what I say.

✓

19675 And also you would agree that they might have the power to appoint any practical miner even though he did not belong to that particular mine ?—Yes.

✓

19676. There has been a difference of opinion about that, and I am told there is a good deal of feeling sometimes shewn by the men appointing as they sometimes do. I understand, a man from another mine to go down their mine: and the managers say "We do not care about a man employed in another mine looking into our mine and we think that the miners ought to be confined to choosing a person who is at present at work in the particular mine." You would not so limit them ?—I would not.

19677. They are certainly not limited in that way at the present time ?—There has been a good deal of difference of opinion as to whether that is not the meaning of the Act. There was some correspondence in the South Wales District with reference to that recently.

19678–9. It seems to me on the rule that is not so. The men have a right to appoint a man from another mine, but that is only my reading of it ?—Well, there has been a good deal of correspondence upon it in reference to a particular appointment.

19680. (*Chairman.*) You say that from some cause or other the workmen do not use the power given them in Rule 38 as extensively as you think they should do. What cause do you suggest for that ?—I think one cause that the workman does not care to use the power may be that there is a probability of his being obliged to make an unfortunate report of the colliery at which he is employed, and he rather shirks doing it if he can.

19681. He does not wish to get into the bad books of the manager ?—That is so.

Digitized by Google

Mr. T. Richards, M.P.

29 May, 1907.

19682. Have you had any experience of that ? Has any workman told you that that is the case ?—I have heard that, but I do not say recently. Perhaps within the last nine or ten years we could not cite cases of a workman being harshly dealt with in consequence of some unfavourable report ; but prior to that it was frequent that workmen complained that, after having made an unfavourable report of the colliery they were dismissed, and if not dismissed their lives were made unbearable.

19683. That was nine or ten years ago, but that state of things has altered for the better you think ?—Very much for the better I think.

19684. And the men are now pretty secure : and if they only make a truthful report of the mine, even though they may find fault with the working, and very often probably justly so, the manager will not treat them badly in consequence ?—The workmen would rather not be put in that position.

19685. Although they feel that security, they would rather not be put in that position ?—They would rather not.

19686. Notwithstanding the fact that for the last nine or ten years you know of no instance in which they have been dismissed or in any way injured by giving a true report about a mine ?—Quite so. It ought not possibly to be so, but I am told that in some districts the reason why the workmen do not use this power as frequently as they might is because of the expense. They have to pay the men for doing the work, and where men are earning low wages that is an additional reason why it is not done so often.

19687. As regards inspection under General Rule 4 by the officials of the mine, you say that is very unsatisfactory, because the management may appoint persons who have not the special qualifications necessary to perform the duties of firemen, and there is no test of fitness, and you urge a qualifying examination and certificate of competency ?—I do. I may here revert to the question of the workmen holding certificates. A large number of workmen having qualified for second-class colliery managers' certificates are still employed as ordinary colliers, while men who have taken no steps whatever to qualify themselves—theoretically, anyhow—for the position, have been appointed to these important posts, who have been working in the same district and in the same colliery.

19688. To what do you attribute that ? Surely it is to the interests of the managers to appoint the best men, and it would seem against their own interests that the best qualified persons should not be appointed ?—Yes, if they confined the duties of the firemen to what we think they should be confined, simply and solely to the continual examination of the district under their care. Their whole attention should be applied to the examination of the district, and then it would be more to the interest of the colliery owners themselves, and they would take more interest in appointing men who are qualified in that respect. But so many duties are put upon the fireman that I am afraid it is sometimes the man who has the most influence and command in getting hauliers to drive coal rapidly, and other men to do some other kind of work rapidly, who has the qualification which is looked upon with favour rather than the one who has the qualification of dealing with the safety of his district.

19689. You think the qualification looked for is the power of driving the men and making them do the most work ?—That is the one which I am afraid is chiefly looked for. In fact, I have instances within my own knowledge where a fireman whom we have thought had been an exceedingly careful fireman and a man very attentive to the examination of his district, and instructing the workmen with respect to the timbering of their places, and so on, has been taken from that district and put in another district and has been taunted in a few weeks time by the manager with the amount of coal that is got out of that district since he has been there, while the other man has come and devoted his attention to seeing that the men have sufficient trams to fill, and so on.

19690. You think they should be kept separate ?—Yes.

19691. One man to look after the inspection and the other the quantity of work done ?—Yes.

19692. On the other hand, the miners are paid for the work they do. If they do not get a certain quantity of coal they do not get their full wages ?—Certainly. I quite agree it is an important part of the management of a mine to see that the workmen get sufficient trams and timber, and so on, but I do not think it ought to be the duty of the special officials—I think their duty ought to be confined absolutely to the examination of the safety of the mine. and they ought not to have anything to do with the traffic of the men.

19693. You do not agree with the enforcement of discipline by means of fines ?—I do not.

19694. Do you think that in almost every case a man ought to be taken before the magistrates if he seriously neglects his duty ?—Yes. If he has committed a breach of discipline that necessitates any measures at all being taken, then he should be taken before the magistrates.

19695. You think that for a small breach of discipline he should be simply cautioned ?—Yes.

19696. And for anything serious taken before the magistrates ?—Yes. To put it shortly, I do not believe in the colliery office being a police-court.

19697. However, you think that some of the men themselves might prefer to be fined ?—That is undoubted, I think—otherwise it could not have been done to the extent it has.

19698. You think it would tend to a better observance of the Mines Act, and Special Rules if in the first instance it was made obligatory upon the officials to supply every workman they employ with a copy, and that printed copies dealing with particular parts should be distributed periodically ?—I think there are thousands of workmen at present who know absolutely nothing about the rules. They either do not know they are entitled to receive a copy, or, if they do know, they do not go to the office to fetch it. The provision under the present arrangement is that the owners must give a copy of the rules if the workman applies for it. I say it should be part of the engagement of the workman, when he comes to sign on, that the official signing him on should give him a copy of the rules.

19699. And if the rules are altered at any time then he should have an altered copy at once given him ?—Yes.

19700. You think it is desirable that Special Rules should be prepared by the Secretary of State after ascertaining the views of the owners and workmen, and that they should be confirmed by Parliament ?—Yes.

19701. What machinery do you suggest for ascertaining the views of the owners and workmen ?—There might be a joint conference with the coal-owners and the workmen and the inspectors.

19702. You think that before any Special Rule is propagated by the Secretary of State there should be something in the nature of a conference between the workmen and the managers, and that no Special Rule should be put before the Secretary of State or Parliament for confirmation until the men had been in some way officially consulted ?—I think it would tend to a better observance of those rules the more they were discussed before they were put into operation, and the more attention was called to them.

19703. You say you think a more regular and systematic method of timbering would reduce accidents caused from falls of roof and sides. There have been Special Rules dealing with systematic timbering and unfortunately they do not appear to have reduced that class of accident at all. What further rule do you suggest ?—I understand the rules that are in operation at present are largely in the hands of the manager of the colliery, who has to fix the maximum for the setting of any timber ; and I am afraid that in some instances the maximum has been too great.

19704. You would leave less discretion in the hands of the colliery managers ?—Even with respect to this too, a joint conference would possibly be the best means of dealing with it. If an agreement could be arrived at between the colliery manager, after consultation with the Home Office, and the workmen, as to the requirements in a particular seam, perhaps that would be the best method.

19705. That might take some time ? True, it might take some time.

19706. That would cause considerable delay and loss in the working of a colliery, I suppose, if you had to take all these opinions before you were able to timber a new seam ? —So far as regards Monmouthshire, that has been done : and I understand it was failure to agree really as to the fixing of some method, or agreeing upon some method, that ultimately led to each manager being allowed to fix his own maximum.

19707. Do you think that any General Rule could be laid down by Parliament with advantage with regard to timbering ? Have you any suggestion to make with regard to that ?—I am afraid the variety of seams and conditions makes it rather difficult for Parliament to lay down any General Rule.

Digitized by Google

19708. Your suggestion is that it should be taken out of the hands exclusively of the managers and put into the hands of the workmen and the managers together. That they should together decide rather than the manager alone ?—And the Inspectors.

19709. You think those three parties should consult together ?—Yes.

19710. And they should put forward certain Special Rules applicable to a particular mine or particular seam, and that those rules should be observed just as other Special Rules are observed ?—Yes.

19711. You say that travelling roads, independent of the haulage roads, in which the hauling is done by machinery, should be provided, or that such haulage roads should be of sufficient width to admit of a footpath clear of the trams ?—Yes.

19712. As regards that suggestion you say you are informed that in places where they have this width at present it is rendered useless for walking by old timber, rubbish &c., being allowed to accumulate ?—That is so.

19713. Are there no Special Rules for preventing that accumulation of old timber and rubbish ?—No, only so far as the approaches to the man-holes are concerned.

19714. You might have a gangway of sufficient width between the trams and the sides for a man to walk on: and that precaution might be rendered absolutely useless by an accumulation of all sorts of rubbish ?—I am told that is so now in a good many instances.

19715. Do you suggest that there ought to be some General Rule to the effect that all gangways should be kept clear in the haulage ways ?—I think as a general rule, especially in laying out new collieries and new districts, it would be better to have a separate travelling way instead of the men having at all to walk past where the machinery is in operation. It would not be impossible anywhere, but there might be some instances in the case of collieries now at work where the expense would be enormous. I do not want to close my eyes to that—still, all haulage roads should be of sufficient width to allow the men to walk clear of the trams.

19716. Independent of the man-holes ?—Independent of the man-holes.

19717. And independent of the travelling ways ?—Yes.

19718. Suppose you had a travelling way, so that it was not the least necessary for the men to go on the haulage roads at all: would you still say you ought to have them of sufficient width as to admit of a footpath clear of the trams ?—It would still be desirable, because there would be still a certain number of men who would have to go that way.

19719. (*Dr. Haldane.*) You do not include horse haulage —you mean engine haulage ?—Yes, engine haulage.

19720. (*Chairman.*) With horse haulage you would have more men to look after the trams than in the case of engine haulage ?—There is not the same danger with the horse haulage as there is with the engine haulage.

19721. You say that where now there is a sufficient gangway to enable a man to walk between the trams and the sides, still that provision is made nugatory by the gangway being filled up with rubbish ?—Yes.

19722. Would you suggest there should be any General Rule to prohibit such a thing taking place ?—Yes.

19723. A General Rule to say for instance that all gangways where men have to walk along should be kept clear of rubbish so far as possible, or something of that sort ?—Yes, I would.

19724. There is no rule to that effect anywhere ?—I think not.

19725. General Rule 16 says "Every manhole and every place of refuge shall be constantly kept clear and no person shall place anything in any such man-hole or place of refuge." What does "every man-hole and every place of refuge shall be constantly kept clear" mean ?—A man-hole and a place of refuge is the same thing. I have already said the man-holes are kept clear under that rule.

19726. It seems to me it is practically an infringement of that rule if you block up the gangway at all: because at any moment a man may be walking along between two man-holes, and, on account of there being a lot of rubbish about, he could not get into a man-hole. Suppose he was caught an equal distance between the two man-holes and there was a lot of rubbish between the two man-holes, I should have thought that would have been a practical breach of rule 16 ?—It is very frequently so. I should say if you went down a South Wales colliery to-morrow you might find every man-hole quite clear, and the direct approach to it kept clear, but between the man-holes you will find either a heap of rubbish or possibly old timber, or some obstruction or another.

19727. (*Mr. Ratcliffe Ellis.*) Along the part which the men have to travel ?—By the side of the road.

19728. Along which the men have to travel ?—Yes—they walk between the rails.

19729. (*Dr. Haldane.*) They can get to safety provided they can get to the manhole in time ?—Yes.

19730. (*Mr. F. L. Davis.*) You do not suggest that is a general practice ?—I do not, but I say it often happens there is no obligation put upon the colliery owner to see that those accumulations are not allowed to exist—in fact, there is no rule at all providing that they should have sufficient width to start with.

19731. (*Chairman.*) But where there is sufficient width it might be quite possible that although Rule 16 was kept to the letter the men might be caught between the two man-holes and not be able to get to either, because of the accumulation of rubbish ?—Yes, simply because of the want of a little care and attention.

19732. There would be no means of his immediately stepping off the line into safety ?—Quite so. Another point which I wish to make is this; there are a large number of accidents taking place in the collieries in consequence of the breakage of shackles, that is the coupling used between the trams. The practice is that a shackle is sent into the mine and until it breaks it is used. I think there should be some periodical inspection, and that all the shackles should be taken out and put through some process to find out whether any fracture or weakening has taken place.

19733. You think there should be some testing ?—Yes.

19734. Do you know if there is any testing in the case of railway wagons ?—I do not.

19735. (*Mr. Smillie.*) There is a periodical examination, and if the shackles get worn they are taken off ?—I do not think there is even that in connection with the shackles in a colliery: they are made and sent in, and, until something happens to them, no one thinks of examining them.

19736. (*Mr. F. L. Davis.*) Are you suggesting that applies to horse haulage as well as to mechanical haulage, or more especially to mechanical haulage ?—To both haulages. There have been a number of accidents with horse haulage on steep gradients in consequence of the breaking of the shackles. A shackle may be damaged; it is the same shackle which comes down with the mechanical haulage, and the same shackle is used to take the trams into the working places, and horses have to take them up steep gradients.

19737. (*Chairman.*) Under General Rule 5 "A competent person or competent persons appointed by the owner, agent, or manager, for the purpose, shall once at least, in every 24 hours examine the state of the external parts of the machinery, the state of the guides and conductors in the shafts, and the state of the head-gear, ropes, chains, and other similar appliances"—which would include shackles ?—I am afraid it does not. That applies to the machinery in connection with the shaft itself—that is the rendering of it, anyhow.

19738. "And other similar appliances of the kind which are in actual use both above ground and below ground." You read that in connection with shafts ?—That is the rendering of it.

19739. (*Mr. Ratcliffe Ellis.*) The words are "and other similar appliances of the kind which are in actual use both above ground and below ground" ?—That might be intended to apply to it.

19740. It is more honoured in the breach than the observance ?—Honoured absolutely in the breach. I have worked nearly 20 years in a mine, and I have never known an inspection of shackles to take place.

19741. (*Chairman.*) You urge upon the Commission the necessity of an exhaustive inquiry into the best method of dealing with coal dust with the view of minimising the extent of any explosion. We are doing that, I may say. You say you do not wish to say anything about watering and other scientific methods, but you suggest that a closed tram, filled only to the level, would considerably reduce the amount of dust made by the transit of coal. We have had a good deal of evidence about those trams, and, I think, no one has suggested that it would be practicable to have trams with closed tops, although many persons suggested you should have all four sides closed, so that no dust could

Digitized by Google

Mr. T. Richards, M.P.

29 May, 1907.

escape ?—I suggest that the coal should not be packed above the level of the tram. The practice in South Wales is to pack the coal above the level of the tram altogether. We have the coal piled up a foot, half a yard and two feet above the level of the tram.

19742. You think that results in a considerable quantity of dust being scattered over the haulage road ?—It must do, I think.

19743. And you think that might be easily avoided without any great expense ?—Yes ; it is only a question of improvement in the type of tram. They should get a tram high enough to carry the coal closed sides and end.

19744. And made as high as the coal now goes up ?—Yes.

19745. You say a number of collieries make no provision for preventing the dust from the surface screens going down the shaft ?—Yes.

19746. You suggest such provision should be made ?—I do not know what the engineering difficulty is about it, but certainly, the colliery screens, in some instances, are situate very close to the mouth of the down-cast shaft, and some of our coals being very dry, clouds of dust appear every time a tram is tipped, and a big percentage of that must find its way down the shaft. As I say, I do not know what the engineering difficulty is, but I am told that steps are taken at some collieries to prevent this dust going down.

19747. We have had a good deal of evidence on that point. One suggestion is that on the opening of new pits the surface screens should not be placed near the shaft, but should be some distance off ; and where they must be near the pit, then some system of collecting the dust by currents of air, or something of that sort, should be resorted to, so that it does not find its way down the pit ?—I think so.

19748. You say that the rule with regard to safety lamps requires alteration. Would you suggest that the type of lamp should be tested, say, at headquarters ?—I think so.

19749. And the quality of the oil ?—Yes. I may say I have read several times the Report of the Commission which reported, I think, in 1886. There were very many important recommendations by that Commission which have not been attended to, I think. If I remember rightly there was this one ; the Commission recommended a permanent investigating Department, or a department for research with respect to these matters. I may not be accurately quoting what they recommended, but they certainly recommended something which has never been attempted or done, so far as I know, since that Report was issued ; and we are still going on allowing each manager to select his own type of lamp.

19750. In some mines they have a type of lamp that permits the workman to put the flame up and down, and in some mines that is prohibited. Do you think there is any danger in a lamp that enables a workman to put the flame up ?—Yes ; I think it is better that he should be deprived of any opportunity of interfering with it at all—if you have a lamp which can as easily serve his purpose.

19751. (*Dr. Haldane.*) He cannot test for gas then ?—We say the ordinary workman ought not to test for gas at all.

19752. (*Chairman.*) That should be restricted to the persons with first-class certificates ?—No, to the firemen—those are the men I attach the greatest importance to in a colliery.

19753. I thought you said they should have a first or second-class certificate ?—Yes, I did ; and they should have fewer duties to attend to than they have at present, and be confined to examining for gas and assisting the workmen.

19754. (*Mr. F. L. Davis.*) Do you suggest a lamp that does not need trimming ?—Yes, if you can get one, and, I think, there are some in use at present

19755. But not capable of lasting the whole time the man works, I think ?—Perhaps not.

19756. A large number trim their own lamps ?—Yes, they have a kind of wire pricker going up through the body of the lamp.

19757. (*Chairman.*) If he likes he can push it up ?—Yes, he can push it up.

19758. (*Mr. F. L. Davis.*) What is your objection to it ? Is it safety ? This is supposed to be a safety lamp. What is the objection to putting the flame up a little ?—That is a point which I did not suggest myself.

19759. Do you think there is any danger in it ?—Of course there is the possibility of a workman recklessly pushing it up and getting a big flame, but I do not know that there is any very great danger.

19760. (*Mr. Smillie.*) A person of very little experience with gas or safety lamps, and who did not know the danger, could put up that flame to a point that would render the lamp dangerous ?—Yes, if he was working in gas. Of course a workman immediately finds out if he gets too big a flame in the lamp because it smokes and the light is consequently affected.

19761. (*Chairman.*) You say you would insist upon the use of safety lamps in all ventilating districts where inflammable gas is found, and that safety lamps and naked lights should not be permitted in the same ventilating district ?—Yes. The rule at present is that no naked light should be used between the points in the ventilating district where it is necessary to use safety lamps and the return airway. I think naked lights should not be used at all in that ventilating district.

19762. You think there ought to be some General Rule to that effect ?—A General Rule. If it is necessary to use a safety lamp at all in any separate ventilating district, then I do not think naked lights should be permitted in any portion of that district.

19763. You think that might be made a General Rule to apply all over the country ?—Yes.

19764. And you say that firemen should report the presence of gas if found in their inspection during the working shift. Is that not so now ?—No. I understand he is only compelled to make a report of his inspection made before the working shift.

19765. Would he not, as a matter of fact, if he found gas at any time, report it ?—I think not.

19766. He is not obliged to ?—He is not obliged to.

19767. You think he should be obliged to ?—Yes.

19768. That might be made a General Rule ?—Yes, it might.

19769. You think that proper ambulance appliances, splints, bandages, stretchers, &c., should be kept in each district in the mine and not "at the mine." What do you mean by "in the mine" ? Do you mean down the pit ?—Yes, down the pit. I see no difficulty in each large working district keeping stretchers, bandages, and splints, which might not only considerably relieve an injured workman immediately, but might in some instances save life, instead of having to send out to the top of the pit as they have at present. The general interpretation put upon General Rule 34 is that, if they keep in the colliery office at the top of the shaft, two miles away often from where the workman might be injured, sufficient splints, bandages, and stretchers, they have complied with the Rule. The expense would not be great, and the opportunity of relieving suffering, if not saving life, by having the appliances immediately at hand, I think, is very important indeed.

19770. (*Mr. F. L. Davis.*) You mean just keep them stored at the bottom of the pit ?—Some place in the pit. I do not think there would be any difficulty in keeping a suitable iron box in each district in the pit.

19771. (*Chairman.*) The words are "at the mine." The mine might include a number of pits ?—It might, but I think the interpretation put is that they must have these appliances at the office at the top of each pit.

19772. You would say at the bottom of each pit instead of at the top ?—Yes. I do not mean at the bottom of the shaft, because that is only a matter of a few hundred yards from the top, and not much saving of time ; I mean actually near the working face—near at hand.

19773. (*Mr. Ratcliffe Ellis.*) The Rule requires that they should be ready for immediate use ?—Yes, but that is the interpretation. Speaking as an ambulance medallist, a man, by having proper splints or appliances to make a proper tourniquet, might save another man's life.

19774. They ought to be required to keep them in some place where they could be kept in order ?—Yes, that is an important point.

19775. (*Chairman.*) It would be rather a trap if they were kept in places where they were apt to be neglected and people said, "Here they are close by and we can get at them at any time," but when the necessity arose they found they were not in proper working order ?—I would relieve the fireman of some duties, but I think there would be no difficulty in putting this duty upon him : that he should examine these every day in the same way as he would examine his district.

Digitized by Google

19776. You say that provision should be made for dealing with an explosion at every colliery, and every appliance possible to assist rescue work kept in readiness, and workmen trained for the purpose. We are all agreed there, but I do not know whether you have any detailed views you would like to put before us upon that?—No, I have not, other than this: I want to say that I believe the workmen generally now are beginning to feel that they have been criminally neglected in this respect. You get a big explosion, as we have had in South Wales, where a couple of hundred men have been killed; there is consternation at the colliery because no one has any instructions at all what to do in an emergency. There are no appliances of any kind; that is a simple precaution which might have prevented some of the men losing their lives who have gone in immediately after an explosion. I am not prepared to say what appliances there are which might be used at present, but I do desire to say this, that all these kind of mechanical arrangements are only perfected by experiments. Take the case of the appliances which we have for dealing with fires in a large town. What would happen if that took place which always takes place in the case of miners where there is no apparatus and where they say, "There is nothing we know of that can be of any service." That is the attitude which has been taken up.

19777. Attention is being seriously called to this matter of rescue appliances?—I hope this Commission will treat it as one of the most important features that they should give attention to. I believe, to start with, that it would be possible to train all the men working at the top of a large colliery. If you have a large place of entertainment, generally the attendants are trained as to what they are to do in the case of a fire. Here you have a mine with, say, a couple of thousand men going down every day and with the possibility of an explosion, but there is not a word of instruction of any kind, either verbal or printed, or anything else, given to anyone as to what they are to do if an explosion takes place.

19778-9. You think there might be lectures given?—Yes, and I think that every one of the large number of men employed at the top of the colliery—the banker, the engineman, the smiths and carpenters, and other practical men who are there—might all be trained so as to know his duty when an explosion takes place. I feel very strongly about this, I must say. I have said so publicly on platforms, and I have said so in Parliament. I think the mining population has been criminally neglected, and that absolutely nothing has been done. Take the collieries we have recently had explosions at. At one, a recent big explosion, I put it to the colliery proprietor himself, "Has there been anything done at your colliery which was not done before the explosion with respect to teaching men at the top of the pit what to do in case another explosion took place?" and he had to admit that when the workmen went in they forgot about it—everybody forgets about it until another explosion takes place. I was at the top of a colliery within half an hour after an explosion took place, and the manager, poor fellow, of course he had rushed down; we have no complaint to make in that respect. The manager and the officials generally risk their lives instantaneously, and it is a reckless risk of life, and often a useless risk of life. A large number of practical people were there ready to go down to see whether it was possible to save life or not, but there was no one at the top of the colliery to take charge. The manager had rushed down the pit, and nobody else was allowed to go, and for two hours nobody was allowed to go down the colliery to see whether anyone might be saved or not. Personally, I feel very strongly if a beginning was made, no matter how simple it was, it would be a good thing, and by experience we should gain in this matter, as we have gained in other matters. Of course, if people dealt with torpedoes, for instance, or submarine boats, in the same manner as we are dealing with appliances for entering a mine after an explosion, we should have had no submarine boats. It is because they hung on to the faintest hope of being able to do this, and experimented time after time, that ultimately they were able to produce a boat to go down below the surface of the water; and I say that is the attitude we should take up with this important industry and the great risk to life which is caused by these explosions. I do not wish to say any more about it.

19780. We have been going into this question of rescue apparatus very carefully?—What I consider equally important is that something should be done to teach all concerned what they are to do if an explosion takes place, because they are responsible at the top of the colliery.

19781. With regard to investigation into mine accidents, you do not consider the present system of coroners' enquiries satisfactory, and in all cases of serious accidents you think that enquiry should be supplemented by the investigation authorised under Section 45 of the Act, which says that where it appears that a formal investigation of any explosion or accident is expedient, the Secretary of State may direct such investigation to be held. Do you suggest that the Secretary of State should have it in his power either to grant or to veto a second enquiry, or do you think that there ought to be some power given to a certain number of men to insist upon a further investigation irrespective of the veto of the Home Secretary?—Yes, I do.

19782. If, for instance, a certain number of workmen in a mine were to demand further investigation, you think that investigation should be granted, as a matter of right?—Even preferable to that, I think, if a number of workmen are killed, as a matter of course, this investigation should take place.

19783. Does not the coroner's enquiry generally bring out all the facts of the case?—No, I think not—well, the facts of the case, possibly, as attendant upon that particular accident, but there are often cases when questions are not permitted by the coroner because he does not see the relevancy to that particular accident which practical men can see, and which, we think, would be permitted under some other court.

19784. Have you yourself had any experience of coroners' enquiries?—Yes.

19785. Have you attended many?—I have attended a large number.

19786. Your opinion is that in some of those cases, at all events, some fresh facts might have been elicited by a second enquiry?—Yes, and in some of those cases, in my opinion—of course, I may be wrong—I have felt the coroner has not permitted the questions to be put that ought to have been put.

19787. You say that from your own experience?—Yes, and I think, with regard to the enquiries we have had in two recent explosions, to name two, the Elba and the Genwen—at Genwen the manager has since been prosecuted by the Home Office, I understand, and has been fined £20 for one of the most appalling neglects of duty it is possible for a colliery manager to be guilty of. I leave that to the Commission to see from the evidence at the coroner's enquiry even.

19788. (*Mr. F. L. Davis.*) What was the breach of duty?—There were numbers of them. I do not remember them now; I have the particulars here, but I thought you might see them for yourself.

19789. (*Chairman.*) How would the case have been strengthened against him by further enquiry? You had this enquiry which brought out that he had been guilty of neglect of duty. Supposing that there had been a further enquiry, what more would you have got out in that case?—I think the Court should have some power of suspending his certificate.

19790. That is another matter?—Here he has been fined £20, and he continues to be a manager.

19791. That has nothing to do with the second enquiry. The point at issue is whether a second enquiry is necessary in order to elicit useful facts which are not elicited at the coroner's inquest?—Perhaps not, in that particular case.

19792. Then you proceed to give an instance which it seems to me does not bear out your contention. The instance you give is where a manager was convicted of a very grave offence. It does not appear, from that instance you give, that any further facts would have been elicited by a second enquiry. You acknowledge the first enquiry did bring out the circumstance that he was guilty of a neglect of duty?—No doubt in that case it did.

19793. But you still adhere to your opinion, you do consider that at coroners' inquests the facts are not invariably fully investigated, and that in some cases, at all events, and you say, in all cases where a very serious accident occurs, it would be desirable to have a second enquiry under which a more complete investigation could take place?—I do.

19794. You say that you know nothing of ankylostomiasis in South Wales or Monmouthshire, but that you think there is room for improvement in the sanitary condition of our mines in the interest of the general health of the miners?—Yes.

19795. What have you to say with regard to that?—I think everybody is allowed to go largely as they please with respect to this matter, and, I think, that some instructions

Digitized by Google

Mr. T. Richards, M.P.

29 May, 1908.

may be issued to the miners generally. I do not think there is very much cause for complaint.

19796. The miners, themselves, would rather resent any very elaborate system of sanitary conveniences underground ?—I am afraid they would.

19797. You are afraid they would not make use of them ?—Yes.

19798. You do not lay very much stress on it ?—No.

19799. (*Mr. Cunynghame.*) I suppose you would not propose that there should be an enquiry in every case, or nearly every case, where a coroner's inquest had been held already. I will put it this way. What are the fatal accidents per annum, 700 or 800 ?—About 1,100.

19800. It would not be necessary to hold a separate enquiry in the vast majority of those accidents, for instance, where a man is killed by the improper setting of a piece of timber, or something of that sort. You would admit that the whole thing would be brought out before the coroner's jury with the inspector to help him, and all parties represented ?—Perhaps it is the explosions more especially, that I had in my mind. I think, no matter how many were killed, whether they were a few or many, that we should have, after an explosion, a special enquiry.

19801. Are you acquainted with any case, except one that occurred last year, where a subsequent enquiry, after the coroner's inquest, would have really thrown any additional light on the facts ? Can you name any case which you have in your mind ? The one last year resulted in the appointment of this very Commission, I mean the one in June ?—Yes.

19802. Apart from that, do you remember any case ?—There was one that we felt very strongly about at the time, and I think we approached the Home Office by deputation, met the Home Secretary, and pleaded for an enquiry. I have not the particulars fresh in my memory at the moment, but I think it is the Abertysswg, the MacLaren Pit in the Rhymney Valley.

19803. I should have liked to have had particulars of that.—I ought to say perhaps one of the Commissioners, Mr. Smillie, was present at that enquiry, and would be able to give the Commission more particulars than I can remember at the moment.

19804. If you were to give a right to a subsequent enquiry wherever a man had been killed, it would often be asked for by people who would say, "Let us have the enquiry ; we have not to pay for any part of it, and we may as well have it and see what will come of it." Do you not think it would lead to an amount of useless expense ? The revenue of the country is not illimitable, and these enquiries, if held by efficient men, cost a great deal of money before they are done with.—If they ultimately result in lessening the number of accidents it would be money well spent.

19805. I quite agree, but you are aware that in these cases we have the Report of a barrister who is sent down specially to look into the case, and also the Report of an inspector who goes thoroughly into the reasons. It is gone into by both of them. I was asking, rather, can you point to any case—I fail to see them in fact—where these men between them have not got to the bottom of it ?—I think we were especially dissatisfied with this Abertysswg case.

19806. Perhaps your complaint would be rather this ; you put it quite frankly: you do not think that the Home Office has exercised sufficiently the powers given under General Rule 45, and you think that if those powers were more exercised in future it would content you. It really comes to that, does it not ?—And, if you will allow me to say so, that the Home Office should give more consideration to a generally-expressed desire. Surely for men who have to risk their lives in these collieries the expenditure of a few pounds upon an enquiry ought not to stand in the way.

19807. If it was for no other purpose than to give contentment and satisfaction to a number of men whose lives may be in jeopardy, that would be a fair reason for holding a certain number of enquiries, at all events. That is your point ?—Yes.

19808. I suppose it would come to this : if the Home Office acted as you wish, there would not be a great number of these enquiries after all which would be desired ?—No.

19809. There has not been any request for an enquiry in more than a few cases ?—Probably not.

19810. Probably, if something were done in the direction of holding a few enquiries that would content you and be all that you want ?—It might.

19811. In the case of asking for an enquiry, you would give some discretion to someone not to have utterly useless enquiries asked for. May there not be persons who are fond of enquiries and who would ask for them in most of the 1,100 cases ?—There may be.

(*Mr. Enoch Edwards.*) In some cases the Miners' Federation asked, and they were refused.

19812. (*Mr. Cunynghame.*) I see Mr. Richards' point. I think I put it to you, in your way of thinking, fairly ?—I would not like to say that we want a special enquiry after every single accident or loss of life, as you put it. In some cases the Coroner's Court gets at all the facts possible, and I would not think of having an enquiry of that kind in such a case as that. What the Miners' Federation feel perhaps rather aggrieved about, rightly or wrongly, is this : notwithstanding the opinion of the Home Office that all the facts have been brought out, they have felt upon several occasions that there ought to have been a special enquiry.

19813. To put it plainly, it is not so much the law you are complaining of as laid down here, but that you think it might have been more liberally interpreted by the Home Office ?—Yes, I think so.

19814. That is plainly what it comes to, does it not ? Now as to the third class of inspectors you are speaking of, those would be what one might call working-men inspectors ?—Yes ; they who have had some extensive experience as practical working men.

19815. I mean you desire to see some men of the class of the actual hewer or drawer, and so on, men actually engaged in working as distinguished from officials appointed ?—Yes.

19816. I suppose that there are duties besides coal mines that they might be employed in. I will take quarries, for instance. Are you acquainted with quarries at all ?—No, I know nothing about quarries.

19817. Now the question of fines has often given one a great deal of difficulty. Supposing one were to enact that a man could always have an appeal if he wished to do so ?—I suppose this fine really cannot be made at present without his consent.

19818. That is the law ; there must be consent ?—Yes.

19819. You think that consent is not enough ? You think that the law is not in a proper state as it stands ?—I do not think, even with the consent of the workmen, that the manager ought to be permitted to fine at all.

19820. On the other hand, particularly in the case of younger miners who are beginning, where you have fellows who do careless things and endanger the lives of other people, at present in order to punish them you would have to take them before the court and make them lose a day's work, and also to a certain extent endanger the mine by taking away the firemen and other persons, who are wanted to give evidence against them. The other is a clear system, and where the boy admits he is in fault, he says, "I know it," and there is an end of it : but it seems to me to be a complicated system to take him away to the magistrate's court. Could you suggest some alternative ?—No, I am afraid I could not. I realise the difficulty of that, but still simply fining him a few shillings would not have the same effect in making him more cautious in the future than if he had to go through that process.

19821. You have another plan. You can suspend him for a day, but that does not seem to be a very good remedy because it only sends him loafing about doing nothing for that day ?—And it is open to very much abuse. I should not recommend that. It may be very convenient for a colliery manager to suspend a workman for a day or more, or for two or three days.

19822. It always appeared to me, without pretending to know nearly as much about it as practical miners, that the suspension in the case of young miners was not a very good thing. It prevented him earning his wages, and sent him about in idleness, and it seemed to me that that is rather a pity ?—I do not think that I can suggest any method.

19823. It is the manager being the judge of his own cause which is the great point that you object to ?—Yes.

(*Mr. F. L. Davis.*) I think the suspension is neither good for the men nor good for the management.

19824. (*Mr. Cunynghame.*) I was rather putting to the witness that point. It sends the men unwilling about on the hills instead of doing their work ?—Yes.

19825. Supposing you had a rule of this kind, firstly, that no fine could be inflicted except for some act which endangered the safety of his fellows at work ; and, secondly, that the whole proceeds of the fine should always go to a fund by which the workmen were in some way benefited, that it should not go to the masters at all. Would that have any effect ?—As far as I know, in cases that have come under my notice, I do not think that the masters have ever appropriated the fines for their own purpose.

Digitized by Google

19826. In France there is an extensive system of fining, but as the money always goes to the men the objection is removed to a large extent on that account. It is not, therefore, like the management being a judge in their own cause. That you would not consider a sufficient answer ? —No.

19827. (*Mr. Enoch Edwards.*) Mr. Richards would not like to suggest that now the employers appropriate part of the fines ?—No, I do not think they do ; in fact, I know they do not in South Wales.

19828. (*Mr. Cunynghame.*) I put the question to elicit the witness's views. There is another point which has puzzled us extremely, and I wish you to throw light upon it : that is the question of the use of safety lamps where inflammable gas has been found. There is difficulty in the interpretation of those words, and they present an immense difficulty, because you must give some notion of a quantity. Is it not true that there is not a mine in the Kingdom where, if you go to find gas you cannot find it at once, in the same way as you can find dust in this room if you look for it ? I suppose you mean a substantial quantity ?—I am afraid that I should come into conflict both with the workmen and the owners. My view of it is this : I think that safety lamps should become pretty general in all our mines. I know that a large number of workmen object, and lots of owners, but personally I should not wait for any large quantity of gas, or anything else. I think, especially in our deep seams, it is best to take every precaution.

19829. On the other hand, I have heard it said that putting in safety lamps in mines that do not need them, although you may get a greater immunity from explosions, causes more loss of life from falls ?—I do not think that is so.

19830. Do you think the men can work as well with a safety lamp as they can with a naked light ?—I must be careful ; I do not say that either, because we generally look for some additional remuneration in South Wales when they change from naked lights to safety lamps.

19831. At all events, that is an argument used on the other side ?—I might say that while it may not increase the danger, it certainly decreases the man's power of earning. A man cannot work as well with a dim light as an open light. That is a matter of common sense.

19832-3. You are of opinion that there are a substantial number of mines in the kingdom worked with naked lights that ought to have safety lamps ?—I cannot say that from my own experience. There have been instances where the inspectors have felt strongly that lamps should be put in, and both owners and workmen have objected. I do not think that is a satisfactory state of things.

19834-5. The inspectors have told us that the great difficulty they find is in interpreting the Act ?—For their own satisfaction.

19836. I think they desire a clearer interpretation of the rule. I think I should be justified in saying that there are not many cases where an inspector seriously thought that safety lamps ought to be in a mine and reported it and did not get them in. You do not put it forward that there are a number of mines that ought to have safety lamps at present which have not got them ?—No.

19837. It is a very important point ?—I cannot say that ; I do not know, really.

19838. Then about the sanitary state of the mines, apart from ankylostomiasis, is it bad ? Is there improvement wanted ?—I do not think it is bad. In this respect very little attention has been given to it, and possibly it would be as well if the under officials had this present to their minds. I do not think that they have ever had this present to their minds.

19839. In all the mines I have been down I have seen pools of water in the road, and it would have made much easier walking if they had been cleaned up better, but I have not come across foul odour, or things of that sort ? —There are occasions sometimes where old working places have been used and perhaps rubbish not taken in as frequently as it might have been.

19840. Where excrement lies about, which, of course, is unhealthy ?—Yes.

19841. Now about timbering, could you give us any help in that respect as to what we could do ? You would suggest the spragging distance, which is to be less than 6 ft., should be laid down by Special Rule ?—I am not referring to spragging ; spragging is laid down.

19842. There are two rules about it, one a General Rule in the Act and the other a Special Rule. That is universal now over England. In the Act it says the distance shall be 6 ft. ?—Not more than 6 ft.

19843. Or such less distance as shall be laid down by the manager ?—I do not know that we can improve very much upon that. The timbering of the roof is the one I had more especially in my mind. There may be some uniform distance for roof timbering.

19844. I suppose we may expect really that the accidents which take place from want of proper spragging at all events will diminish as the men gradually become more careful—as education spreads ?—I do not know that the accidents are very numerous now from want of spragging.

19845. I am afraid they are ?—I think not. They are from falls of roof chiefly. I think the spragging regulation has reduced the number of accidents from falls of coal.

19846. I am very glad to hear so, as I personally have had a lot of trouble with it. As years go on do you agree that there is greater care taken, and an improvement in the care the miner takes of his life compared with 15 years ago ?—Yes, I think that there is considerable improvement.

19847. (*Mr. Ratcliffe Ellis.*) What is your view of the duty of an inspector ; what ought he to do in your view ?—He ought to see that all the provisions of the Coal Mines Regulation Act are observed at the collieries which are under his care. That is his special duty.

19848. That he should see that the provisions of the Act are carried out ?—Yes.

19849. Take a colliery : in order to fully see that he would have to be at the colliery every day, I suppose ?—No—well, of course the actual state of the colliery changes every day.

19850. The Coal Mines Regulation Act has to be observed every day, and therefore if he must fully see that it is carried out he would have always to be on the spot ?—Well, in every detail, yes, that must be so.

19851. That is impossible ?—Yes.

19852. Where would the next step be : how near would you expect him to see that the rules in the Act of Parliament are carried out every day in every mine ?—He could not be every day at the colliery. How often should he be there ?—I do not want to say ; in fact I do not think I will say other than that the times he is there are certainly insufficient.

19853. I want to get your view as to how frequently you consider it necessary that an inspector should visit a colliery to see what I agree with you is his duty, that the provisions of the Act are being carried out ?—I do not want to give any definite special period. All I want to say is that inspection once in 12 months as at present, sometimes once in two years, and then only a superficial examination or inspection of the collieries is certainly very unsatisfactory.

19854. You will not commit yourself to an opinion as to how often you think the inspector ought to be there. Your view is that he is not there often enough ?—No.

19855. Do you think that has been prejudicial to safety ? —Yes, I think so.

19856. Have you anything except an opinion upon that subject ; have you any statistics ?—No.

19857. You have no comparison of the results at a frequently inspected pit and one where there is only inspection once a year ?—I do not know a frequently inspected pit, to start with.

19858. You think more frequent inspection would result in having less accidents ?—It must, I think. When inspections are made it is generally found that the inspector has to call attention to something to be done here, or to something not having been done there.

19859. Do you think that is so, that he always has to find fault after an inspection ?—I do not say always. I said "frequently."

19860. What is your view as to the qualifications for an inspector ?—I do not know that I find any fault with the qualifications of the present inspectors.

19861. You think they are about as satisfactorily qualified as can be ?—I think so.

19862. Do you know any inspector at present who has worked at the face ?—No, I cannot say.

19863. Why do you think that there should be some change made in favour of the men who have worked at the face being inspectors if you are satisfied with the

Digitized by Google

Mr. T. Richards, M.P.

29 May, 1907.

present qualifications?—They would make these more frequent and general inspections.

19864. That is a question of the number. I am speaking for the moment of the qualification. If you are satisfied with the present qualifications, why change them by excluding from the class from which these inspectors are drawn men who have not worked at the face?—We are not excluding them from the chief inspectorship or the assistant inspectorship.

19865. Why exclude them from any?—Because I am afraid our class has been excluded.

19866. That is why you would exclude the others. Is that the way to make for efficiency? Two wrongs do not make a right?—No, of course they do not.

19867. Can you give any other reason, except that workmen have been excluded, why they should be included now to the exclusion of the class which you yourself say is quite satisfactory?—Well, I say that I find no fault with the present qualifications of the inspectors. A practical knowledge of the working of a mine must be an additional qualification.

19868. If the present class of inspectors is good enough—I agree if you can improve it there is no harm in doing that, but if it is good enough you would not wish to exclude that class from any class of inspectorship?—Perhaps not from a purely competitive examination.

19869. Now with reference to the examination, do you think that it would in practice work that everybody who chose should submit himself for examination?—Why not?

19870. There might be a very large number to be examined?—That may be so, but it would very soon become known that there was a standard of efficiency.

19871. You do not like the present system of nomination and think that it might be improved?—I do not like the present system of nomination.

19872. Are you right in thinking that there are a large number of men working as colliers who have certificates?—Yes, absolutely.

19873. Have you any idea of the number of certificates granted each year?—No.

19874. For the five years ending 1905 there were 2,580 certificates granted, that is 945 first class and 1,635 second class. That is at the rate of about 500 a year?—Yes.

19875-8. Roughly speaking, there are about 3,000 collieries most of which have certificated managers. It does not leave a very large number out of 500 each year to be distributed amongst the men who are working as colliers?—500 each year would be a considerable number. There are a large number of men that I know personally who have certificates.

(*Mr. Enoch Edwards.*) That will not be disputed.

19879. (*Mr. Ratcliffe Ellis.*) It is a very good thing if it is so, and I am very glad to hear it?—I have two brothers who had it and they failed to get any appointment. Fortunately they got much more lucrative appointments at the end, but they were working at the collieries and got under-managers' certificates and were obliged to look for other work because they were kept on as colliers.

19880. While I feel that it is somewhat hard that those who have equipped themselves for a managership should not get one, still that is not your object in asking that the under-managers should have certificates, to find positions for anybody?—I was not suggesting the position of managers for these, firemen I was suggesting——

19881. You think that you would have more competent men if selected from this particular class?—Quite.

19882. Do you know how many inspectors there are now?—No, I could not say right off.

19883. I am told there are 38. Have you in your mind the number you would increase that to?—It is a very easy calculation, one to 10,000 men.

19884. That is about 80. With reference to inspection under General Rule 38 you think the reason the men do not avail themselves more frequently of this rule is because there is some sort of fear that consequences might ensue to their detriment if they made an unfavourable report?—I do not want to put that as being very general; I say that may operate in some cases.

19885. I suppose the collier is pretty much the same all over the Kingdom?—I suppose he is.

19886. In some districts this rule is very largely availed of?—Yes.

19887. In the North of England particularly?—I did not know that.

19888. You can take it from me that in some districts it is very considerably used. That feeling does not appear to exist there. Do you really think that has anything to do with it?—It has something to do with it.

19889. Ten years ago I think you said it might have?—It had a considerable amount to do with it ten years ago.

19890. I do not think you will say that it has as much to do with it now. I will not press you about it?—I am not going to say how much, but it has something to do with it.

19891. Then with regard to expense, is not that a deterrent?—Yes, in some cases.

19892. If this rule is to be enforced how would you provide for that to be paid?—I do not know that there is anybody to pay it unless we get the Treasury to do so.

(*Mr. Smillie.*) The Treasury does it in France.

19893. (*Mr. Ratcliffe Ellis.*) You do not suggest that the employer should pay that?—No.

19894. Did you ever hear an objection made to it because it was too hard work?—Yes, I have heard that too.

19895. Can you see how that can be removed?—Increase the number.

19896. It is the workmen?—They may increase their number and take smaller districts.

19897. There is nothing to prevent them doing that now?—The expense would be greater.

19898. It is hard work?—Yes, it is a change of work. It is taking a man out of his ordinary employment and giving him moderately hard work. If it is a different class of work to which he has been accustomed it makes it hard for him.

19899. The object I suggest to you is that the men employed at the colliery should make an inspection of the conditions under which they work themselves and that they can make it more satisfactorily than an outsider?—I thought the object was that the workmen should be allowed to appoint their own inspectors.

19900. You suggest that the workmen employed at the colliery may not like to do it because of being discharged. If they bring two workmen from another pit would they not be at the same disadvantage?—Not under the same owner.

19901. No, but at the colliery at which they worked? Not necessarily. Managers are human like other people, and one manager does not agree with another.

19902. Workmen can be brought from another colliery now who are actual practical mine workers to examine this colliery. Why do you want the examination to be made by a man who is not now a practical worker, but who has been a practical worker?—Because he would be relieved of this——

19903. Is it the checkweigher you mean you desire to make the examination?—I do not think that there could be any great objection to the checkweigher doing it. He would be a free man and would give an impartial report.

19904. You want this rule extended not only that the practical workers should be able to make an examination as to the conditions under which they work, but that somebody else who is not a practical miner but who in some past period of his life may have been a practical miner should make that inspection too?—I should not like to say who during some past period of his life had been.

19905. Is there any halfway house?—I think the workmen would be wise enough in their selection.

19906. You must remember the owner wants some protection. This man would be sent down the pit under no responsibility; mines inspectors are given very carefully guarded instructions and directions, but this man would be absolutely a free lance?—If he knew nothing about mining his report would be of very little value or not do very much damage to the colliery owner.

19907. Is it your view that this would secure an inspection where an inspection might not now be made because the men are afraid if they gave a bad report that it might be to their detriment?—Yes.

19908. During the last 10 years you have never heard of a case in which that has been put forward?—No, I have not.

19909. You have no other ground to suggest than that?—No.

19910. In General Rule 4 you think the examinations now are not satisfactorily made?—I do.

19911. Rather, I gather, because the firemen have too much to do than that they were not competent to make the

Digitized by Google

examination ?—One never likes to call attention to the incompetency of anybody, but there is this fact that they have no test of their competency other than the managers' general opinion of them.

19912. What has a fireman to do in the examination ? He has to see if there is any gas ; see to the condition of the roof and sides ?—Yes.

19913. What very skilled scientific knowledge is necessary for that ?—If he finds gas he has to take steps to get it removed.

19914. He has to fence it off ?—Not only that ; he has to fence it off, and part of his duty is that he has to get it removed. There is a possibility of an unskilled man upsetting the whole ventilating system of the colliery in his attempt to get this bit of gas removed unless he knew his business and the ventilating system upon which he is operating.

19915. Have you ever known a case in which that has actually happened ?—I cannot say that it has come within my own personal observation or experience, but I have known of it, had it told me, that firemen who have gone to remove gas have driven it on to men working in other districts.

19916. You would not put it forward that the present class of firemen, as a class, are incompetent men ?—No, I would not.

19917. Your objection rather is that their duties are too great, that they have to do work which is inconsistent with their making a thorough inspection ?—That is one of my objections, and the other, which is more important, is that the workmen should have more confidence in the firemen than even the manager or the owners, and, I think, in order that the workmen should have confidence in this class of official there should be some test of their competency.

19918. You think he would be more competent if he had to have a certificate ?—If he had to pass an examination.

19919. Now I want to ask you about fines. You have said that you are aware that a man cannot be fined except with his consent ?—I understand so.

19920. You know also that a register of these fines has to be kept under the Truck Act ?—Yes.

19921. And that the inspector has an opportunity of seeing this register ?—Yes.

19922. If the fine is excessive or the requirements of the Truck Act have not been complied with, or there has been a breach of the Truck Act, the inspector can prosecute the owner ?—I suppose that is so.

19923. And that the man who has been fined, if fined an excessive amount, can recover from the person who has fined him, the excess ?—Yes.

19924. Do you think that is a sufficient protection against any injustice ?—I am not complaining so much that there has been an injustice inflicted upon the workmen by these fines. What I say is, I do not think they are a satisfactory method of administering the discipline of a mine.

19925. Have you had any opportunity of comparing the discipline of collieries where fines are inflicted and where fines are not inflicted ?—No.

19926. If it is a desirable way of doing it you have no further precautions to suggest ?—No.

19927. With reference to the rules, you think that a copy should be given to each workman, whether he wants it or not ?—Yes, I think so, when he is employed.

19928. You think if he got that he would read it ?—Undoubtedly, some would do so.

19929. Now about the establishment of special rules : I should like to know exactly what your scheme is for the establishment of special rules ?—I quite see the necessity of some consultation between the owners and workmen and the Home Office for these rules, but I do not think that even the owners and workmen should have the powers in their own hand of agreeing to what is practically an Act of Parliament after all——

19930. Will you tell me your objection to the present system ?—The chief objection that we have had in the past to the present system is that if we failed to agree we had to go to arbitration, and we had no *locus standi* at the arbitration.

19931. If a system could be devised by which you could get a *locus standi* at the arbitration, would that meet with your approval ?—I would prefer their being sanctioned by Parliament. I believe it would be better if the whole thing was subject to discussion in Parliament—it might not be discussed, but subject to discussion, if necessary, before they become operative.

19932. May I suggest to you this scheme for your consideration, that the right to propose a rule should be as it is now, either with the owner or with the Home Office ; that if the owner propose a rule, that this should be advertised and any person interested might have a right to object to it, sending his objection to the Home Office, and then that the arbitration should not be as it is now, each person appointing an arbitrator, but a single arbitrator to be agreed upon, if possible, or, if not, to be appointed by one of the judges of the High Court ?—Agreed upon by whom ?

19933. By the parties interested. I am bringing the men in at the time that the rule is advertised ?—You only bring the men in in the form of objectors to the rule.

19934. Yes ?—I do not think that is sufficient.

19935. Let me put this difficulty to you : suppose an owner proposes a rule, then is he not to be allowed, according to your scheme, to send that on to the Home Office unless the men agree to it ?—He may be allowed to send it on to the Home Office, certainly, but I do not think——

19936. If he can send it on to the Home Office, whether the men agree to it or not, what is the use of discussing it with the men, and if the men are to have a right of veto it would mean no rule could be proposed except what the men accept ?—Under my suggestion Parliament only should have the right to veto.

19937. How is it to get to Parliament ?—The Home Office to propose the rule : then they consult——

19938. Do you think it is a satisfactory way, that we should have no special rules unless they are discussed in the House of Commons and then sanctioned by Parliament ?—I think so.

19939. You think so ?—I do.

19940. Supposing an owner wished to propose a rule you would allow him to do it as he can do it now, by sending it to the inspector ?—Yes.

19941. What is the next step ?—The Home Office would ascertain the views of the workmen upon that.

19942. The Home Office would advertise it and invite objections, and if the men objected they would have an opportunity of stating their objections. Do we agree so far ? What is the next step ? Supposing the Home Office gets certain objections, supposing they objected to it themselves, what is to be done next ?—Then I suppose they would have to be submitted to Parliament.

19943. Argued out in Parliament, we agree up to that point. I suggest, then, if you have no objection from the workmen but the Home Office objected, that it would be a question between the employer and the Home Office, and if we could not agree on a single arbitrator that a Judge of the High Court should appoint one ; if there are objections from the workmen the workmen and the employers would have to agree upon an arbitrator or the High Court would appoint one; and if there were objections from the Home Office and the workmen, the proceeding would be the same. Do you see any objection to an arrangement of that sort away from Parliament altogether and let this arbitrator decide what the rule should be ? Do you see any objection to a scheme of that sort ?—I should like to see the scheme before I say.

19944. Do you think that would be an improvement on the present scheme ?—In any case more provision ought to be made for the workmen to be parties to any special rules than there is at present.

19945. I want you to follow me out. Supposing before an owner can propose a rule he must get the sanction of the workmen—you would not go so far as that ?—No, I do not think I would.

19946. If he is to be at liberty to propose a rule without the sanction of the workmen, the discussion with the workmen would be a mere debating society ?—I do not follow you.

19947. If the workmen have no veto why discuss it with the workmen at all at that stage ?—I am suggesting that the workmen should come in at a later stage before the rule is established. It is proposed by the employer, the Home Office advertises the rule, and the men, if they wish to object to it, can object to it.

19948. (*Mr. Enoch Edwards.*) How can the workmen propose a rule ?

(*The Witness.*) The workman has not the right to propose a rule.

(*Mr. Smillie.*) That is the point.

19949. (*Mr. Ratcliffe Ellis.*) Do you go so far as to say that the workmen should propose the rule ? The obligation

Digitized by Google

Mr. T. Richards, M.P.

29 May, 1907.

of the Act at present is that the owner has to propose these rules. That is what the Act puts upon the owners?—We suggest that the Home Office should propose the rules.

19950. So they can now. Do you wish to withdraw from the owner the right to propose rules?—No, and I do not see any objection to giving the workmen the right to propose a rule, in fact I think it would be desirable.

19951. You think they ought to propose special rules too?—Yes.

19952. Then the employers object if they choose?—Yes.

19953. Instead of the Home Office proposing a rule as it is now you say that the men should be entitled to propose a rule or the owners?—Yes; in practice, although they have not proposed the rule in the first instance, they have had joint conferences.

19954. The Home Secretary has proposed a rule for you?—Yes.

19955. You would wish to have the right given to the workmen to propose a rule. How would you do it? Take the workmen of a colliery. There is only one owner and there is no mistake in finding out who that is. You would have a majority of the workmen, or how would you ascertain whether it was the wish of the workmen that a rule should be proposed?—Of course to get perfect unanimity amongst the workmen would be rather difficult, I agree.

19956. I want to see exactly what your scheme is. If the workmen come to propose a rule who are to be the workmen?—It must be the majority in any case.

19957. If the majority of men in a pit desire to have a rule they should propose a rule?—Yes.

19958. The scheme wants a little thinking out?—Yes, it does.

19959. In haulage roads it would be an advantage if there was a separate travelling road everywhere, but you recognise that that could not be done in every existing colliery?—There would be enormous difficulties in some.

19960. You would not suggest that should apply to all?—There are a great number of collieries where it might be done without a big expense.

19961. And it might be an advantage to do it?—Yes.

19962. If it can be done you think it desirable to do it?—Yes, I do, and in new collieries I would make it compulsory.

19963. That there should be a separate travelling road. You used rather a strong expression, I think, when you said that the workmen had been criminally neglected?—Yes.

19964. Whom do you blame for that?—I blame the owners and the Home Office and Parliament, everybody who has anything to do with this, as well as the miners' agents of course.

19965. Can you point to any occasions when you have taken any means to instruct the men?—Lots of times.

19966. Has it been without avail. Have not you succeeded with all your efforts to make the men careful?—It is not a question of the men being careful. Those remarks apply to the provision of apparatus for rescue work after an explosion.

19967. You think that has not gone on fast enough?—It has not gone on at all.

19968. Do you not think it is very desirable that, in addition to dealing with an explosion when it arises, means should be taken to prevent explosions?—I take that for granted.

19969. What has been done by your Federation in order to encourage carefulness on the part of the men to guard against these dangers which cause explosions?—We have done everything that I think we could do.

19970. And you have not been able to succeed?—I do not think it is so much in the hands of the men as it is in the management.

19971. In what way do you guard against explosions?—By the proper ventilation of the colliery, the prevention of accumulation of gases and accumulations of coal dust. All those are management and not workmen's questions—by the watering of the mine.

19972. You think that so far as the workmen are concerned there can be no responsibility put upon them?—I would not like to say that: among 800,000 there are certain to be some who are not as careful as they should be.

19973. If we had perfect workmen we should have no accidents?—And perfect management too. We should have none at all then.

19974. You would hardly say that it was criminal neglect on the part of the employers?—I am very much inclined to say so. I think if I had a fiery mine employing 1,000 men I should apply myself somewhat to taking all the precautions that could be taken in case an accident took place, and not show the utter absolute neglect there is on that phase of the question at present.

19975. I think you are taking too hard a view. There has been great improvement, has there not, in recent times?—I do not think you follow me. I complain that there is nothing done. I will admit that there has been great improvement with respect to the prevention of explosions. I think the watering has been better attended to, and, speaking generally, I think great interest has been taken as compared with what was taken in former years, but as far as trying to minimise the effects of these explosions when they take place, and to see whether some of the men are alive immediately after the explosion, nothing has been done, absolutely nothing.

19976. With reference to enquiries after a coroner's inquest, do you think that the coroner's inquest does not bring out all the facts, or do you think that it does not punish people?—It does not bring out all the facts, to start with, sometimes.

19977. It is upon that ground that you wish to have a second enquiry?—Yes.

19978–85. Are you satisfied with the constitution of the court, so to speak, where a second enquiry is ordered by the provisions of Section 45? Supposing an enquiry is ordered, are you satisfied with the method of procedure and the powers given to it?—Yes, I think so, on the whole.

(*Mr. Ratcliffe Ellis.*) All that you want is that they should be more frequent, or, as Mr. Cunynghame has put it, be more liberally interpreted?

19986. (*Mr. Enoch Edwards.*) You say that the present number of inspectors in your judgment is not sufficient for the work?—No.

19987. You are perhaps aware that the districts now are mapped out into 12?—Yes.

19988. For the coal mines of Great Britain?—Yes.

19989. Is it your suggestion that there should be more districts?—Yes. I think the Western District, the Monmouthshire District, including Somerset and Devonshire, is a very good area.

19990. You speak of those because they lie nearer your own home?—Yes, and I know the extent of them well.

19991. There is the Midland District, embracing three or four counties, where the chief inspector spends a lot of time in travelling?—Yes.

19992. If there were more districts created there would be less time lost in travelling?—Quite.

19993. This figure is taken from the bill the Miners' Federation provided?—The 1 in 10,000?

19994. Yes.—Yes.

19995. Do you suggest that these additional inspectors should be drawn from the ranks of men who have had practical experience as pitmen?—I do.

19996. Mr. Ellis got you to admit that you have no fault to find with the present inspectors?—He did.

19997. I suppose you have not, either?—Other than as I said to Mr. Ellis, that practical experience must be an additional qualification.

19998. If this type of men were engaged they would be able to pay inspections at the collieries oftener than they do now?—Quite. Perhaps I ought to say I think they would be likelier to do the laborious work of minute inspection.

19999. Inspectors are going round inspecting reports and the plans at the top?—Yes.

20000. You think that is necessary?—I think so.

20001. You refer to the number of men holding first-class certificates, colliers and workmen who have sat for examinations?—Yes.

20002. There are a number holding first and second-class certificates working at the coal face?—Yes.

20003. I understood you rather suggested as a grievance that these men could not be employed as firemen?—I did.

20004. Would they in the majority of cases care to be firemen? Is that the extent of their ambition?—Not

Digitized by Google

perhaps the extent of their ambition, but it must be their ambition to become colliery officials that induces them to study mining and go in for these examinations, and the fireman is the first step up in that direction.

20005. What is the objection to colliery managers not employing these men as firemen: is it that they do not like too many rivals about them?—That is suggested. I might say I do not know that it is very relevant to that question, that Mr. Abraham and I among others were listening to a deputation only yesterday, where, rightly or wrongly, a young man, a collier, who had sat and secured one of these certificates, said that he had had notice to leave the colliery, and he could not attribute it to any other reason but that he thought the manager did not care to have him about because he had this special qualification. That was only the day before yesterday.

20006. (*Mr. F. L. Davis.*) You do not suggest that the colliery manager must appoint everybody as an official in the colliery who has a certificate? He would get many more men with certificates in the colliery than there was room for officials in the colliery. He must pick and choose between them?—What I am astonished at is that numbers of these men are available for this position of fireman, and it is within my own common knowledge that other men are appointed as firemen who have taken absolutely no steps whatever to qualify themselves theoretically. They may be practical working men and are good colliers, and thrifty men.

20007. (*Mr. Enoch Edwards.*) I may take it what you mean is that you do not wish to reflect upon the present firemen?—No.

20008. They are a body of men who understand their work and perform their duties well?—Yes.

20009. The majority of them have been brought up in the pit through its stages, and have been colliers?—The majority of them: I have known of some extraordinary appointments, but they are not general.

20010. In your experience in Wales is there a tendency at all to put a manager with a first-class certificate to control more than one colliery?—It is in operation, but I do not think that it is very general.

20011. There are a number of people who pass the examination who were quoted to you. In many parts of the country is there a growing disposition to put a chief manager with a first-class certificate over a general manager with a second-class certificate at each of the pits in a colliery? What is the practice with you?—That is in practice, but I do not know whether it is growing or not: I could not say. It is adopted in some cases.

20012. In your judgment do you think it desirable that there should be a responsible first-class manager at every pit?—I do, certainly. I do not see how one man can take the responsibility of managing more than one pit.

20013. It is obvious that the area of first-class certificates is being narrowed if you make one first-class certificate do for two or three pits and content yourself with appointing men with second-class certificates at the other pits?—That is so.

20014. With reference to workmen's inspection, I gather the sum total of what you suggest to us is that workmen themselves do not take a very keen interest in this question?—Not as keen as I think they should.

20015. You are not prepared to say what is the special reason why they do not?—Not really.

20016. You think now it would not arise in these days out of any fear that the colliery people would take advantage of a man because he had made an inspection?—In some cases that would operate, no doubt, but I am not prepared to say to what extent. I say at once I do not think that is the general reason.

20017. It would not operate to the extent now it would 20 years ago?—No, nothing like it.

20018. After all, managers are keenly interested in the safety of their pits, and if an inspection by a workman contributes to it, it is to the interest of the Company that it should be done?—Yes.

20019. Now with reference to the question of fines imposed at the colliery for offences, have you had much experience of that in South Wales?—No. As I have said, I knew it was done occasionally, but I understand that there has been evidence given here that it has been done to a considerable extent in South Wales.

20020. In Monmouthshire?—That does not come under my personal knowledge, so that I cannot say.

20021. Not in South Wales, but in Monmouthshire to a very large extent. You say you think after all it is not in your judgment the best thing to fine the men in the colliery offices?—I think not.

20022. A good deal can be said against it?—Quite.

20023. It is suggested unless you enforce some sort of fines, either in Court or in some other way, that you cannot get proper discipline in the colliery. What is your opinion about that?—Is it not possible in well-managed collieries where the discipline is maintained, to carry them on without resorting to these fines?—I think lots of these breaches of discipline occur in consequence of the laxness in their enforcing them regularly. They shut their eyes to little breaches, and, to use an illustration, it is very much like the busmen in London who have printed in front of them "Drive slowly," but they never take any notice of it, and it is only an occasional policeman that enforces it. So it is at the colliery: lots of Special Rules are more honoured in the breach than in the observance, until something happens somewhere, and then it is enforced for a while.

20024. For the moment we are dealing with fines for breaches of rules which affect the safety of the men and the safety of the colliery?—Yes.

20025. Many of these fines so imposed are imposed rather for other matters. It is a question of a man getting his coal clean. It is not a question of the health of the collier?—Quite.

20026. At any rate, whatever may be the view of the workmen on the question, it is suggested to you that some workmen prefer going before the Court. Whatever the workman's view, you think it preferable that he should be taken to the Court rather than fined in the colliery office?—Yes, I do, and I think the offences would become fewer.

20027. There is one rather important matter you have put before us which I should like to ask you about again: that is with reference to the duties of the firemen, or duties other than those of the safety of the pit as imposed on the men. I gather from what you said that very largely the firemen are expected to see to the coal being sent out?—Yes.

20028. You think that interferes with their proper duties in attending to the safety of the pit?—It must do. I am strongly of opinion that his duty should be absolutely confined to the measures of safety necessary for the men.

20029. That is to say, a fireman is supposed to examine working places?—Yes.

20030. He has to go round and examine?—Yes.

20031. And keep his eye generally on the safety of the men, see that the ventilation is proper and going on, and see that at all times the law is being carried out. That should be his work rather than looking after coal coming out?—I would include also, to see that there was a sufficient supply of timber in every working place.

20032. The fireman should be a sentinel to look after these men, and you think that the question of getting coal out should be the duty of somebody else?—Quite.

20033. (*Mr. F. L. Davis.*) On that last point are you not putting it rather high to say that it is the duty of the firemen and the firemen only to look after the getting of the coal out?—I did not say it was his duty only, but he is largely made responsible for the general traffic, and that kind of thing in his district.

20034. What does the overman do?—He occasionally walks round the colliery and spends a large amount of his time at the bottom of the shaft, seeing that things are all right there.

20035. Is it not the duty of the overmen to a very large extent to look after the haulage part of the districts, and see that the coal is coming out?—The fireman is expected to do it.

20036. A part of it, but it is not all on the fireman's shoulders?—Possibly not all of it. There is a master-haulier in some places, and a manager, of course.

20037. There may be some cases in your knowledge where the fireman has a good deal of that work to do, but generally I do not think you would say that that is his chief work. There are other officials, the overmen and others, who have to look after getting the coal out beside the firemen?—Of course there are other officials. That is perfectly true.

20038. Your general statement is that. I am only putting it as I think you state it—correct me if I am wrong—the fireman has more work to do for the size of his district very often than he can properly do?—Yes, and I do not think he ought to have—I press that—anything

Digitized by Google

Mr. T. Richards, M.P.

29 May, 1907

at all to do outside his proper duties as fireman. He ought to have nothing to do with the arrangement of the traffic and looking after the hauliers and the distribution of the trams, or any of that class of work at all. I think he should be confined to looking after the safety of his district.

20039. My experience is that it is the overman who has most to do with the matters you mention, and not the fireman in many places?—It is absolutely impossible for the overman to do it in a big extensive colliery. He can only be in one district at a time, whereas each fireman has his own particular district.

20040. In reply to Mr. Ellis on Rule 38 you said that you were in favour of workmen's inspection being carried out by men who were not necessarily working miners at the time, but who had been in their time and had ceased to be, and you said the checkweigher might be employed for that purpose?—Yes. Mr. Ellis asked me if I should not object to the checkweigher.

20041. Do you think it advisable that the checkweigher should make an inspection; I do not mean to say any one particular man, but generally speaking that a checkweigher should make an inspection?—I do not see any objection to it.

20042. Do you think that it tends to the harmonious working of the colliery that a checkweigher should?—I think so, if he does his work conscientiously.

20043. A good deal depends upon the checkweigher, upon the man, I mean?—Yes: it would depend upon that whoever you appointed.

20044. Do you think that many colliers, whether holding certificates or not, are anxious to become firemen?—I think there are a large number. I believe all these men who have certificates would accept situations as firemen if offered. I know numbers who have made application and their applications have not been entertained.

20045. I think you are quite right in what you said, that in Wales at any rate there are a large number of working colliers who have second-class certificates?—There is no doubt about it.

20046. The manager cannot appoint all these men as officials because they have certificates; there might be too many for the post; therefore he has to pick and choose between them?—Yes. My complaint is that he very often takes the man who has given no study at all to the question; not only has he no certificate, but he has not attempted to qualify for what I regard as the special functions of the fireman. He is chosen because of some other qualification; he is a good workman, and the employers see in him a man able to attend to these other duties I name, and he is appointed because of that.

20047. The manager appoints generally the best man in his opinion for the work. I put it to you you can quite imagine a number of men in a pit, some with certificates and some without, and it is quite possible some without would be better men than those with certificates. It is possible?—The strange part of the thing is that when we come to the higher functions in life we do not generally hear that suggested. For instance, you would not suggest that with an inspector.

20048. A second-class certificate is a very different thing to a first-class certificate, or an inspector's qualification?—In degree. The degree is greater, but the principle is the same.

20049. I asked you just now if you thought a good many colliers were anxious to become firemen. Do you not know from your experience in times like this, with wages fairly high, that the colliers earn higher wages than the firemen?—Some of them would.

20050. I know that is the case from my own experience?—I admit that. I think some colliers would be earning more now.

20051. I say in good times; I do not say all through?—Taken generally I think the firemen's wages would be higher than the colliers', taking a period of years.

20052. You do not suggest, do you, that the fireman neglects his work, that is the ventilation and the finding of gas, and his important work, for work such as seeing that the coal comes out properly?—I am afraid he is compelled to sometimes.

20053. Because he has too much work to do?—Because he has so much work to do, he really cannot give attention to it all.

20054. It is not conceivable that a manager would allow that state of things to go on if the man had in his opinion too much work to do. It is to the interest of the manager that the fireman should do his work properly. He is responsible?—Yes, it is to the interest of the manager.

20055. With regard to the Special Rules, you say a good many men do not read the rules?—I suppose that must be so.

20056. Does your Federation or you, as miners' agents, do anything in the way of impressing upon the men the necessity of carrying out the Special Rules?—We do, often; I mean it often happens, if we have sometimes to call attention to the want of inspection—it generally begins by our calling attention to the want of greater inspection, and when we do that we always urge upon the men that they should properly observe the rules.

20057. I see you have done it, but I did not know that it was generally done?—I think you may take it that we have a sincere desire that the men should observe all the rules, and if we do not do as much as we might, we shall be prepared to improve.

20058. After all, the object of the Special Rules is really to make for the safety of the working, and the safety of the men, and the protection of the property?—Quite so.

20059. If the men were to carry out these Rules more carefully there would not be the same necessity for extra inspection, would there?—I think if you say both men and the management, I am prepared to agree with you. I think in the matter of timbering, for instance, the only remedy the workman has at present, if he has not sufficient timbering to keep himself safe, is he is told he must withdraw from his working place. That, to a man earning small wages and having a family to support, is a great temptation to break a rule and continue working until the timber comes. I have known that to take place, and I think you will find that it is a very common occurrence; rather than the men withdraw and loose their wages they will take a bit of risk until timber comes.

20060. With regard to the timbering rules and the spragging, I think you said, in reply to Mr. Ellis, that you agreed that within the maximum the manager was to decide where they were to be placed, what distances apart?—The spragging rules are set by the Special Rules.

20061. Yes?—In the principal Act, really.

20062. (*Mr. Ratcliffe Ellis.*) In the General Rules?—Yes.

20063. (*Mr. F. L. Davis.*) Owing to the great difference of conditions in the different places, it is not possible to do anything else but leave it to the discretion of the manager within limits. That was your answer, I think?—No. It is a very difficult problem, I will admit: as far as our seams are concerned there is what is known as systematic timbering, but, I think, it might be attempted more generally than it is at present.

20064. You made a difference between the timbering and the spragging?—Yes. With regard to the spragging I do not say that you can have a lesser distance than six feet. It would seriously interfere with a man getting his coal at all if you reduce that distance.

20065. With regard to the general timbering, you thought something more might be done with benefit by some discussion between the management and the men?—Yes.

20066. I think you said you did not think it would be possible, at any rate in a very large number of cases, to make travelling roads compulsory except in new collieries?—I said there were some places where it would be very difficult: there are other places where, I think, it might be done even in old collieries, with very little trouble.

20067. You made rather a sweeping statement with regard to the breaking of shackles and the examination of shackles. Have you had any experience—it is only lately it could have been—with regard to how far electric hauling has been an improvement in that respect?—No, I am afraid I have not: in fact, I have not seen the electric hauling underground at all.

20068. There has not been very much of it up till the last few months, but, I think, you may take it from me that there is a great improvement. The haulage being steady instead of jerky, as it is by compressed air sometimes, or by steam, it is a steady pull, and the chance of breakage of shackles is much less than it has been before. I think that will be found to be so as electric haulage is used more generally?—Still, the precaution of periodical examination of the shackles is not an expensive matter, and it may reduce some of these accidents—a number of them.

Digitized by Google

20069. You suggested, to get over the difficulty of the dust to some extent, that the trams should not be filled so full ?—Yes, should not be filled above the level of the tram, whatever height tram you want.

20070. That would mean either that with the existing trams you would have practically only half a load, or you would have to get new trams, standing much higher in order, to get out the same quantity of coal ?—They might alter their present trams without disbanding them altogether.

20071. You would agree with me that sending out half-filled trams would be very expensive ?—I do not suggest that at all: I suggest you should have a tram sufficiently high for the height of your roadway, the height you are accustomed to pile your coal up to now, and that the tram would be filled to the level instead of being piled up above the tram.

20072. With the existing pits, in many of the valleys throughout South Wales, do you think it would be possible to have the screens any considerable distance from the pits ?—No, I am afraid, in some of our narrow valleys, it would be a bit difficult.

20073. It is the formation of the country that makes it difficult for us ?—Yes.

20074. It is easy in a flat country to lay out your surface arrangements in a very different way from what you have to do in our narrow valleys. Do you agree with that ?—Yes: in some cases it would be difficult.

20075. You said you thought that the same type of safety lamp should be used. Is it the same lamp, or the same type of lamp, that should be used generally ?—I think that there should be a provision that all lamps should be up to a standard. I hope this Commission will, as the result of their enquiries, set up a standard that every lamp must comply with—I do not say the same type of lamp, but that there should certainly be standard provisions, and that no lamp, unless it can come up to some test, should be permitted.

20076. That is what I mean by "type" ?—Only those should be allowed.

20077. Then you said that one standard or class of oil should be used ?—I have understood that it is possible for inferior oils to be used, and not only give the workmen a very poor light, but fill up the gauze of the lamp and make it useless as a safety lamp.

20078. There is no doubt, on the owners' side of the table, that anything they could do to make lamps safer would be an advantage to them, in the long run, but, I think, we have had evidence before us already, or opinions given by the inspectors, with regard to a standard of safety lamp ?—Of course, I do not pretend to be an expert either as to the lamp or the oil, but what has impressed me is, as I have already said to this Commission, that a Commission sat 20 years ago, and they, even then, felt that there was a necessity of some unification of the kind of lamp to be used and the necessity of further research with respect to these lamps, and, as I understand, very little has been done from that day to this. I mean, only so far as private individuals have tried for speculative purposes to put a lamp on the market. There has been no central authority, as was suggested by this Commission, to see what could be done.

20079. With regard to the second enquiry, in addition to the coroner's inquest, what sort of Court would you suggest for the enquiry: how would it be composed ?—I am not prepared to suggest any kind of Court.

20080. (*Mr. Ratcliffe Ellis.*) I think the witness thought the provision in the Act was sufficient ?—I did say so, for the time being.

20081. (*Mr. F. L. Davis.*) You thought that it was not sufficiently acted upon by the Home Office ?—By the Home Office.

20082. (*Mr. Smillie.*) Mr. Ellis put it to you, very pointedly, as to what your interpretation of inspection of mines really was. I do not think you answered very clearly. Section 41 of the Act deals with the powers of inspectors and Paragraph (ii) says, "to enter, inspect and examine every mine" ?—Yes.

20083. Do you think that it is an inspection or examination of a mine for a mines inspector to go down the pit and go into one particular section or part of the mine and come out again ? Do you call that an inspection ?—No; I think I certainly made that clear, because I regarded it as a man sampling a piece of cloth.

20084. Do you think that the inspection of 10 per cent. of the mines of this country, as at present carried out by the inspectors, is a complete inspection ?—No.

20085. You do not think 10 per cent. of the mines of Great Britain are completely inspected once in every 12 months ?—No, I think not.

20086. What you really mean by "inspection" would be a complete examination of the mines, going from place to place and section to section, until the Inspector had seen the whole mine ?—Any other inspection to me is useless in a coalmine.

20087. That is what you would call a thorough inspection of the mine ?—Yes.

20088. As a practical workman and Miner's Agent, you feel that is not done at the present time ?—No, it is not.

20089. Is it not a physical impossibility for the present class of inspectors to carry out inspection once in 12 months of all the mines in Great Britain ?—Oh, absolutely; they could not do it once in two years.

20090. In your opinion the mining community will not be satisfied that their safety is being properly looked after, so far as the inspector is concerned, until a thorough examination of the mine is made periodically ?—That is my opinion.

20091. Do you think once a month would be too much for a mine to be examined, especially a mine where there is supposed to be any danger from accumulation of gases, or any other cause—serious danger from any cause ?—I do not think it would.

20092. You think as far as possible that inspection should be surprise visits ?—Yes.

(*Mr. Ratcliffe Ellis.*) Will you ask the witness if he thinks with 80 inspectors that could be done ?

(*Mr. Smillie.*) Do you think even with 80 inspectors for the whole of Great Britain that there could be a thorough examination of all the mines once in 12 months ?

20093. (*Mr. Ratcliffe Ellis.*) Once in a month ?—Once in a month, I hardly think it could.

20094. (*Mr. Smillie.*) It would take 800 ?—It would take a great number. Of course there are some of the mines where this inspection may not be required to the extent that it is at others.

20095. I was going to put that to you. You yourself know some mines where you do not think inspection every month or once in twelve months would be required because of the careful management ?—Yes, and the nature of the mine itself.

20096. Yes, in other cases because of the nature of the mines, and perhaps because of the management to some extent. There should be regular inspection until the management was improved ?—Yes.

20097. Such a case was the mine in which there was that explosion mentioned this morning ?—Genwen.

20098. If proper inspection had taken place, and proper precautions had been taken in all probability that explosion would not have taken place ?—I think so.

20099. That is your opinion ?—In fact, one of the defences in the action where these fines were inflicted, £5 in four instances, was that the inspector had been there several times.

20100. And he did not find any fault ?—He did not find any fault.

20101. With what was clearly a breach of the Mines Regulation Act ?—Yes, due to the perfunctory manner in which the inspection was made.

20102. Mr. Ellis put it to you, do you think mines inspection has done any good; does it make mining more safe than it would be ?—Certainly.

20103. Have you known of cases in which special preparation was made for the inspector, extra timbering prepared and brattice taken in, if it were known that the inspector was coming ?—Scores of times in my own personal knowledge.

20104. You do not think that would have been done had it not been known the inspector was coming ?—No.

20105. So that from that you take it additional inspection would lead to additional safety ?—Quite.

20106. Rule 38 is a point upon which I understand the miners are very strong. You see no reason why the inspection under this should be confined to persons who are at the moment working as miners ?—No, I do not.

20107. Do you think that was the intention of the framers of this clause ?—No, I do not think it was.

Digitized by Google

Mr. T. Richards, M.P.

29 May, 1907.

20108. If that prohibition were removed it would be possible for the miners, if they cared to do so, to appoint two thoroughly practical miners in any district and allow these men to continually inspect one pit after another?—It would be possible if that were removed.

20109. It is impossible under the present interpretation of that clause that such a thing could be done?—Yes.

20110. Supposing they were practical working miners at the time of their appointment, after they make an inspection of a mine they would then cease to become practical working miners unless they returned to their work again?—Yes, and could not be appointed at another colliery.

20111. Do you remember the time the miners had no right to appoint check-weighmen unless men engaged at the mine in which they were about to be appointed?—Yes, very well.

20112. The miners requested Parliament to alter that?—Yes.

20113. On the ground that they wanted a wider selection?—Yes.

20114. The Government ultimately gave them the right to appoint any person to become a check-weigher?—Yes.

20115. You think that would be a considerable improvement if that were done in this case?—I do.

20116. Could you give us approximately the extent of the firemen's district in your larger collieries, or the number of men under their charge?—I only want it approximately, say 40 or 50 or 100 men?—It is very much more than that. I think that I can safely say that the number of working places would be anywhere from 50 to 100, and even higher than that.

20117. From 50 to 100 working places and your system is longwall?—Yes. I may say a man passed me a note at our Council meeting where we had representatives of the whole of the South Wales Coalfield yesterday, and this is the note that one of the representatives, Mr. John Thomas, of Garw, whom Mr. Davis knows very well, a Miners' Agent, a very reliable man, and he says from 85 to 90 places producing 500 tons per day a fireman would have to inspect.

20118. The general system in South Wales is the longwall system?—Generally, yes.

20119. A fireman under the Rule by which he is appointed is supposed to examine the working places, all the travelling roads and haulage roads and all side roads in which men may pass to and from their work?—Yes.

20120. That is supposed to be his examination in the morning?—Yes.

20121. Would you say as a practical miner that it is physically possible for a fireman from the time he starts in the morning until he returns to the pit bottom or station to carry through that examination if he goes in and out all the roads?—It is possible for him to walk the roads, but I say it is absolutely impossible for him to make a careful examination. He cannot do it.

20122. Have you much ripping in your longwall workings?—Yes.

20123. A ripping of each roadway?—Yes.

20124. It would be necessary that a careful examination should be made of each road-head for explosive gas in addition to examination in the face?—Yes.

20125. Is it not your opinion that it is impossible to make that examination if all the roadways are examined?—I do not think it can be done in the time.

20126. Do you think that those examinations are made in the thorough manner expected?—No, I have just said they cannot be done, so that it goes without saying they are not done.

20127. Is it customary (unless you are sure do not answer) for firemen to find that they have not time, but go straight along the face and do not go out of the road and in and out again?—I am told that is so.

20128. You do not know that of your own knowledge?—Of course in the examination before the shift there are generally not many workmen there to see, but as to the examination during the shift, I am told that is the general practice: firemen never think of going out of the roadways.

20129. He is only supposed to put the day of the month and the chalk mark on the face. There is no method of finding out whether he has examined other roadways or not?—No.

20130. The firemen are a very careful and reliable lot of men as a whole. Do you think that any large number of them have any theoretical knowledge of gases?—I think that there are a very large number who have not that theoretical knowledge.

20131. Their knowledge is practical generally?—I ought to say this perhaps——

(*Mr. Ratcliffe Ellis.*) Those are the sort of men you recommend for inspectors, men with practical knowledge.

(*Mr. Smillie.*) Who have also a certificate.

(*Mr. Ratcliffe Ellis.*) You want both?

(*The Witness.*) We give preference to the men with certificates.

20132. (*Mr. Smillie.*) We do not propose that anybody should become an inspector in this third grade who does not hold a first-class certificate of competency, and if he holds a certificate of that kind he ought to possess the knowledge. The firemen, good as they are to-day, would be better if they had the theoretical knowledge which would enable them to hold a certificate?—Yes.

20133. We may take that for granted?—I think it goes without saying.

20134. Is it your opinion that the fireman is the most important man who goes down a colliery so far as safety is concerned?—Yes.

20135. Even to a greater extent than the manager the lives of the workmen are in the hands of the fireman?—If the fireman is neglectful then the manager is hopeless.

20136. A most important question this Commission has to deal with is timbering, and you dismiss it in your evidence with a very few words. The question has not been put as to whether you think that timbering should be done by men specially appointed by the employer and paid by him, or that men should be appointed and paid by the employer whose special duty it would be to see that the workmen timbered their places properly. I think you have not answered that?—I have not, and I find very considerable difficulty in answering it as far as our practice is concerned.

20137. So far as your practice in Wales is concerned?—Yes. If we were assured that really practical men would be appointed even to do this work and a sufficient number of them to ensure that when a post was required the men would be there to put it up, then I should say yes, but our men are being paid by results on the amount of coal they get, and the temptation there would be, if there is a special man to put up the post and a post is wanted and the man is not there to put it up, for the collier to get more coal till the man comes, rather than put up the post himself: so that I see exceedingly great difficulties.

20138. Do you think accidents in mines in this country would be reduced considerably if all the coal getters were paid day wages rather than being employed by piecework?—Certainly.

20139. The piecework system makes them run risks they would not otherwise run?—It must do.

20140. You have your mind made up as to whether you would alter our present system of timbering. You think there should be systematic timbering?—Yes.

20141. A very large number of accidents arise from haulage. I suppose the drawbars of the trams would require the same examination as the shackles?—Yes.

20142. They are in the same position, and very often a drawbar breaks?—That is so.

20143. Your system of haulage in Wales lends itself to considerable trains of trams going together?—Yes, very long trains sometimes.

20144. Sometimes on dooks and at other times on heads or headings?—20 and 25 trams.

20145. Would you approve of a chain or some other method passed over the whole train of tubs and joined, so that in the event of a shackle or drawbar breaking there could be no run-away?—Anything that would prevent a run-away.

20146. Is there any system at present in which a chain is taken over the top of the tubs, or which chains the tubs to prevent them breaking away, in Wales?—There may be.

20147. If you are told that system is in force at many collieries do you think that it would tend to greater safety?—I think so.

20148. If that were done, if a shackle or drawbar broke, the tubs could not run away?—No.

Digitized by Google

20149. You are favourable to sufficient room being left on the side of a haulage road to enable men to walk along there. You do not apply the same to a horse road?—Of course it is desirable everywhere, whether it is haulage by machinery or by horses. The degree of danger is not the same in a horse road.

20150. Are there many accidents arising in the country generally on horse roads?—Yes, I am afraid there are.

20151. Where should a driver be in driving a horse with a trailer and 2, 4, 6 or 10 tubs? Where is the most suitable place for him to drive—between the horse and the tubs?—No, I think he should be in front of the horse.

20152. Has he any spragging to do coming down hill in any part?—Yes, he has some.

20153. Is it possible to sprag in front of the horse?—No, unless he stops him.

20154. He would require room at the side of the road to do spragging?—I am afraid that sometimes has been responsible for accidents, that there has not been sufficient space where spragging has to be done.

20155. It would be a great deal safer if there were room on the side of all roads where it is possible to have more room?—Yes.

20156. Your coalfields in Wales have developed rapidly during the past 25 to 30 years?—Very.

20157. Would you say that there is a very considerable proportion of workmen working underground and at the face in South Wales who have gone into the mines after they reached manhood?—Yes, a big number I should say.

20158. What we call unskilled workmen?—Yes.

20159. Do any go to work at the coal face immediately they start work?—Yes.

20160. Do you know whether or not the rule on the point is carried out that they must have two years' practical experience with an experienced miner before having a place of their own?—I have heard it suggested that that rule is being met by putting two unskilled men together.

20161. That was not the intention of the rule?—No.

20162. The intention of the rule was that persons should serve an apprenticeship of some kind to make sure that they were qualified to take a place for their own safety?—Yes.

(*Mr. Ratcliffe Ellis.*) That cannot be the construction of the rule.

20163-4. (*Mr. Smillie.*) Have you any miner employed in your mines in Wales who does not understand the English or the Welsh language?—No, I do not think so. I think we had a few Italians upon one occasion, but I think they are all gone.

20165-6. Do you think it would tend to safety or discipline in your Welsh mines if the workmen did not understand the English or the Welsh language?—All the powers we have would be brought about to prevent any workmen being employed in the mine who did not understand the English or the Welsh language. It must be a source of danger.

20167. You would be strongly opposed as an experienced miner to the employment of unskilled miners, especially those that did not understand the language?—Very strongly opposed. I cannot conceive anybody arguing that they would not be a source of danger, especially after the questions that have been put to me with regard to workmen observing the rules by this Commission even.

20168. Every miner working at the coal face is expected to ascertain from the fireman every morning as to whether or not his place is safe?—Yes.

20169. If he did not understand the language, and the fireman was not instructed in his language, he could not let him know whether it was safe or not?—Quite.

20170. You are in favour of the ambulance stretchers being closer to the working face if possible?—Yes.

20171. Some of the working places are fully two miles from the top?—Yes.

20172. Would you also be in favour of ambulance wagons being near the surface in order that workmen might be conveyed home quickly?—Yes.

20173. Have you any provisions of that kind in Wales at the present time?—Yes, a large number of workmen supply them themselves. There are lots of instances where from the fund they have for paying their doctors they also provide these ambulances.

20174. Where they are not provided, the old method of a cart or something else is used?—They are carried on stretchers.

20175. They are carried on the stretchers home?—Yes.

20176. Section 16, Sub-section (*b*) provides that shafts which are sunk after the passing of this Act should not be closer than 15 yards apart. From the experience which you have gained since the passing of this Act, do you think 15 yards is sufficient? Are they not too close together in the event of an explosion, or a fire taking place?—There would be better opportunity of preventing the explosion going from one to the other if they were farther apart.

20177. Would it be desirable in new mines that are being sunk that they should be farther apart than 15 yards?—I think so, and it must add something to the safety, and I do not see any reason why the cost should be any greater with a little difference in driving the connection.

20178. Would you be in favour of separating the down-cast and the up-cast pit-heads, so that in the event of a fire taking place at one it might not communicate to the other? Is there any danger with the down-cast and up-cast shafts connected by the same pit-head, in the event of fire in either the down-cast or the up-cast shaft, that it would be communicated from one to the other?—I think it would be desirable to separate them.

20179. If possible there should be a division between the two pit-heads?—Yes.

20180. You say the sanitary conditions in your South Wales coal mines, so far as excrement and filth are concerned, are not bad at this time?—No.

20181. Would you be in favour of baths being supplied so that workmen might wash themselves and change their clothing at the pit-head before going home?—I have often thought that desirable.

20182. Is it the case in many collieries in wet workings that the men come up in wet weather with their clothes wet through and have to go home in that clothing?—In a large number of instances they have to ride in the train.

20183. Do you think it would be a good thing if baths were supplied and drying stoves, which would enable the men to change their clothing?—It must be, I should think.

20184. Do you think that the mining industry in this country gets sufficient attention at the present time from the Home Secretary. Do you think it possible for the Home Secretary with all his duties to give proper attention to such an important industry as mining?—No, I think the industry is of sufficient importance to have a department to itself.

20185. Do you favour a mining department with a minister of mines whose duty it would be to look after the mining industry as a whole?—I do.

20186. You think it might tend to greater attention and greater safety in the mines?—Yes.

20187. There is one question I want to ask you, but I do not know whether I may. It is with regard to check-weighing. I understand the Welsh owners in every case erect comfortable shelters for check-weighers at the pit bank?—They do.

20188. You have no real trouble?—No trouble whatever.

20189. Have you acted as a check-weigher yourself?—No.

20190. You have had considerable experience in visiting at the pit banks?—Yes.

20191. Do you think it possible for a check-weighman to do his duty thoroughly where he is not properly protected from the weather and from dust and rain?—No, I do not think he could.

20192. Have you known of cases in which the check-weigher has called the attention either of the mines inspector, or your own District Committee, or yourself in cases of danger existing underground, want of proper ventilation and timbering. Have there been cases in which check-weighers have had to complain either directly to the union officials or the mines inspector?

(*Mr. Ratcliffe Ellis.*) Union officials would have nothing to do with it. He would have no right to make such a complaint to the manager of the mine. It would be going outside his duty altogether.

(*The Witness.*) As a deputy of the workmen I know of lots of instances where he has done so.

(*Chairman.*) He has done so whether entitled to or not.

20193. (*Mr. Smillie.*) I do not say to the manager nor to the management. My question was, have there been any cases in which the check-weighman has complained to the mines inspector or to the Union officials?—To the Union officials, yes. I do not know of a case where he has complained to the mines inspector.

Digitized by Google

Mr. T. Richards, M.P.

29 May, 1907.

20194. The Union officials have taken action either by calling the attention of the management in the first place to it, or ultimately calling the attention of the mines inspector ?—Yes.

20195. In his position at the pit bank he knows sooner than anybody else from the workmen the condition of matters underground ?—Yes.

20196. It is recognised that the duty of the check-weigher, for which he is appointed, is to look after the weighing of the material and the correct marking of the material of each workman ?—Yes.

20197. He is generally looked upon by the miners to some extent as their representative ?—Yes.

20198. He often takes part in their meetings, and he hears complaints as to dangers and other things, and conveys them to the officials. Have you heard of any objection to the check-weighman taking part in those matters ?—We have several instances where we think the check-weighman has been removed for performing what he certainly ought to have a right of doing.

20199. Do you think the checkweigher should not have the right of citizenship away from the mines the same as anybody else ?—That is the great complaint we have.

20200. (*Mr. Wm. Abraham.*) With regard to the overman and the traffic, the overman would look at the traffic more particularly for the whole mine ?—Yes.

20201. The fireman would be attending to it in his own district ?—Yes.

20202. Both are necessary ?—Quite.

20203. So that the overman could not do what the fireman is expected to do in many cases ?—No, I do not think he could.

20204. With regard to this new class of inspectors that you are of opinion we should get, there the chief qualification would be, in addition to a man having a certificate, that he had been a practical collier himself, a practical repairer and knew the work thoroughly ?—Yes, that is my idea of it.

20205. That is the class of man in your opinion who would be able to ferret out, as it were, dangers lurking in various instances, where the present class of inspectors would not go and look for them ?—Yes.

20206. With regard to the present class of inspectors, in your opinion have they too much work to prevent any dangerous practice that they see ?—No, I do not think they have.

20207. Would it not tend very materially to reduce dangers if they could order and not simply advise ?—Yes, I think so.

20208. With regard to the firemen, you are of opinion if the districts that these firemen have to examine and, attend to were materially reduced, that would tend to the safety of life and of the mine ?—Yes, I think so.

20209. Do you know instances where firemen have been working 8-hour shifts ?—Yes, and they say (I have no statistics with regard to that) as the result the accidents are fewer than they were before. I know of some collieries where the owners themselves have put their firemen upon an 8-hour shift, three shifts of firemen, and we have testimony from those firemen themselves—I have no statistics with regard to that unfortunately, but they say the accidents are very much fewer since they have had the reduced hours as firemen.

20210. With regard to the present system of coroners' inquests, in your opinion that is not satisfactory ?—Yes.

20211. Did I understand you to say that the Mines Act, Section 45, would be sufficient if it is carried out ?—For the present I should say yes. I should say if that enquiry were held in all serious accidents—that is what I mean.

20212. You base that upon the qualifications of the persons who carry out that enquiry ?—Yes.

20213. Supposing that further enquiry had been carried out in cases that you know of, in your opinion would the decision have been different ?—I think so.

20214–5. Where a manager has been fined to the full extent of the Act under the ordinary system he is still at liberty to go on and manage that colliery, as he is doing in the last case that was mentioned at another colliery at the present moment ?—I think that the Court should have suspended his certificate.

(*Mr. Ratcliffe Ellis.*) It had no power.

20216. I understood you to say that you were satisfied with the provisions. Do you think that the Court should have power to suspend a certificate, or that that should be left to the Home Office ?—I have not thought of that, but what I have thought of is that the Home Office would attach very much more importance to the enquiry of this Court than the ordinary coroner's court.

THIRTY-FIRST DAY.

Thursday, 30th May, 1907.

PRESENT :

Lord MONKSWELL (*Chairman*).

Sir LINDSAY WOOD, Bart.

THOMAS RATCLIFFE ELLIS, Esq.
JOHN SCOTT HALDANE, Esq., F.R.S.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

JOHN GEORGE HANCOCK, called and examined.

STATEMENT OF WITNESS.

Mr. J. G. Hancock.

30 May, 1907.

20216A. (1.) *Inspection.*—No complaint whatever can be made concerning the manner in which the inspectors of the Midland district do their work. I think, however, that every colliery should be visited more than once every year by an inspector. The inspection should be thorough, every part of the mine being visited and examined. I should like an inspector for every 10,000 persons employed, and think there certainly ought to be one for every 15,000 or 20,000 employed.

(2.) I am of opinion that the size of districts should be reduced, as time now spent in travelling without adequate recompense would then be spent in inspecting.

(3.) I cannot admit that inspecting a certain area, and accepting that as a criterion of the whole of the colliery is satisfactory, reliable or safe.

Digitized by Google

(4.) *General Rule* 38.—I do not know of more than one or two cases in Notts where workmen have inspected the mine. I do not think that it is in any case a question of expense so far as workers are concerned. I do not think that owners have contributed to the expense in any case.

(5.) Men think their examination tends to relieve managers of a responsibility they ought not to be relieved of, and places on men a responsibility they ought not to have. An unfavourable report might be detrimental to the examiner as a worker and subject him to the harsh treatment of his employer. An unfavourable report might also be detrimental to him as a co-worker.

(6.) Such examinations must in every case be to some extent superficial and incomplete because these men do not understand and cannot measure ventilation, cannot read plans, indeed, have little or no opportunity for seeing them, so their report could not be worth much, and, when they had done their best, might be misleading and productive of discomfort to themselves. Should an accident occur after one of these inspections this report may be produced on the owners' behalf, although, owing to its practical character and the inspectors' utter lack of theoretical knowledge or technical training, it may really be of little value in that connection, and in that way an interpretation or meaning may be placed upon it that is not honest to it or the inspectors. The condition of the mine at the time of the accident may be very different to that at the time of the inspection.

(7.) Mines are managed much better now than they were, consequently, there is not the necessity now for these inspections that there was. There is not, and never was, so far as my experience goes, any great desire, on the men's part, to make these inspections.

(8.) *General Rule* 4.—I am convinced that deputies do not examine the gates, but on entering the face by the first gate travel along the faces returning by another gate, leaving the intermediate gates unexamined. Shotfirers are expected, in these cases, to examine the intermediate gates, but they act very much on the same principle; consequently, these places are not systematically examined. I am convinced that deputies should be men of practical experience, *i.e.*, men who have worked in the mine.

(9.) *Discipline, Fines and Prosecutions.*—Generally speaking the men are opposed to any recognition of a system of fines, but in a few cases have agreed with the employers upon a system. I think that some offences can be met by a fine; others cannot, and prosecutions are then necessary

(10.) *Establishing Special Rules.*—I think that working men could, with advantage, be asked for their opinion when Special Rules are being prepared.

(11.) I am in favour of some of the Special Rules being put into the General Rules, especially those relating to machinery, shafts, managers, under-managers, deputies, and, perhaps, lamps and explosives.

(12.) *Haulage.*—I should like to have separate travelling roads wherever possible. I think, that on one side, at least, and the whole distance, there should be plenty of room to walk. It is a great advantage to have the refuge holes whitewashed on the edge and inside. Roads should be as straight as possible; dip should be as regular as possible, hills and swamps being avoided.

(13.) I think that drags should be compulsory. Overchains should be used to check or stop any runaway trams, and competent persons, not inexperienced boys, should be employed. Each person should know his own work, and be responsible for it, so that there may be no unnecessary division of responsibility. The engineman, especially, should not have any other duty.

(14.) *Other Classes of Accidents.*—Mine officials should be the only persons allowed to carry explosives, they should fire all shots, recover unused or misfire explosives, and account for all that they receive. Shot-firing should be done between shifts, especially in deep, fiery and dry and dusty mines.

(15.) Winding enginemen might be compelled to obtain certificates of competency.

(16.) Detaching hooks and safety catches should be provided with a view to saving life in cases of overwinding or rope breaking; appliances for shutting off steam, applying brake, and stopping the engine at a certain point in case the engineman fails to do so, should be provided.

(17.) Wastes should be filled so far as dirt will do this, and no dirt brought to bank unnecessarily.

(18.) Iron trams are safer than wooden ones especially in fiery mines.

(19.) The employment of unskilled labour is dangerous and should be discouraged.

(20.) Ambulance proficiency should be encouraged on the part of officials and workers.

(21.) *Investigating Mine Accidents.*—Coroners in our district are all that could be desired. I think that relatives of deceased should have ample and clear notice of post-mortem examinations so that they can be medically represented. In the event of either party desiring an enquiry, as per Section 45, the Secretary of State should at once direct such investigation to be made.

(22.) *Safety Lamps.*—Safety lamps are inconvenient, and injurious, consequently the use of them should not be unnecessarily extended; they should be securely locked, in every case, and should be thoroughly tested.

20217. (*Chairman.*) You come before us, I understand, to give evidence on behalf of the Nottinghamshire Miners' Association?—Yes.

20218. What official position do you occupy in that Association?—I am the agent and financial secretary.

20219. How long have you been in that position?—I have been agent and financial secretary since 1896. I was assistant secretary from 1892 down to then.

20220. You say in paragraph 1 that you make no complaint concerning the manner in which the inspectors of the Midland District do their work, but you think that every colliery should be visited more than once every year by an inspector, and that inspection should be thorough, every part of the mine being visited and examined. How often do you suggest that an inspector ought to go down the mine?—I think he should go down at least twice in the year.

20221. Twice in the year would be the amount of inspection you consider desirable, that twice in every year he should go through every part of every mine in his district?—I think so.

20222. Go right through it?—Yes.

20223. How many inspectors do you suppose that would require?—I could not say I am sure.

20224. A very great many more than there are at present?—Yes.

20225. Now every inspector with very few exceptions goes down some part of every mine in his district once in the year. That is what they do at present?—I am not sure of that.

20226. I think statistics show that is so. Almost every mine at all events is inspected once?—Yes, almost.

20227. Sometimes an inspector thinks a mine is in such a satisfactory condition that it is not necessary to inspect it, but as a rule he would go down every mine once a year?—Yes.

20228. But he will not go all over it?—No.

20229. I believe in the course of these inspections, as a rule, they only go over a small portion of a mine?—I believe that is so.

20230. Therefore you would suggest that there ought to be at least double the number of inspectors to do what you desire?—Yes.

20231. That is to say, they should go down every mine twice as often on an average as they do at present, and that all these inspections should occupy a great deal more time?—Yes.

20232-3. That would mean more than twice the number of inspectors. Inspection once every six months would mean twice the number of inspectors; therefore your proposal would mean three or four times the number, I presume?—I presume it would.

20234. (*Chairman.*) There are now about 40 inspectors and assistant inspectors, and you would suggest that there ought to be something like 200?—Yes, I think it would mean that.

20235. You say that you should like an inspector for every 10,000 persons employed. There being about 800,000 persons employed, that would mean 80 inspectors. You say you think there certainly ought to be one for every 15,000 or 20,000 persons employed. There is one for every 20,000 persons employed now?—Not in our district.

20236. What is the mining population of your district? What is the number of underground workers in the Midland

Digitized by Google

Mr. J. G. Hancock.

30 May, 1907.

district ?—I am not speaking simply of the underground workers, I am taking the total number employed, or the total number included in the inspector's returns.

20237. There are 103,000 persons employed and three inspectors. There are about 35,000 to an inspector ?—103,000 does not include those employed at the quarries and metalliferous mines.

20238. Including those, there would be something like 1 in 40,000. In your district you say that the inspectors ought to be doubled. The general result of your suggestion is that the inspectors should not only be doubled, but more than quadrupled if they are to visit each mine twice in the year instead of once, and if each visit is to take much longer than present visits. It is clear you want a great deal more than twice the number of inspectors ?—Yes.

20239. You yourself have suggested that perhaps 200 would not be an excessive amount ?—No.

20240. Do you think they should all be of the same class and receive much the same remuneration as the inspectors and assistant inspectors do now ?—No, I do not know that I am prepared to suggest that. I think that there might be inspectors appointed who had passed a certain examination and had some practical knowledge of coal mining simply for the purpose of inspecting mines, and not be subject to the same examination as the present inspectors.

20241. You would not pay them the same salaries as the present assistant inspectors ?—I do not see how that could be done.

20242. You would have a class of men employed who would get smaller salaries and who would not have the same qualifications ?—Yes.

20243. Do you suggest there ought to be more inspectors and assistant inspectors of the class that are now employed —the 40 or so now employed ?—I do not know that I make any suggestion upon that point: all that I am submitting is simply this, that the mines should be inspected more frequently than they are and more thoroughly than they are now inspected.

20244. You go on to say that you are of opinion that the size of districts should be reduced as time now spent in travelling without adequate recompense would then be spent in inspecting. If you reduce the size of the districts you must have many more districts, and I suppose you must have an inspector at the head of every district ?—Yes.

20245-6. Therefore you would require, if your proposals were carried into effect, more persons in the position of district inspector ?—Yes. I think that inevitably follows.

20247. Possibly each inspector might be satisfied, if you had more of them, with one assistant instead of two or three as they have now ?—Yes.

20248. So that possibly, although you would certainly have more district inspectors, you might do with about the same number of assistant inspectors as you have now ; and you would have further a third class of inspectors who would not be so fully qualified and receive smaller salaries. Is that your idea ?—Yes ; the third class of inspectors would be subject to the principal inspectors, would they not ?

20249-50. Yes, certainly. You would have three classes of inspectors instead of two. In the first place it would increase the present number of district inspectors ?—Yes.

20251. Each inspector of a district would have to have at least one assistant inspector ?—Yes.

20252. Therefore probably you would have at least as many assistant inspectors as you have now ?—Yes.

20253. Then you would have a third class who would be less highly qualified and consist of not less than 150 persons to make up the 200 ?—I could not say what the number would be. I should be guided by circumstances.

20254. You would have not less than 100 and perhaps as many as 150 of this new class of inspectors. That is your suggestion ?—Yes.

20255. Then you say that you cannot admit that inspecting a certain area and accepting that as a criterion of the whole of the colliery is satisfactory, reliable or safe. Do you say the only satisfactory, reliable and safe mode of inspection of a colliery is to inspect every hole and corner ?—That is so.

20256. With regard to General Rule 38, you know only one or two cases where the workmen have inspected the mines. You do not think that it is a question of expense, or that the owners should contribute, and your explanation of the disinclination of the men to avail themselves of Rule 38 is partly that their examination would relieve managers of a responsibility they ought not to be relieved of and places on the men a responsibility they ought not to have, and also that an unfavourable report might be detrimental to the examiner as a worker, and subject him to the harsh treatment of his employer. Take the first, that the examination by the men tends to relieve managers of a responsibility they ought not to be relieved of and places on men a responsibility they ought not to have. Have you had that position placed before you by the men ? —Yes: I give it there, if you will excuse me saying so, as the expression of the men themselves. I may say also that I endorse it myself.

20257. Why should not the men have a certain amount of responsibility for what goes on in the mines ? The men themselves are interested to a very great extent, and they may reasonably or unreasonably think the managers do not sufficiently care for their safety. In any case, must there not be some responsibility on the men unless you are willing to consider the managers infallible ?—There is the responsibility of the workmen always resting upon them for reasons given further on: they think that is a responsibility that ought not to be cast upon them, that is the responsibility of inspecting and reporting.

20258. I do not understand how it relieves the managers of their responsibility. I should have thought a manager under all circumstances would be responsible for what goes on in his mine, whether the men inspected or not. I should have thought that it was in the nature of a further precaution that the men should inspect. You go on to say that it is not so necessary because the mine managers attend to their duties better than they used to. If you have absolute confidence in them I can understand the men saying that it is not worth while to have inspections on their account, but I should hardly think they had such absolute confidence as all that. Mr. Ellis says it is very satisfactory to find that they should have so much confidence ?—I do not know that it is a question of confidence. I have not looked at it from that standpoint at all. My only submission is that the men do not undertake this inspection because they think if they presented a report it might be used against them later on.

20259. That is another matter. I was asking you to explain the first part of paragraph 5, that you think their examination tends to relieve managers of a responsibility they ought not to be relieved of and places on men a responsibility they ought not to have. I do not quite understand that statement ?—All I mean is this, if the men inspect the mine and report that it is safe and satisfactory and an accident occurs a little later on, that report will be brought up against the men undoubtedly, and on the manager's behalf.

20260. Of course it is a serious responsibility for a man to go down a mine, having power to inspect on behalf of his fellow-workmen, and declare that the mine is safe when it is not safe. You say they are not willing to take that responsibility on their shoulders ?—No.

20261. I can quite understand that view. Then you go on to say that an unfavourable report might also be detrimental to him as a co-worker. I understand it might be detrimental to him with his employer, but have you had any instance of a man being dismissed or harshly treated on account of his having produced an unfavourable report with regard to the mine ?—There has been no instance in Nottinghamshire so far as I know ; in fact there have only been two of these inspections made so far as I know.

20262. During the whole time you have been there since 1889 ?—Yes, I have only heard of two inspections being made at two different collieries.

20263. You think part of the reason they are not made is that the men are generally afraid, if they give an unfavourable report, it will go against them ?—I do not know that men are generally afraid of that, but this enters into this question.

20264. Have not men told you they are afraid ?—No.

20265. What reason have you to suppose that they would be afraid ?—I do not know that they would be afraid, but they simply say that it might be used against them.

20266. They do not know of any instance of it having been used against them, but they have some sort of dim notion, which apparently there is no substantial ground for, that if they give an unfavourable report, it might go against them with the mine officials ?—Yes: if you will excuse me I would like to say only some two or three months ago the men of a particular colliery were talking this question over and the committee was divided

Digitized by Google

in opinion as to whether an examination should be made or not. Part of the committee were opposed to it being made, and they urged this as one of the reasons, and the inspection was not made.

20267. Then you say that an unfavourable report might also be detrimental to a man making it as a co-worker. You mean the other men might object ?—Yes.

20268. Why would they object to a report he might make ?—His report might be unfavourable so far as some particular stall or district was concerned.

20269. Then he would get himself into hot water with the men working at that stall ?—The men in that stall or district, as the case might be, would very likely resent his unfavourable report.

20270. As you have only had two inspections during the time you have been in your present position, you have had no experience of that being the case ?—No.

20271. Then you say that the men really are incapable of making an inspection that is worth much. That is what it comes to. In paragraph 6 you say that such examinations must in every case be to some extent superficial and incomplete because these men do not understand and cannot measure ventilation, cannot read plans, indeed have little or no opportunity for seeing them. Surely there are men in the mines who hold even a first-class manager's certificate ?—Yes, we have men here and there who have done that.

20272. Surely they are capable at all events of reading plans and roughly reading ventilation ?—I am speaking of the general body of men.

20273. You would not entrust this inspection to an ordinary uneducated miner ?—No.

20274. You have men in your districts who hold first or second-class certificates ?—Yes.

20275. Would they not undertake this inspection and be competent to do it ?—I do not know. It would depend upon one or two things. In the first place I am convinced that there are not enough men in every colliery who have passed those examinations and hold those certificates. In the next place these men would not be selected in all probability by their fellow men.

20276. Why not ?—I do not know why. They may be or may not be selected.

20277. Surely there must be several men in your mines who have these certificates ?—There are.

20278. How many ?—I could not say. I have no idea.

20279. Quite enough I should think to carry out these inspections ?—I am inclined to question that.

20280. How many would you want to carry out these inspections ? How often should you suggest that the mine should be inspected by the men ? What would you consider to be a reasonable amount of inspection ?—I do not know that I can make any suggestion upon that point, but I think it would require at least two at every colliery.

20281. Who should be deputed for that duty ?—Yes.

20282. Surely you could always get two sufficiently educated to understand about ventilation and plans, could you not ?—I question that.

20283. You mean you are not sure that at some collieries there would be found even two men who had got the certificates ?—I do not think so.

20284. Then you say that the condition of the mine at the time of the accident may be very different to that at the time of the inspection. Still, at the same time, inspection is very desirable. It is not a reason I should have thought for not having inspection. In paragraph 7 you say that mines are managed much better now than they were, consequently there is not the necessity now for these inspections, and you also say there is not and never was, so far as your experience goes, any great desire on the men's part to make these inspections. That is even when they had much less confidence in the managers than they have now, they did not think it worth while to make these inspections, or, at all events, they thought there were such drawbacks to making these inspections, or that they got into such difficulties through making them, that it was not worth their while to make them ?—I am speaking of the last 30 or 35 years, and during that time there has not been to my certain knowledge a general wish, so far as the Notts miners are concerned, to make these inspections.

20285. That was apparently because they did not consider the inspections were necessary, but I understand that the principal reason was that they might get themselves into hot water either with their own workers or with the mine officials if they did make the inspections ?—I cannot say that that was the principal reason, but all the reasons I have given enter into the business and undoubtedly are reasons why these inspections have not been made.

20286. What do you say is the principal reason of the want of desire on the part of the men to make these inspections ?—I think the principal reason is indifference.

20287. With regard to General Rule 4, that is the inspection by officials, you say that the deputies and the shot-firers do not make the systematic examination of the mine they ought to do ?—They do not make the systematic examination I think should be made.

20288. How is that ? To what do you attribute their not doing so ?—I know that in some cases they will enter in at one gate and pass along the faces and down another gate leaving the intermediate gates not examined so far as they are concerned, and the shot-firer is expected to examine those gates, but he, generally speaking, acts in the same way as the deputy has done.

20289. In the case of the shot-firer and probably in the case of the deputy they do not do the duty, as a matter of fact, that they are supposed to do, and the duty that is entrusted to them ?—They do not go in and out along every gate or travelling road.

20290. Do not the managers of the mines make enquiries as to how the deputies understand their duties and the firemen understand their duties, and keep them up to the mark ?—Those enquiries undoubtedly are made and they know they understand their duties, but the men themselves report to me that that is the way in which they discharge their duties, and there are gates here and there which are not examined.

20291. When you get this information from the men do you not hand it on to the mine manager and ask him to see that the deputies and firemen perform their duties ?—I have not done so.

20292. Do you not think it desirable to go to the managers and explain the matter to them ?—I think it would be, but that evidence I only had last week.

20293. You get that evidence from the men and do not hand it on to the managers ?—I said I only got it last week.

20294. All the time you have been there you have not known of this alleged dereliction of duty by the deputies and the firemen ?—No, I have been to two or three collieries and questioned the men on this particular point and they tell me that is how the duty is discharged.

(*Chairman.*) You seem to be a long time in finding this out.

20295. (*Mr. Wm. Abraham.*) Do you think that the manager would accept you as an instructor ?—I do not suppose that he would.

20296. Do you not think he would strongly resent any interference on your part ?—Probably.

(*Mr. Ratcliffe Ellis.*) This is not a checkweighman.

(*Mr. Wm. Abraham.*) I know it is not.

(*The Witness.*) It would probably be resented and it would not be a very pleasant thing to do.

(*Mr. F. L. Davis.*) This information has not been known for long. It has only just been got up for this Commission within the last week. It has only been found out within the last week.

(*Chairman.*) Supposing that a manager might resent any interference on your behalf or any suggestion you might make, would not the manager be very glad to get information, at all events, from the men themselves, or the inspector, or any official of the mine. Would not the men, for instance, tell the inspector that they thought the fireman and deputy did not carry out their duties ?

(*Mr. Ratcliffe Ellis.*) Why could not the witness tell the inspector ?

20297. (*Chairman.*) You could tell the inspector without going to the manager. You might do that or the men might do it themselves ?—Yes.

20298. Or the men might tell the managers. I suppose the men would not like to go to the managers and, so to speak, peach upon their comrades ?—That was one of the questions you put on the list you sent to me, and it was after receiving that list and getting to know the points I should be questioned upon that I got this information.

20299. You say you have received this information from a good many men ?—From a considerable number of men.

20300. That in the opinion of the men the deputies and the firemen do not perform their duties properly ?—They do not examine every gate or travelling road.

Digitized by Google

Mr. J. G. Hancock.

30 May, 1907.

20301. It is part of the duty of the deputy or the fireman, to examine every gate, and that they do not do?—No.

20302. The firemen should be men of practical experience, that is men who have worked in the mine. Is not that usually so?—Yes.

20303. Do you know any case where it is not so?—I have heard of cases, but not recently.

20304. You think it is understood by the mine managers that the firemen must be men of practical experience?—Yes.

20305. Then as regards discipline, fines and prosecutions, you say generally speaking the men are opposed to any recognition of a system of fines. Do you find as a rule that the men would rather that their fellow workmen were prosecuted than fined?—No. What I mean is this, that generally speaking the men are opposed to any general system of fines being adopted between the workers and the employers, but they do not object here and there to people being fined who have done wrong and the offence can be met by a fine. They do object to anything like a general and collective recognition of the system.

20306. How would the men propose that discipline should be kept up in the mine? Would they prefer prosecutions to any general system of fining?—No; they think that discipline can be kept up without any general recognition of the system of fines.

20307. Or prosecution?—Fines or prosecutions.

20308. In what way would you keep up the discipline if you have no system of general fining, and hardly any prosecutions? Occasionally men would naturally say in their own interest that a workman should be prosecuted?—Yes.

20309. If there was any grave dereliction of duty it would be to their interest that he should be prosecuted?—I am not saying that there should not be fines or that there should not be prosecutions, but only at a very few of the collieries in Notts is there a general system of fines agreed upon, and still I think the discipline is kept up fairly well.

20310. How is the discipline kept up—by prosecutions?—Prosecutions and fines.

20311. I suppose the opinion of the men as to prosecutions would be that in very serious cases it would be in their own interest that a man should be prosecuted and not fined?—Yes.

20312. Supposing that the offence was not very serious, they think perhaps it would be met by a reprimand?—Yes, followed by a fine, very likely, if it was repeated.

20313. Then as regards the establishment of Special Rules you think that workmen could with advantage be asked for their opinion when Special Rules are being prepared; that is to say, that you would not have any Special Rules go so far as to be put forward by the mine owners until the matter had been threshed out between the mine owners, managers, and the men. You would have a sort of preliminary meeting, when the managers would suggest to the men the kind of Special Rules they wanted, and the men would consider those rules, and you think that no rule should be formulated or go so far as to be printed, perhaps—at all events should not be enforced—until the men had an opportunity of considering them?—Yes, I think that is a fair way of putting it.

20314. No Special Rule should be enforced—enforceable we will say—until the men had had some opportunity of objecting?—That is so.

20315. And you think that objections should be heard?—Yes.

20316. Before the rule is enforceable?—Yes.

20317. Then you say that you are in favour of some of the Special Rules being put into the General Rules, especially those relating to machinery, shafts, signals, managers, under-managers, deputies, and perhaps lamps and explosives. That is rather a considerable question?

(*Mr. Ratcliffe Ellis.*) Those are now provided for in the General Rules.

20318. (*Chairman.*) There are General Rules applicable to all these matters. I suppose your position is this, that the General Rules are not sufficient, that in almost every district it has been found necessary to supplement them by Special Rules, and there are certain Special Rules that are so generally necessary that they might very well be applicable to every district, and probably it would be found out, on comparing the Special Rules, that there are some Special Rules that are enforced in all the districts?—That is just what I had in mind.

20319. Can you suggest any particular Special Rules that are in force in your district that should be made General Rules?—None, excepting the ones that I have already referred to, the ones you have just read.

20320. "Relating to machinery": that is a mere general proposition with regard to the kind of matters that should be dealt with by General Rules. Do you suggest, for instance, that all the rules that you have in your district relating to machinery are so excellent and unobjectionable that they can be put into an Act of Parliament and made General Rules all over the country?—No, that is not my suggestion. I think that there are Special Rules relating to all those matters that are of such general application that they could be put in the General Rules.

20321. Some of them?—Yes; I do not say all.

20322. I was asking you to point out any particular rules which you think might be made General Rules. Have you any in your mind?—I have not any particular rule.

20323. You have not thought the matter out?—No.

20324. As regards haulage, you would like to have, separate travelling roads wherever possible. I suppose in an old colliery that would often be an extremely difficult and expensive matter?—I know one or two old collieries, very old, where they have separate travelling roads, viz., one I worked in.

20325. You think on account of the nature of the strata it would often be difficult to have a separate travelling road, I suppose?—Yes.

20326. By "wherever possible" you mean where the expense would not be prohibitive?—Yes.

20327. Do you think on one side at least in the whole district there should be plenty of room to walk? With regard to that it has been pointed out to us that sometimes where there is plenty of room to walk, the road may be very dangerous because this pathway that ought to be free and ought to enable men to step off the line at once into safety is often filled up with rubbish and débris in such a way that the men cannot walk along it?—Yes.

20328. Is that so in your district?—I cannot say that it is.

20329. You have not noticed that?—I do not think it is.

20330. You say that it would be a great advantage to have the refuge holes whitewashed on the edge and inside. That, I believe is generally done?—It is in our district.

20331. Perhaps you would suggest that that might be made a general rule, that all refuge holes should be whitewashed, and put it into the Act of Parliament?—It would be an advantage, I think.

20332. Do you think it is a matter of sufficient importance to be put into an Act of Parliament and made compulsory?—It is an important matter, but that it is sufficiently important to be made a general rule I would not like to say.

20333. I suppose the expense would not be great?—No.

20334. Then you say that roads should be as straight as possible, that the dip should be as regular as possible, hills and swamps being avoided. I suppose those are all things that should be looked to. In paragraph 13 you say you think that drags should be compulsory. What do you mean by "drags"—things to stop the trains going downhill?—Yes.

20335. (*Mr. F. L. Davis.*) It is a piece of iron sticking out behind the trams?—They are called "daggers" in some parts, and "drags" in others.

(*Mr. F. L. Davis.*) They are called "devils" in some places.

20336. (*Chairman.*) Here is a Lancashire Special Rule, which seems to meet your proposal: "Where the manager directs, the trailer or devil must be attached when the full load is drawn against the incline by means of a single rope or single chain other than a "lashing chain." That is merely where the manager directs. That means it is in the power of the manager to do it or not as he pleases. Would you suggest that in all cases the trailer or devil must be attached when the full load is drawn against the incline?—I think it ought to be done.

20337-8. You think it might be made obligatory instead of being in the discretion of the manager. Another Rule is, "Stop-blocks, warricks"—what is a "warrick"?—

(*Mr. Ratcliffe Ellis.*) It is something to enable the tubs to be stopped.

Digitized by Google

(*Chairman.*) "Loose rails or other safeguard shall be provided at the top of all jigs to prevent the trams accidentally running down, and the persons whose duty it is shall use the same." There, apparently, this must be done: it is not in the discretion of the manager. Would you suggest that this 50 (b) new Rule, Lancashire Special Rules, might be made a General Rule: "Stop-blocks, warricks, loose rails or other safeguard shall be provided at the top of all jigs to prevent the trams accidentally running down, and the persons whose duty it is shall use the same?"—Yes.

20339. You think that might be universally applied all over the country?—I do.

20340. That would, to a great extent, meet your point?—Yes.

20341. Then you say that over-chains should be used to check or stop any runaway trams, and competent persons, not inexperienced boys, should be employed. Over-chains are very often used, I believe. Do you think their use should be made compulsory where there is a train of trams, more than one tram going along the road?—Are you speaking of trams loaded with coal?

20342. Yes.—I do not know that I am prepared to go as far as that. I think they should be used where the men are riding in the trams.

20343. Do you find that any inexperienced boys are employed with these trams?—Yes.

20344. What aged boys are employed?—Boys commencing to work in the pits.

20345. The first thing they do is to go with these trams?—Yes, in some cases.

20346. Before they understand the danger?—Yes.

20347. On the other hand it would be desirable, probably, to have active young men employed in that duty, as the older men might not find it so easy to get out of the way. The younger you are the more active you are?—Yes; but if a boy commences to work in a mine at 14 years of age and has a year at other kinds of work, and gets to know something about the inside of the mine before he is put on to this dangerous work, I think it is better.

20348. You do not object to boys under 17 or 18 who have been at work in a mine a considerable time and who understand underground matters, being employed to look after these trams, but you say that boys ought to be employed at least a year in some other kind of work to accustom themselves to underground work before they are employed on these trams?—Yes.

20349. Then you say that each person should know his own work and be responsible for it, so that there may be no unnecessary division of responsibility, and that the engineman especially should not have any other duty. What duties does he perform at present which would interfere with his duty as engineman?—I cannot give any case of that just now, of that responsibility being divided. I have no case in mind, but I have heard more than once of enginemen being called upon to do other work that has taken their attention off their own particular work.

20350. What sort of enginemen?—A haulage engineman.

20351. (*Mr. F. L. Davis.*) Underground?—Yes.

20352. (*Chairman.*) A haulage engineman underground is sometimes taken away from his work and made to do something else?—Yes.

20353. Do you know whether that is a common practice?—I have known them called away to do their firing.

20354. (*Mr. Smillie.*) That is on the surface?—No, underground.

20355. (*Chairman.*) Do you mean firing shots?—No, putting slack on the fires.

20356. (*Mr. Enoch Edwards.*) Stoking?—Yes.

20357. (*Mr. Ratcliffe Ellis.*) In what part of the mine is the boiler?—In the pit.

20358. (*Mr. F. L. Davis.*) Whereabouts in the pit?—300 yards from the pit bottom.

20359. (*Mr. Ratcliffe Ellis.*) Were the men at the end where the engine is?—He would be some yards away from his engine. He would have to go round to his boiler to the other end of his engine-house.

20360. (*Chairman.*) How far—100 yards?—No, perhaps 50.

20361. You have known a man called away for stoking work 50 yards away from his engine?—Yes.

20362. Which he ought to be attending to, and you think that he ought always to be on the spot?—Yes.

20363. Have the men made any complaints to the manager upon that score?—Not that I know of.

20364. You do not know what the managers would say to that?—No. I have seen it done.

20365. You know yourself that it has been done?—Yes.

20366. Then in paragraph 14 you say, as regards other classes of accidents, that mine officials should be the only persons allowed to carry explosives, that they should fire all shots, recover unused or miss-fire explosives, and account for all that they receive. It has been suggested to us that the same person should not fire the shot and take down the explosive, but that there should be two different persons, one to take the explosive and the other to fire the shot?—Yes.

20367. Do you think that that would be a proper precaution, that in no case should the man who fires the shot take the explosive down into the mine?—Would they both be shot-firers?

20368. They would both assist at the firing, and to some extent the one would be a check on the other in case any one of them were to infringe the rule. There would always be two persons concerned in the shot-firing?—That does not come into conflict with what I have submitted, does it?

20369. No, you do not go so far as that. You say mine officials should be the only persons allowed to carry explosives, they should fire all shots. Therefore, according to you, you see no objection to a mine official taking down an explosive and firing a shot himself?—No.

20370. Then with regard to miss-fires, would you have any General Rule prohibiting a man from going to the place of the shot-fire for a certain time after the miss-fire had taken place? Would you say, for instance, that he must not go near the place for half an hour, or for some considerable time, in case the miss-fire shot should go off?—I think it is not advisable for him to go to the place again directly after, and I do not think they are allowed to do so.

20371. However, you have not thought that matter out?—No.

20372. Then you say that shot-firing should be done between shifts, especially in deep, fiery, and dry and dusty mines. Could you arrange for that throughout Nottinghamshire? Could that be done without seriously impeding the working of the mine?—I do not think that there are many pits in Nottinghamshire that would come under the designation of deep, dry, and dusty; perhaps the Leen Valley pits would, but comparatively speaking there is no shot-firing there. What there is is done between the shifts.

20373. So far as shot-firing is concerned, in your district you do not consider that anything further need be done with regard to making it compulsory, except that shot-firing should be done only between shifts?—We have no room to complain upon that point, I think, in Notts.

20374. In paragraph 15 you say that winding-enginemen might be compelled to obtain certificates of competency. What sort of examination should they have?—I do not know that I could define the kind of examination; I am not an engine-winder.

20375. As a matter of fact, do you find that the winding-engineman does not understand his duty sometimes?—No.

20376. An incompetent man is sometimes appointed?—No, not that I know of.

20377. You have no knowledge of that?—No.

20378. You consider enginemen as a rule are quite competent to perform their duties?—Yes.

20379. In fact you do not know of any instance where they are not competent?—No, I do not know of any.

20380. Then in paragraph 16 you say that detaching hooks and safety catches should be provided. No doubt there are types of detaching hooks and safety catches which are usually provided. Do you think it might reasonably be made compulsory to provide detaching hooks and safety catches?—I do not think they are usually provided in Nottingham.

20381. They are in some parts?—In some parts they are.

Digitized by Google

Mr. J. G. Hancock.

30 May, 1907.

20382. Do you think it would be reasonable to make it compulsory that they should be provided?—I know that there are objections to them in some places, but I think after all that they should be compulsory.

20383. You think they might be made compulsory?—Yes.

20384. Then you say that appliances for shutting off steam, applying brake and stopping engine at a certain point in case the engineman fails to do so, should be provided. There are appliances of that kind that are to a considerable extent, I believe, provided. Would you also make it compulsory that these appliances should in every case be provided?—That is a point that I do not think I can say much about. I read an article in the "Iron and Coal Trades' Review" upon this particular appliance. I do not remember much what it said, but it struck me that it was a very fine invention, and might be used with advantage.

20385. You have not gone very much into that matter?—No.

20386. (*Mr. F. L. Davis.*) Was that shutting off steam when the cage gets to a certain position?—Yes; I think it was called an "arrester."

(*Mr. Smillie.*) Bertram's, I think it is. If you think it is a good thing, why do you not think it would be well to recommend it as a general thing? You would not be prepared to give an opinion as to whether it should be provided or not?

20387. (*Mr. Ratcliffe Ellis.*) He is cautious; he does not want to recommend a thing unless he is sure that it is a good thing.—I put that qualification in; I do not know much about it; I have not seen it, and my only recollection which is a dim one, is an article I read in a mining journal upon this particular matter.

20388. (*Mr. Smillie.*) You have not seen it in practical use?—No.

(*Chairman.*) In paragraph 17 you say that wastes should be filled so far as dirt will do this, and no dirt brought to bank unnecessarily? I suppose that would be the rule in all collieries, that dirt should not be brought to the bank unnecessarily. That is rather a checkweighing matter, is it not, that they send dirt up unnecessarily?

(*Mr. Wm. Abraham.*) It is not the same question at all.

20389. (*Chairman.*) It is rubbish which has to be sent out. If it can be stowed away underground it should be?—Yes, that is my point, they bring it out sometimes because it is near to the pit bottom, and they can bring it out at less cost than put it into the workings.

20390. (*Mr. Ratcliffe Ellis.*) It affects safety?—Yes, that is my point, it affects the safety of the mine.

(*Chairman.*) As far as possible it should be stowed away underground and not brought to the surface.

20391. (*Mr. Wm. Abraham.*) Places are left empty which could be filled with this rubbish that is sent out. Where gas is it would accumulate in that place?—The wastes are not filled in some cases. There is plenty of room in the wastes for this dirt and rubbish, but instead of being drawn into the working faces and stowed there, it is put on to the cage and sent up, because the dirt happens to be near the pit bottom.

20392. (*Chairman.*) Then you say that iron trams are safer than wooden ones, especially in fiery mines. How are they safer?—I think they will not carry the dust.

20393. The dust does not so easily shake out of an iron tram. Is it more dust-tight?—I think there will not be the dust to shake out; the wood would carry more dust than the iron, would it not?

(*Chairman.*) That is rather a question as to whether the wood is well seasoned.

20394. (*Mr. F. L. Davis.*) It is less likely to crack and break you mean?—Yes.

(*Mr. Ratcliffe Ellis.*) The dust must be there; the iron probably will not be better than the wood.

20395. (*Chairman.*) In paragraph 19 you say that the employment of unskilled labour is dangerous, and should be discouraged. You mean that unskilled persons should not go to the working places?—That is so.

20396. Particularly with regard to timbering. A man ought to know something about timbering before he is allowed to go to the working place?—He would know something of timbering before he went to the working place, but what he had learned about it would be learned on the main roads

20397. With regard to timbering, do you suggest that it should be the duty of some mine official to go round to the working places constantly with a view to looking after the timbering, advising a man as to what he should do with regard to the timbering, at all events, if an inexperienced man?—No, I do not know that I suggest that; in fact, it is to some extent done now with regard to all the men.

20398. You have nothing to complain of in the way of the men being too much left alone in the matter of timbering?—No.

20399. Then you say that ambulance proficiency should be encouraged on the part of the officials and workers. I think that we all agree as to that. Then with regard to the investigation of mine accidents, you say that coroners in your district are all that could be desired, and that the relatives of deceased should have ample and clear notice of *post-mortem* examinations. Is that not so? Have you any complaints to make upon that point, that the relatives do not have sufficient notice?—We have had two cases quite recently where men had been killed, a man in each case, and the relatives of the deceased did not know that any *post-mortem* examination was being made until I told them at the inquest.

20400. How are they to know? How are persons who hold the *post mortem* to know who are the relatives? How do they find out?—In both of these cases the body was at home.

20401. It was known, and they deliberately did not send any notice to those persons well known to be relatives.

20402. (*Mr. Ratcliffe Ellis.*) You say that the body was at home?—Yes, it was at the house of the relatives. In one case the *post mortem* was made at home, and in the other case the body was removed, and in both cases the relatives did not know that a *post mortem* had been made until the inquest was held

(*Chairman.*) You mean relatives outside the house?

20403. (*Mr. Ratcliffe Ellis.*) Perhaps you mean in the house; the doctor came and they did not know what he was doing?—They did not know what he was doing. The coroner sent a doctor, and the colliery company sent a doctor, and in both cases the relatives of the deceased were not medically represented.

20404. (*Chairman.*) Even the relatives in the house did not know what was going on?—They did not know what was going on.

20405. Do you suggest any alteration in the law?—I do not know that I can suggest any alteration in the law, but I do think that it is very necessary that the relatives should be clearly informed that a *post-mortem* examination is going to be made, so that they can have the same opportunity of being medically represented at it as the employers have. The relatives of the deceased, generally speaking, are not so well educated as the employers, and the matter has to be put very plainly to them before they understand what it means.

20406. I suppose it is only in very exceptional cases?—They are exceptional, but we have had those two quite recently.

20407. It is not a great dereliction of duty on the part of the coroner, or whoever ought to give notice?—I think it was the constable and not the coroner.

20408. The constable ought to have told the relatives. It was his duty to tell the relatives, and he did not perform his duty. It was a case of an inferior officer not doing a statutory duty?—He did not make them understand what was going to be done.

(*Mr. Cunynghame.*) I think it is a matter of discretion; do not think it is a statutory duty.

(*Mr. Ratcliffe Ellis.*) I should think this case arose in connection with the Workmen's Compensation Act. That is where the difficulty arises sometimes.

20409. (*Chairman.*) Probably cases of that sort might be met by a circular being sent round to coroners (if those cases were at all frequent), telling them that they ought to take some steps to let the relatives know what was going on?—Yes, in one case the man had been injured by being struck on the head by a piece of stone thrown by another. It was quite accidental. In the other case the man ruptured himself; he was turning over some chains they were annealing and died a fortnight after; and in neither case were the relatives of the deceased represented medically at the *post-mortem* examination.

20410. (*Mr. F. L. Davis.*) Those cases were quite exceptional?—They were exceptional I am pleased to say.

Digitized by Google

20411. (*Mr Cunynghame.*) You would not like it to be made compulsory to send round to a widow a thing of that sort abruptly? You would not like to make it statutory? Giving notice to the relatives ought to be done a little judiciously, that is what I feel?—Yes, I feel the same.

20412. Can you suggest anything so that it should not go abruptly to the widow? It might go to the nearest male relative or something of that kind. If you make a law it has to be obeyed, and it might give great pain without a correlative good?—That is so. I do not see how it can be met by any statutory law, but I thought it was wise to mention the matter to you because they are unpleasant incidents we do not like to have.

20413. (*Chairman.*) Then as regards any further enquiry under Section 45 of the Act, you think anybody desiring an enquiry should be able to ask for one as of right?—Yes.

20414. That if any person interested thinks that the coroner's inquest has not, for instance, brought out all the facts that ought to be brought out you think that power should be given to any single person, however much interested he might be in the matter, to compel the Secretary of State to hold another enquiry?—When you say an interested person you mean a person interested on either side?

20415. Yes?—I think, if an interested person has reason to think that all the facts have not been brought out, and that an enquiry is necessary, it should be made.

20416. So that any person, in your opinion, supposing he was interested in the matter, and thought, or anybody else thought, that the facts had not been properly brought out, should be empowered to compel the Secretary of State to order another enquiry?—I do not know what you mean by any one interested person. All that I have in mind, just now, are the employer, on the one hand, and perhaps the widow it may be of the deceased on the other hand, or an organisation that the deceased was a member of.

20417. We will say then that if a widow thinks that all the facts have not been brought out, although she may in point of fact have nothing to go upon, but still if she wishes to have a further investigation, it should be compulsory on the Secretary of State to order one?—I think so. I think it is necessary to have all the particulars and place the matter beyond dispute, if possible.

20418. The last paragraph is about safety lamps. You say they are inconvenient, I suppose, because they do not give so much light as other lights. You also say they are injurious. In what way are they injurious?—They are injurious to the sight more particularly.

20419. Is that so?—Yes.

20420. What evidence have you got in support of that contention?—At present we have trouble with nearly every colliery owner in Nottinghamshire because so many men have had to come out of the pit owing to failing sight, and they have a difficulty in finding work on the top.

20421. Is this a new thing?—No, it is not a new thing.

20422. There is a disease?—It is nystagmus.

20423. We have had some evidence already, I think, about this disease, and it seems to be an open question whether it is caused by the dimness of the light or by a man working in a particular position?

20424. (*Mr. Enoch Edwards.*) Or both?—Or both.

20425. (*Chairman.*) That is what you mean by injurious, that it produces this particular disease?—Yes.

20426. You say the use of them should not be unnecessarily extended. There is a great deal in the word "unnecessarily." Do you think that the use of safety lamps is unnecessarily extended in your district?—I do,

20427. There are certain mines where safety lamps are in compulsory use, and you think, in some cases, that is unnecessary?—I do.

20428. I think the mine inspectors are of a contrary opinion. The drift of the evidence of the mine inspectors was that safety lamps were not employed in all cases where they ought to be?—That is so: that is their opinion.

20429. You put your opinion against theirs?—Yes, it may be presumption on my part, but I think they are in some pits where they ought not to be.

20430 On account of their producing this disease, and on account of it being less pleasant to work with safety lamps than with naked lights?—Yes, and, I think, the pits could be ventilated quite sufficiently to make them safe to work in with a naked light.

20431. You think that in some pits where safety lamps are compulsory that the ventilation might be so much improved that they might, with safety, use naked lights?—Yes.

20432. You have in your mind cases?—I have in my mind cases now of collieries near to where I live. The manager has given evidence before this Commission. I do not think lamps were really necessary in his pits.

20433. Even without further ventilation?—I do not think the manager himself, really believes they were necessary.

20434. Even without further ventilation they might be very well disused?—Yes, I think they could. I am not here to say his pits are badly ventilated. They are not badly ventilated, they are well ventilated.

20435. In some parts where the ventilation is not, perhaps, so good as it might be, it may be necessary, at present, until the ventilation is better to have safety lamps, but it might be improved so much that they would no longer be necessary?—Yes, I think that is possible in some cases.

(*Chairman.*) I think we all agree that they should be securely locked and thoroughly tested.

20436. (*Mr. Cunynghame.*) I should like to ask you about two points: the first point that I admit is puzzling me a good deal is the fine question. Of course, we must all concede that there must be discipline in mines where the safety of everybody is concerned. That is even more necessary than it would be in factories and places of that sort?—Yes.

20437. In mines it is particularly necessary?—Yes.

20438. I should imagine that the chief objection of the men to being fined was that the fine was inflicted by somebody belonging to the management and who is, as it were, judge in his own cause. Is that the real root objection of it?—Perhaps I did not make myself understood upon this point. My only point was this: the men do not object to being fined when an offence has been committed that will justify a fine, and I do not say that they should not be prosecuted if the offence merits a prosecution, but the men object to entering into an agreement with their employers whereby a system, or scale of fines is adopted. There is only one set of collieries in our county, that I know of, where that has been done, but fines are inflicted at every colliery.

20439. I do not think I have followed you thoroughly. Do not think I am asking you this antagonistically, because I only want to bring out all the facts as well as I can. If one does not object to a system I do not see why you should object to agreeing to the system. If the system is to exist, it is better that the men should have the option of agreeing than have it made against their will. Do you see my point at present?—Yes.

20440. If you do not object to the fines being levied I do not see much objection to making the men agree to them. I have not quite caught the meaning of that point?—The men would rather the matter remain as it does at most of the collieries in this way: there has been no agreement arrived at between the employers and the men concerning any fines that shall be inflicted in any case, but if a man does wrong a suggestion is made that he should be fined. Perhaps the manager makes it, and the men and managers are left very much to themselves to agree what the fine shall be.

20441. (*Mr. Ratcliffe Ellis.*) I think he means that it should be no part of the contract between the employer and the workman that he should be fined for certain offences. If he does commit an offence, both parties should agree to a fine for that particular offence. You see no objection to that? That is your view?—Yes, I see no objection to that.

20442. (*Mr. Cunynghame.*) The system you would advocate would be this: that it should be left to the two parties, always optional to the man to pay a fine instead of being prosecuted?—To some extent it is.

20443. Without a previous agreement that it should be open to the man who was about to be prosecuted to go to the manager and say that he would rather be fined instead of being prosecuted?—Yes, in some cases the offence can be met by a fine. If a man is in a good place, doing well, and is a good workman, and has committed a trivial offence, he may not have done it intentionally—that is a case we think a fine would meet.

20444. I was not endeavouring to get any admission that the men did not want to make. I wanted to know their real view, whether they object to the system of fines, or whether there is any system they would think reasonable and good?—The men have no general objection

Digitized by Google

Mr. J. G. Hancock.

30 May, 1907

that I know of to being fined where they have done wrong, but they have a very strong objection to an agreement being made with their employers.

20445. You mean a previous agreement ?—Yes, the same as we have at the collieries I previously referred to, where a list of fines has been agreed to by owners and workmen.

20446. They do not like a code of fines ?—No.

20447. They acquiesce in and prefer the option of paying a fine rather than being prosecuted in any particular case which arises ?—Yes. Then the men sign a document to the effect that they are willing to pay this fine.

20448. (*Chairman.*) Each case is decided on its own merits ?—Yes. If an offence has been committed and the owner and the man agree that it can be met by a fine, and the man is willing to pay a fine, say 2s. 6d., he simply signs a document saying that he is willing to pay this fine.

20449. (*Mr. Wm. Abraham.*) Is there not a poster hung up at the top of the pit explaining all that, before anything of this kind is done ?—I do not think there is.

20450. (*Mr. Cunynghame.*) At all events, that system, you think, does act well upon the whole ?—It does act well upon the whole in the opinion of our men in Nottinghamshire, and they do not desire any alteration. I am not authorised to say that they do.

20451. I suppose the complaint you were telling us about, that the men get by working in mines, is miners' nystagmus? —Yes.

20452. They get that with naked lights as well as with lamps sometimes ?—I do not know of any case where they work in naked-light pits.

20453. It is mostly lamps, I think everybody admits, but I think there are some with naked lights. You do not know, perhaps, about those ?—Nystagmus may arise from more than one cause. There is no getting away from this fact : our men suffer from it a great deal more where there are lamps than where there are not.

20454. I think that is conceded. I have heard a good deal of evidence upon that. I see a little difficulty from an administrative point of view in giving a second enquiry where there has been a coroner's inquest, which I will suppose in the opinion of all reasonable persons had thoroughly done the job of finding out everything. It seems to me a little injudicious to give to another person whose relative might have been injured a right of having what would be a somewhat extensive and expensive enquiry. Does it not seem to you that the object of the second enquiry is not so much to go into the details of that accident as to provide how such accidents can be avoided in future ? Does that not seem to you to be the case ?

20455. (*Chairman.*) The work of a coroner and a jury is to fix the blame on particular people, and after all the chief object of an enquiry afterwards is that you go into some general question of engineering which is of a wider character than the mere detail of that particular case ?—I am not aware that I went so far as to say every person, but if I did, what I had in my mind was this : I am not anticipating that anybody would ask for an enquiry of this kind who had not some standing, in a manner of speaking, or some authority, and I said the employer might ask for it, or I think some of you said the employer, or the widow of the deceased, or an organisation of which the deceased was a member.

20456. (*Mr. Cunynghame.*) For instance, where the coroner's jury had found a verdict of blame against the manager, I do not know that necessarily he ought to be able to demand an appeal as a right. Take a case of that kind. The jury have heard the case, and I do not know why it should be given as a right without convincing anyone that it was reasonable. In every case he would have a shot at a second enquiry to see whether it was better for him, but I do not see that he ought necessarily to have a right. It does not appear clear that you ought to give him an appeal in every case, whether reasonable or not?—All I have in mind is this : where any good purpose can be served by a second enquiry being given, it should be granted, but it is a difficult matter to say when the good purpose exists.

20457. Perhaps your real point is (it is my impression, rightly or wrongly) that the powers of giving subsequent enquiries to coroners' inquests might have been more liberally exercised in the past ?—I cannot call to mind any case where it has not been exercised when it might have been with advantage, but I think that the power ought not to be narrowed down at all.

20458. Do you not think, after all, that a Secretary of State, responsible to Parliament, is to be trusted with saying whether an enquiry should take place or not ? I suppose you must trust somebody ?—Yes.

20459. I want to put it candidly and fairly to you. After all, you cannot call to mind that he has done very great wrongs in the past apparently ?—No, it is difficult to say that a Secretary of State should not be trusted, but on the other hand I can quite understand a Secretary of State refusing to instruct the holding of an enquiry of this kind when it would perhaps be best for it to be held.

20460. He might make a mistake ?—Yes.

20461. But you are going to give in 1,000 cases in a year a right to relatives to put him right, and it seems to me that is a big order. You are going to give it to the owner, to the relative or anybody interested, and it seems to me a big order. That is what I mean. Have you an idea, if that was exercised to any large extent, what that would cost in money ?—I do not know. I did not intend to suggest that there should be more done than has been done in the past in that respect.

(*Mr. Cunynghame.*) Then it must be for the Commission to think how the question should be met. I do not want to press it.

20462. (*Mr. Ratcliffe Ellis.*) With reference to inspection do you agree with the view that was put before the Commission by Mr. Richards yesterday, that the object of the inspection by the inspectors is to see that the Mines Act is being carried out ?—Yes.

20463. It is not to manage the colliery ?—No.

20464. You think that each pit should be inspected twice a year at least ?—Yes.

20465. And that every part of the pit should be inspected ?—Yes.

20466. I suppose you mean every part at work ?—Yes.

20467. And accessible ?—Excuse me, every part at work and accessible. Some would be accessible and not at work. I think every part in which it is possible for a danger to lurk should be inspected.

20468. Would you inspect the goaf if you could get into it ?—No.

20469. You would inspect the working parts of the mine ? —Yes.

20470. And places contiguous thereto ?—Yes.

20471. You know the conditions down a pit vary very considerably ?—Yes.

20472. And vary at much shorter intervals than six months ?—Yes.

20473. Every week probably ?—Yes.

20474. What advantage would you expect to gain from that inspection every six months, considering the varying conditions of the mine day by day ?—I do not know that I can say what advantage we should gain, but I think we should certainly gain an advantage. I think we gain some advantage now by inspection.

20475. I should like you to remember the varying conditions of the pit day by day. What advantage would you expect to gain by an inspection every six months ?—We should gain the advantage of knowing that the mine had been well inspected by a disinterested person, and we should have the advantage of his report thereon.

20476. Would the examination you suggest every six months be by the Chief Inspector, or would you be satisfied with one by one of the Assistant Inspectors ?—I presume it would be by any of the persons appointed.

20477. Any of the staff ?—Yes.

20478. You say that men think their examination—this is with reference to the men's examination—tends to relieve managers of a responsibility. Do you not think that a too frequent inspection by inspectors would have the same effect ?—It may have.

20479. Do you not think it would ? Can you see any reason why it would not have the same effect ? If the men think an inspection by their body relieves the manager from responsibility, can you see any reason why it should not also follow that too frequent inspection by the inspector would have the same result ?—I am not prepared to say that it would be too frequent if twice a year.

20480. We will discuss frequency afterwards, but can you show any reason why too frequent inspection by the inspectors might not have the same result, removing from the responsible manager the feeling of responsibility ?—

Digitized by Google

It would very likely ease his position, but he would still remain the manager of the colliery and be responsible for the management of the colliery.

20481. You think it desirable that he should feel that he is responsible ?—I do.

20482. And that nothing should relieve him from that feeling of responsibility ?—No.

20483. The men in your district think an inspection by them would tend to relieve him from responsibility. You say here in your note, "Men think their examination tends to relieve managers of a responsibility they ought not to be relieved of and places on men a responsibility they ought not to have" ?—That is their opinion.

20484. Can you see any reason why the same should not apply to an inspection by an inspector, and that the result might be to relieve the manager from his responsibility ? Yes, the tendency perhaps is that way, but the whole of the responsibility would rest with the manager.

20485. The tendency is that way. Is it desirable ?—It is desirable to provide more inspection.

20486. Is it desirable that the manager should be relieved from the feeling of responsibility ?—I do not gather that he would be relieved.

20487. Is it desirable that he should ?—No.

20488. You think that it is not conducive to safety that he should feel that he is relieved from his responsibility ?—It is not.

20489. Forget for the moment the bi-annual inspection. That might be the result of a too frequent inspection by the inspectors ?—I cannot see that it would relieve him of any responsibility.

20490. Might not the result be if the manager knew the inspector had been round and said it was all safe, that it might relieve him from the responsibility if the inspection was too frequent ?—He might feel safer in his mind, but I do not know that there would be any deduction of responsibility.

20491-2. You say that the men think if they inspect the mine it will relieve the manager from his responsibility. Why should not the manager also feel relieved from his responsibility if the inspector inspects the mines too frequently ?—I cannot say more upon that point: I simply give you the men's view of it—the way they look at it.

20493. Do you consider that it is the inspectors' duty to do more than ascertain that the Mines Act has been carried out ?—No, I do not know that his duty is more than that.

20494. If you go down a pit yourself and do not inspect anything like the whole of the pit, cannot you see from the general way the work is being done whether it has been done under good management or under slovenly management ?—It depends upon how much of the pit I examine.

20495. Examine as much as you like; just a small portion of it: cannot you say from what you see by examination of a small portion whether the management is good or bad ?—I am not prepared to admit that examining a small portion of a pit justifies you in saying that the rest of the pit is like that.

20496. I am taking first of all the general aspect of the pit as it comes along. If you go round a section and find that all is in very good order, does that not give you some indication as to what the condition of the whole pit may be ?—It may give some; undoubtedly it does do.

20497. Supposing an inspector goes down a certain distance and there is every evidence of the management being satisfactory, does that not give a good indication as to the whole of the mine ?—I do not dispute that for the moment: but my point is this, that we need more than indications; we ought to have more than indications.

20498. You think, although it gives what you call a *prima facie* case in favour of good management, that is not conclusive ?—No.

20499. And you think by inspection twice a year you would get that ?—Yes.

20500-1. Although you agree that the conditions of the collieries are changing day by day ?—There must be changes, of course. I do not know that I said "day by day."

20502. I understand that you suggest that there should be a third grade of inspectors ?—No, I did not make the suggestion: it was put to me by the Chairman, and I said that I saw no reason why that should not be done.

20503. Do you think those inspectors of a third grade should be less qualified than the other inspectors ?—I do not think that there is any necessity for submitting them to the same severe examination that a principal inspector has to pass.

20504. In what particular matter do you consider they might be less qualified ?—I should think, if they understand ventilation and gases, and that kind of thing, that they would be qualified for this particular work of inspecting the mine.

20505. What other qualification do you suggest for a chief inspector beyond understanding ventilation and gases ?—I do not know. I do not know all that is expected of a principal inspector.

20506. If a man understood that, he would be pretty competent to manage a colliery ?—He would know something.

20507. I want to see what difference you would make in the qualification of the third grade and the first and second grades.—I cannot say what differences should be made, but I am not prepared to say that those third-grade men should have to pass the same examination as the first-class inspectors have to pass.

20508. I want to know why not ?—They would not occupy the same position.

20509. They must, I suppose, be able to measure ventilation, read plans and understand gases ?—Yes.

20510. Do you see any advantage in having a man less qualified than a chief inspector ?—If you can have chief inspectors all the way round I have no objection to it, but I do not see how you can.

20511. Your assistant inspectors would become chief inspectors in time. Do you see any object in having a less qualified man ?—I think you should have the best qualified man for the particular work.

20512. What is he to do ?—To inspect the mines.

20513. To inspect the mines he must understand ventilation and gases, how to measure the ventilation, and read the plans. He must understand all that ?—It has not been made clear to me that this man should necessarily have the same qualification as the chief inspector, but if it is necessary for him to have that——

20514. I want to know what you expect to get from this man less qualified other than you do from a better qualified man. Is he to do exactly the same work as the chief inspector or the assistant inspector ?—He would have to inspect the mine.

20515. Inspection is the great point we are aiming at. Is he to be supposed to make an inspection of the mine to the same extent as the chief inspector would be able to do ?—I think so.

20516. Why should he not then be equally qualified: why should he be less qualified ?—I have no objection to his being equally qualified.

20517. Do you see any advantage in his not being equally qualified ?—He should be qualified for his work, but I am not prepared to say that he should have the same qualification as the chief inspector.

20518. I want to know why he should not have it.—Because I am not clear that it is necessary.

20519. Is it necessary that a chief inspector should be qualified in that way as he is now ?—It is necessary for him to be qualified for his work.

20520. I do not understand: the object of all the inspectors is inspection, to see that the Act is carried out ?—Yes.

20521. I cannot understand why you think one grade should be less qualified than another ?—I do not say that they should be. I simply say that it is not made clear to me that he should have the same qualifications as the chief inspector.

20522. Can you make it clear to me why he should not ? That is where my difficulty is. He has to do the same work: why should he not be equally qualified, and be able to advance to the post of chief inspector when opportunity offered ?—I do not know that he would have to do the same work all round as the chief inspector.

20523. Can you suggest what he would not have to do in the way of inspection ?—Not in the way of inspection.

20524. For the purpose of inspection he ought to be qualified as well as the chief inspector ?—Just for the purpose of inspection.

20525. The purposes of inspection include everything so far as safety is concerned, do they not ?—That may be.

Digitized by Google

Mr. J. G. Hancock.

30 May 1907.

20526. You can give no reason why he should be less qualified?—Except the inspector may have other duties—that is, the principal inspector.

20527. You can give no reason incident to safety why he should be less qualified?—No.

20528. Then, with reference to inspection under General Rule 4, do you think the districts of the deputies are too large sometimes for examination purposes?—I think it would be better if they were smaller in some cases.

20529. Can you make any suggestion that any rule can be made as to the size of the districts?—No, I do not know that I can, but in some cases they have a larger district to travel than they can travel within the time and examine it—in and out, that is.

20530. You cannot suggest any rule which could be formulated; that must be left to the management?—And to the circumstances.

20531. Left to the manager to decide in each case what he considers a sufficient district. The deputies you have recently heard do not examine all the stalls. What examination does that refer to?—I say they do examine the faces and lips; it is the intermediate gates.

20532. What examination does that refer to?—The morning examination.

20533. Before the men go down?—Yes.

20534. How do they know that they do not examine these?—It is a matter of common knowledge that the deputy enters at one gate and goes through the faces.

20535. This is an examination made before the men go down. How do the men know he does this? I can understand any examination during the shift they could give information about, but I do not understand how they can tell you what he does before they go down the pit?—They know what distance he can do in the time.

20536. Is it a conclusion? They do not know that he does not visit the gates?—They know he cannot travel it.

20537. Is that the reason they give you that information?—Yes.

20538. That has been in existence for a long time, I suppose. The deputies have had the same districts to travel for some time?—Yes.

20539. Can you account for no complaint having been made before by the men?—I do not know that we are complaining now particularly. I am simply stating what I believe to be a fact.

20540. You believe it to be a fact because the men think the distance is so great that he cannot do it. He has to put this chalk mark on where he inspects?—At the gate ends.

20541. Yes. They think he does not inspect, although the chalk mark is there?—He does inspect the faces and the lips and the gate-ends, but he does not inspect the travelling roads.

20542. How far away from the faces do you think he does not inspect?—He does not inspect down the intermediate gate roads.

20543. The travelling roads?—Yes.

20544. They are inspected by somebody?—Not in some cases.

20545. Does not the Act of Parliament provide that the travelling roads have to be inspected?—Yes.

20546. In your case the Act of Parliament is not carried out?—No.

20547. You do not want an alteration of the law, but an alteration in the administration of the law?—Yes.

20548. The evidence upon which you make the suggestion is not that the men have seen it, but they think the distance is so great he cannot do it?—They are sure it is.

(*Chairman.*) I understood the witness distinctly to say they had stated in so many words that this inspection was not carried into effect?

(*Mr. Ratcliffe Ellis.*) He did say so.

20549. (*Chairman.*) It seems all you have heard from the men was that the districts were so large that it was impossible that it should be done, and not that as a matter of fact it was not done?—The men say it is not being done.

(*Chairman.*) How do they know?

(*Mr. Smillie.*) Will you put the question to him—are there men working in the night time who do see the firemen?

20550. (*Mr. Ratcliffe Ellis.*) Are the men who give the information the men working in the night time?—We have it given to us by night men and day men too, that they do not travel all these gates, neither shot-firer nor deputy.

20551. Because they cannot do it, or that they have seen they do not do it?—In some cases they have seen that they do not do it.

20552. You had no complaint as to this from your men until you enquired whether it was done or not?—No.

20553. I think we have cleared up the question of fines, and you and I agree upon that that the system of having a general contract that a man must pay a fine and advertise it is objectionable?—Our men will not accept it. I do not agree with it.

20554. I agree it is objectionable. You do not see any objection if the two agree together, after the offence is committed, to a fine being paid?—That is done.

20555. I want to ask you about making Special Rules What is your objection to the present method of making Special Rules?—My only objection is that I think the workmen could be consulted with advantage.

20556. The Act of Parliament obliges an employer to propose Special Rules?—Yes.

20557. It is his duty to do it?—Yes.

20558. It empowers the Home Office to object to these Rules, and, failing agreement, it goes to arbitration?—Yes.

20559. The rules being once established, the owner can propose an amendment to a rule and submit it to the Home Office, and the same proceeding is gone through, and if they do not agree it goes to arbitration?—Yes.

20560. The Home Secretary can propose a rule, and if he and the owner do not agree, it goes to arbitration?—Yes.

20561. At what point do you say the workmen should come in?—Some 10 or 12 years ago the inspectors in our district asked the employers and the men to meet for the purpose of considering an Order that had been issued with regard to explosives, and talk the matter over. The meeting took place, and I was there, and I was convinced then, and I have been convinced ever since, that if meetings of that kind could be held when Special Rules are about to be suggested, it would be to the advantage of both sides.

20562. What is to prevent it being done now?—I do not know of anything to prevent it, but it is not done.

20563. That was done by the inspectors, and both the employers and the workmen met together, and that could be done now if it was done then?—It would be an advantage if it was done.

20564. Do you want to make that compulsory?—So long as that point is realised I do not know that it should be compulsory, although, if it is compulsory, of course it would have to be done: there would be no loophole.

20565. Do not suppose that I am objecting to these meetings. I want to see how it is going to be carried out by Act of Parliament. Supposing the owner wishes to propose a Special Rule, is he to be bound to have the assent of the men before he can propose it?—I would not say that he is bound to have the assent of the men, but I would say that the men should be consulted.

20566. With what object?—Because they are interested in the Special Rules.

20567. Suppo ing you can propose the rule without the men's consent, what is the object of debating it at that stage?—On the ground of common justice, I say the men should be consulted.

20568. You say the men should not have a right of veto. Whether the men like it or not he should be entitled to propose his rule?—If there was some fractious or captious opposition to a rule that was obviously necessary, then he should have a right to enforce it.

20569. I take it that the opposition is not captious, but that the owner says, "I do not agree with you: I am going to propose the rule." Do you think he should have a right to do so?—I think the proper thing would be to go to arbitration.

20570. At this stage, when I want to propose this rule do you say the men shall be entitled to say, "You shall not do so"? You do not go so far as that?—No, I think we could not.

20571. Would this meet your views: If the owner is left at liberty, as he is now, to propose a rule, that when it gets to the Home Office it should be advertised, and anybody interested should have a right to object to it, men, or Home Office, or inspectors; if those objections cannot be removed, then that the question should go to arbitration as to whether the rule should be established or not, and that

Digitized by Google

persons who object should have a right to be heard ?—I see no reason why the men should not be consulted before it goes to the Home Office.

20572. If the men are not to have a right to say you should not propose that rule, why should they be consulted ?—The men would not object to anything that was reasonable.

20573. Supposing the men did object, you agree that the owner is still entitled to propose his rule ?—Provided it was obviously necessary, I say.

20574. Whether obviously necessary or not, I understood you to say that notwithstanding the men object he should go on ?—I did not say that he should have a right to propose a vexatious and oppressive rule.

20575. How do you draw the line ? Do you say that the owner shall not propose a rule that the men do not agree to ? You cannot prevent rules being proposed that are essential to safety. If you do not go to that extent, what is the use of discussion with the men before the rule is proposed ? I agree, before the rule is established, the men should have the fullest opportunity of criticising it, and their objections should be considered by the Arbitrator, if necessary ?—That is just my contention.

20576. Then you agree with me ?—But I cannot say the owner has no right to propose the rule. I say he has a right to propose any rule he thinks necessary, and the men should have an equal right to consider it before it goes to the Home Office.

20577. That is where we do not agree. I want to know why it should be so. What use would be served if the owner can send it to the Home Office, whether the men like it or not ? Is it not the proper time for the men to object when the rule is sent to the Home Office and they advertise it, and say the owners wish to establish this ? Then the men can object, and if they cannot agree they can go to arbitration ?—The men should have the opportunity of considering it before it goes to the Home Office.

20578. Supposing the owner is prohibited from proposing a rule, many rules, which are essential for safety, would not be proposed at all if he is bound to have the sanction of the men to the rules ?—I do not think that would be so.

20579. The haulage roads were referred to. You are rather looking forward to new workings where the haulage roads can be made straight and you can have separate travelling roads and other arrangements of that sort. That is your view ; you are looking to the future, rather ?—I do not know that I was.

20580. You do not think in the present collieries, the old collieries, that they would stand the expense of making separate travelling roads ?—I said, I think, that where they could they should be made.

20581. Upon the question of explosives, you do not have much shot firing in your district ?—No, comparatively speaking.

20582. Your view is that the workmen should not be entrusted with the explosives ?—That is so.

20583. That should be in the hands of the officials ?—Yes.

20584. Do you agree that the explosives should be supplied by the owner, that the men should not be entitled to buy where they like ?—Yes.

20585. You agree that the owner should supply them ?—Yes.

20586. (*Mr. Wm. Abraham.*) With regard to inspection in general, you believe in the necessity of inspection ?—Yes.

20587-8. You believe that good as been done by mines being inspected in the past ?—Yes.

20589. It is your wish that that inspection should be made more thorough and efficient ?—Yes.

20590. Is there not some difference between the inspection made by workmen on their own behalf and inspection made by the inspectors on behalf of the Government ?—Yes, there will be some difference.

20591. While it is the object of the inspectors of the Government to see that the Mines Act is carried out, is it not more the object of the inspection made by the workmen to see the immediate condition of the work ?—That is their only object, I think.

20592. In your opinion, it is that kind of inspection that is needed ?—Yes.

20593. It is for that kind of inspection that you would have this new grade ?—Yes.

20594. They do not need, to do that effectively, the same high qualification as the first-class inspector ?—That is so. That is the reason I said I saw no necessity for it.

20595. You have told us you have not had much experience with inspection made by workmen ?—No.

20596. Have you noticed that the law prevents workmen appointing examiners on their own behalf who are mining engineers ?—Yes.

20597. All this talk about having the same qualification is unnecessary ?—I think so.

20598. It is an unnecessary qualification for the men to possess to assist in the efficient inspection of mines ?—Yes, I do not see any necessity for them to have the chief inspector's qualifications for that work.

20599. Persons employed in a mine may, from time to time, appoint two of their number or any two persons not being mining engineers. You have not had any great experience in your district of this, but do you know that the reports of the inspections, made by these men, are brought forward as proof of safety of a mine after an explosion ?—Not in our district.

20600. You do not know that. Your district, as a rule is rather exceptionally free from gas ?—I do not remember an explosion resulting in loss of life.

20601. It is free from falls of roof ?—Yes, I think so, fairly.

20602. It is exceptionally free from mining accidents altogether?—Would you just let me qualify an answer I gave a second ago when I said I did not recollect an explosion from gas causing loss of life. I do recollect one.

20603. In your lifetime ?—Yes, it is only a year or two ago. It was a deputy.

20604. Is it the practice in your district not to fill the trams over the brim ?—They do not fill them over-hanging the brim, but they are filled considerably higher than the empty tram. The coal is heaped up on the tram.

20605. How high ?—It will vary. Where they have these thick seams and thick dirt coming on the top, they put as much on the tram as they can. Their average weight will be 14 cwt., or 15 cwt.

20606. We saw the trams filled in that way ?—Level full ?

20607-8. About level full ?—In other cases they will be a foot or 18 inches above the side of the empty tram : I mean, the coal will.

20609. Is this colliery we saw in Nottingham exceptional for Nottingham itself ?—No, I cannot say that it is. You are speaking of Cinder Hill.

20610. You cannot say it is not exceptional ?—Not exceptional.

20611. With regard to the question of fines, what is your own opinion with respect to them : I mean as between fining a man and taking him before the magistrate. Does it affect the discipline of the mine?—I am not quite sure that I can answer the question in a very few words. My own opinion is this, that all things considered the system we have in Nottingham is a system which I do not see can be improved. The only complaint that is made at times is that the fine, in the case of a man, is somewhat excessive. There are cases here and there where the man refuses to pay the fine, and perhaps the owner will discharge him.

20612. With regard to this point that men do not exercise their right to examine the collieries, is it or is it not the fact that that kind of interference is so unpopular that you cannot get the best of your men to do it ?—They will not do it. They will not examine.

20613. (*Chairman.*) The best men will not. You cannot get any men, good, bad or indifferent, to examine ?—Generally speaking the men will not do this.

20614. You do not mean to say the good men are especially shy of conducting these experiments ?—No.

20615. You have no more difficulty in getting good men than bad men ?—There is a general reluctance to do it.

20616. (*Mr. Wm. Abraham.*) I will put it again : do you not find a greater reluctance on the part of men who have passed their certificates and who are considered to be the more intelligent of our class to do this kind of thing ?—I think there is.

20617. (*Chairman.*) The good men are more reluctant to undertake this work than the indifferent men ?—Generally speaking they are looking forward to a higher position, to becoming managers themselves.

Digitized by Google

Mr. J. G. Hancock.

30 May, 1907.

20618. They might jeopardise that by something they would report?—Yes.

(*Mr. Ratcliffe Ellis.*) He has never had an instance where that has been realised.

(*Mr. Wm. Abraham.*) That may be so, but there it is. I am only bringing out the fact: that is all.

20619. (*Mr. F. L. Davis.*) Do the men in your district take the responsibility of reporting dangerous conduct, or breach of the rules on the part of their fellow-men to the managers?—To the officials.

20620. To the officials?—The officials report.

20621. My question is, do the men. Where cases come within the knowledge of the workmen of a man breaking a rule, putting his fellow-men in danger, would they then take the responsibility of reporting that?—Yes, I think the men would report it.

20622. I am afraid the responsibility is exaggerated very often, and they do not. There are more of them who are interested in the safety of the mine just as managers are?—Yes, I think they realise that.

20623. I did not understand what you meant by saying that the workmen's inspection report would tell against them. I can understand it telling in favour of the manager by producing that report and saying "Here is the mine inspected by the men themselves within the last week, and they said everything was satisfactory": but how can it tell against the men?—I think I put it that an unfavourable report might tell against the men: that is as a co-worker.

20624. That I understood, but I think the way in which you put it was rather different. I can understand the inspection telling in favour of the manager, and I do not see any reason why it should not be used. Supposing an accident did happen and he produced a report from the men that a few days ago, a week, or whatever it was, as far as they could see everything was satisfactory?—That is the other point.

20625. A favourable report?—Yes, that is where an accident has occurred perhaps a month after an inspection has been made. What I meant was this: when the men inspected the mine, say a month prior to the accident, so far as they knew the mine was in a satisfactory condition, but their lack of technical knowledge is such that their report might not be worth a great deal, I think I put it in that way, in addition to which the conditions of the mine may have changed considerably during the month.

20626. I do not know that I should quite take that view. We all know, as we hear to-day from you, and we all agree, that the conditions of the mine change day by day. It is quite possible a report given a month before might not have much effect upon what would happen yesterday?—That was my point.

20627. Do you yourself, as representing the men, or any of your fellows, make a point of informing the inspectors when you hear that there is anything wrong at the mines, that the men think is wrong, the rules being broken, or the mine being in a dangerous condition; do you inform the inspector of that?—I have not informed the inspectors yet. I have never communicated with an inspector at all upon matters of that kind. If any breaking of a rule was brought to my notice I should communicate with the manager himself at once. We have a good class of manager in Nottingham, and we are on very good terms all round.

20628. That is very satisfactory indeed?—I should not go to the inspector.

20629. I think that is done very largely in our district in Wales, but in some cases possibly where the miners' agent is not on such good terms with the manager he would inform the inspector. I am not complaining. The inspectors have told us in their evidence that they get a number of communications from men suggesting that they should go to such and such a colliery?—Yes, I know.

20630. In your district you have had no occasion to do that. You go straight to the manager if you have anything to complain about?—Yes; we can approach every manager and go into all colliery offices.

20631. (*Mr. Enoch Edwards.*) Your experience is of Nottingham and Nottingham only?—And a little of Derbyshire. I am a Derbyshire man by birth.

20632. Your district is not considered to be dangerous from either dust or gas?—No.

20633. That may be one of the reasons why the workmen have not had such frequent inspections of some districts?—It may be.

20634. At no time in your colliery has there been any fear that the place is going to be blown up by gas?—No.

20635. So that there was really no very strong ground for appointing workmen to make these examinations?—No.

20636. Then you say you think that there should be more inspectors, you refer to what has been accepted as some sort of other class of inspectors. You have in your mind a person to inspect the mine?—Yes.

20637. Frequently?—Yes.

20638. Mr. Ellis was very anxious to get to know from you why there should be a difference between these particular inspectors and the chief inspectors?—Yes.

20639. Of course we have now in managing pits degrees of management: we have orders from a manager, an under-manager, an over-man, and a fireman?—Yes.

20640. The fireman is the man who does the examination?—Yes.

20641. Is that the type of inspector you mean who shall examine?—That is nearer the type than the principal inspectors.

20642. That is to say, a principal inspector must have a complete knowledge of electricity? It would not be necessary for the man you have in your mind to possess all these degrees in these higher technical subjects?—That is what I mean.

20643. You want a kind of inspection that is made in the mines now as part of the rules by the Manager, the under-manager, the overman and the fireman. They all take part in the management of the mine?—Yes.

20644. The chief of it is done by the fireman?—Yes.

20645. So far as it deals with ventilation and gas, and so on?—Yes.

20646. Mr. Ellis was rather anxious to get you to admit that there may be what is called too frequent inspection?—Yes.

20647. I think you said that the mines should be inspected twice a year?—Yes.

20648. Every mine?—Yes.

20649. And when you say every mine you mean every seam in a pit?—Yes.

20650. You would not think that too much inspection—twice a year?—No.

20651. Of course the inspection by an inspector is hardly the inspection of a workman, after all?—No.

20652. The workman is supposed to make a report; I do not know whether you have seen the form they have at collieries?—Yes.

20653. He reports, and that report is kept in the colliery office?—Yes.

20654. You are not aware whether the inspector reports at all?—I am not aware that he does.

20655. He does not leave a report behind him?—I am not aware that he does.

20656. On his visits he may give orders to carry out the Act under which he is appointed, and to see that it is carried out. He would give such orders?—Yes, and I have heard managers say before leaving that he has told them he was satisfied with the mine so far as he had seen it.

20657. You think twice a year to examine these mines would not be too frequent inspection?—I do.

20658. Have you any knowledge of how far the inspections now in Nottingham extend through the colliery and the seams of the various pits? Does the inspector visit all the colliery when he visits?—The whole of the colliery.

20659. Yes?—No.

20660. If he is inspecting for a sample he may take at the instance of the management the best sample?—Yes.

20661. They usually know when he is coming?—Yes.

20662. At least it is common talk among the workmen, at any rate?—Yes.

20663. So that it is possible, unless he examines the whole of the colliery, that he sees as a sample a particular seam, which may commend itself to him as safe, while the other parts of the pit which he does not see may not be so secure or certain?—That is so.

20664. As to the question of fines, I understood that what you objected to was a sort of schedule of fines?—That is so.

20665. As if it were a table of articles for sale?—Generally speaking they object to it, but at half-a-dozen collieries they have a schedule.

Digitized by Google

20666. They object to a schedule of fines being put up as if you were keeping an establishment for the sale of articles ?—Yes.

20667. In the judgment of the men they could arrange the discipline beforehand by a sort of easy method of 3d. or 6d. for this or that ?—They have this schedule, and I have no reason to think that discipline is better maintained than where they have no schedules.

20668. From what you know of it the men object to it. It does not affect the safety of the mine ?—I do not think it does.

20669. In the case of fines, who generally lays the information ? If a man has committed a breach of a rule, who generally lays the information ?—The deputy, or some other official.

20670. They would not be cognisant of the breach unless reported to them by somebody else ?—Supposing props are too far apart.

20671. I am talking generally. If the deputy goes in a place and sees the props that should be set every 4 ft. 6ins., according to arrangement, are set every 6 ft., he has a clear knowledge of the breach of the rule himself ?—Yes.

20672. The fireman largely would be the man who would be in contact with these men; they are more under the eye of the fireman than under the eye of the manager ?—I say the deputy, generally speaking, would be the person to lodge the complaint. "Deputy" and "fireman" are used in our county, but they are the same. In one case it is the deputy, and in another case the fireman.

20673. (*Chairman.*) They perform precisely the same functions ?—Yes.

20674. (*Mr. Enoch Edwards.*) A fine would be posted up by the management where the case is not taken before the Court ?—On the bank.

20675. In the colliery office ?—I cannot say that is done.

20676. In the absence of a schedule the fines are inflicted at the colliery office. Do they consult the man as to how much the fine should be ? Who fixes the fine ?—The manager says in his opinion that the man should be fined, and of course the man is told that. If he thinks the fine is unreasonable he says at once he thinks it is unreasonable, and I have known the fine to be reduced by the man protesting against it.

20677. I have not got there yet. I want to know who is responsible for fixing this fine. Is your Union, or organisation, or the checkweighman of the man, or anybody else consulted at all about it ?—The manager always suggests the fine except where they have a schedule.

20678. He would not delegate that to a deputy ?—No.

20679. The fireman would not fix the fine ?—No.

20680. Nor the under-manager ?—The under-manager might.

20681. Usually the manager would fix it ?—Usually the manager.

20682. The certificated responsible manager of the pit would fix the fine ?—Yes.

20683. The man is expected to pay it ?—Yes.

20684. The other alternative, I suppose, is to take his tools ?—Yes.

20685. He can always do that ?—Yes.

20686. I understood you to suggest if a man had a good place and was doing pretty well, whatever the fine was, even if it was rather stiff, he would rather pay it than lose his place ?—Yes.

20687. If the man is told by the manager that the fine for a certain offence will be 10s., they stop it off him if necessary ?—Yes.

20688. He does not take it to the office ?—He consents to it being stopped.

20689. He does not take it to the office ?—No.

20690. He does not pay for it ?—In some cases it is paid, and in others it is deducted, but he signs a written declaration to the effect that he is willing for it to be deducted.

20691. They collect these fines in the office ?—In some cases. In some cases they pay the fine before they draw the money on the Friday night. Supposing the offence is committed on the Wednesday, the man would pay the fine before he drew his money.

20692. (*Mr. Ratcliffe Ellis.*) Have you ever known cases in which it is put over two or three weeks ?—Yes.

20693. (*Mr. Enoch Edwards.*) I understood Mr. Ellis, in quoting the Truck Act, said where the fine was excessive that he could go to Court and get it back ?—Yes.

20694. You say you have known them, where the fine has been too heavy, give it to them back. You have known them return it ?—I have known them reduce it.

20695. You have known them reduce it where there is an agreement ?—Not where there is a schedule of fines.

20696. The colliery manager in his office fixes this fine ?—Yes.

20697. He does fix it at too much sometimes ?—Yes. Well, at any rate he has fixed it and it has been reduced; the man has objected to it afterwards, and it has been further considered, or re-considered, and the manager has reduced it.

20698. Does he not object at the time ?—He objects when he is told what the fine that is proposed is.

20699. Is general discipline maintained by the management in any of the Nottingham collieries without resorting to fines ?—I cannot say that there are any collieries where fines are not, at times, inflicted.

20700-1. Do many take the men to Court ?—We have not many prosecutions; I could not say how many, but I do not think that there are many, comparatively speaking.

20702. You are clearly of opinion with regard to the new Special Rules for a colliery, before a rule is sent up to the Home Office that it should be submitted to the men ?—Yes.

20703. You think by that means you would be able to establish rules which would work more smoothly ?—I do.

20704. You have no doubt in your mind that it would interfere with the safety ?—I do not think it would. I have no reason, whatever, to think that.

20705. Do you think men, generally, would realise that a rule, although many of the rules have a considerable bearing upon their wages and contracts, has a bearing on the question of safety ? Do you think the men are very keen with regard to the question of safety ?—They would not object to any reasonable and fair rule.

20706. It has been suggested that there was that possible advantage that it might not be possible to get rules which would throw some onus on the workmen and which would be desirable in their interests if the men were consulted ?

(*Mr. Ratcliffe Ellis.*) Not possible to get beyond the first stage.

20707. (*Mr. Enoch Edwards.*) You think it would not hinder it by consulting the men ?—I am well convinced, in my own mind, that we should never have the trouble that Mr. Ellis apparently anticipated.

20708. (*Mr. Ratcliffe Ellis.*) In Nottingham ?—I do not think we should anywhere in the country.

20709. (*Mr. Enoch Edwards.*) Your men feel that before the rules are sanctioned by the Home Office or anybody else, they should be consulted in regard to them ?—We have been consulted by colliery companies, here and there, when they have wanted an alteration in the Special Rules, and it has worked well, and it is that experience which makes me think it would be admirable if generally done.

20710. (*Chairman.*) What I understood you wanted was not that the rule should be submitted to the men before being sanctioned by the Home Office, but submitted before they were even sent up to the Home Office ?—Yes.

20711. That the mine owners should not have committed themselves in any way to the sanctioning of any rules before the men had been consulted ?—That is so.

(*Mr. Ratcliffe Ellis.*) That they should not be allowed to propose them ?

20712. (*Chairman.*) Yes, should not be allowed to propose them to the Home Office until the men have been consulted, although, if the negotiations between the men and the masters broke down, the masters would be at liberty to produce these rules to the Home Office as their rules. What you say is before the masters have committed themselves to these rules to the extent of submitting them to the Home Office, that the men should have some voice in the matter ?—Yes, that is it, exactly.

20713. (*Mr. Smillie.*) In speaking with regard to fines, I take it you speak for Nottingham only ?—That is so.

20714. Upon all the other questions do you speak for Nottingham or on behalf of the Miners' Federation, which is wider ?—Well, I was appointed by the Federation.

Digitized by Google

Mr. J. G. Hancock.

30 May, 1907.

20715. You confine your evidence largely to your own county?—I can speak more confidently of my own county.

20716. May I take it that you have Special Rules applicable to your county, and that the majority of them are dealing with the safety of the workmen?—Yes.

20717. May I take it from you that the workmen have as much at stake in the mines of this country as the employer?—I think so.

20718. Upon that ground you are of opinion that they have an equal right to a voice in the establishment of Special Rules which are supposed to be for the safety of life and limb underground?—Yes.

20719. They have not generally, up to the present time, been taken into consideration in the establishment of Rules?—No.

20720. In the initial establishment of rules?—No, they have not.

20721. If it were agreed that the employers were entitled to initiate, in the first place, Special Rules which are supposed to be for the safety of the workmen, without the workmen having any voice in them, would not the workmen be as well entitled to initiate and send to the Home Office Special Rules they wish to have established?—Morally speaking, I think they would.

20722. The better way, you think, would be that they should be jointly, as far as they could agree, drawn up and sent to the Home Office?—I do.

20723. I think it is admitted that the timbering rules, initiated by the Home Office in the hope of improving the safety of life and limb underground, have not met with the success which was expected. That, I think, is the general opinion?—Yes.

20724. So far as accidents are concerned. Do you know whether that is so from your own experience; has there been any change?—I do not know that it is so from my own experience.

20725. Is it your opinion that any rule of such a nature would be more likely to be observed by the workmen if the workmen by their representatives were consulted in their establishment?—I think it would have a value then that it cannot possibly have if the workmen have not been consulted.

20726. Now, with regard to fines, one point has not been made clear to me. Do you know whether or not the workmen in other counties outside your own county are satisfied that there should be fines established in the collieries?—I cannot say.

20727. You do not know?—I do not know.

20728. Could you give us any idea of the seriousness of the breach of discipline or breach of a Special Rule which would be satisfied and met by a fine? Would you say a case of taking matches into a mine where naked lights were prohibited would be met by a fine?—I am not prepared to say it is.

20729. Or the opening of a safety lamp?—No.

20730. That would be too serious a matter to deal with by a fine?—I think so.

20731. Or any other breach of the Mines Act or Special Rules which seriously endangers the lives of the people generally underground?—I think there should be prosecutions.

20732. In a case of that kind?—Yes.

20733. No provision was made in the Mines Act for local fining by the employer for any breach of a Special Rule or of the Mines Act?—No, I think not.

20734. Was it not the intention of the Act that all breaches of rules should be punished by prosecution?—I cannot say that it is.

20735. There is no provision for any other kind of punishment?—No.

20736. If you are satisfied that a mere technical breach of a Special Rule or of the Mines Act should be dealt with by a fine mutually agreed upon, would you say the same thing with regard to a breach of the Mines Act by a certificated manager, that the mines inspector and he shall enter into an arrangement of fines rather than go into court?—I could not say that. That is a point that has never suggested itself to me.

20737. Would not the one be quite as just as the other? If it satisfies in the case of a miner would it not be quite as satisfactory in the case of a mine manager and a mines inspector?

(*Mr. Ratcliffe Ellis.*) A good deal more satisfactory to him than being brought before the magistrate.

20738-9. (*Mr. Smillie.*) I want to know whether you are prepared to admit such a dangerous thing as the inspectors dealing with the manager in that way?—I am not prepared to admit that. I can hardly put the manager in the position of the worker. I cannot understand a manager doing a thing that would, comparatively speaking, be of such small seriousness.

20740. Supposing you could imagine the inspector being entitled to fine a mine manager £1 rather than take him to court, do you think that would be as effective in securing the carrying out of the Mines Act as a prosecution would be?—I do not think it would be so effective. Prosecutions are more effective than fines in every case.

20741. In the case of managers and in the case of workmen too?—Yes.

20742. If you admit that it is more effective, why set up any other system which is less effective?—I cannot for the moment say that a man should be pulled before a bench of magistrates if he has improperly filled a tram. He may never have been into a court before in his life, and I will not say that man should be prosecuted if a fine of 2s. 6d would meet the case.

20743. That is hardly a breach of a Special Rule, or of the Mines Act?—The line should be drawn somewhere, I think.

20744. It is a very important question as to the extent of a fireman's duties. Do you agree that a fireman is the most important person, so far as the safety of the mine is concerned, who is engaged in the mines of this country?—A fireman may have 50 men under his control and their safety is continuously in his hands. He is one of the most important persons?—He is one of the important persons.

20745. You would not admit that he is the most important so far as safety is concerned?—I am not prepared to say he is not: I would not say he is.

20746. At least he is of sufficient importance to justify us in endeavouring to have the best possible men that can be got to occupy positions of that kind?—Yes.

20747. Is it your opinion that his attention should be directed entirely to looking after ventilation and the safety of the mine under his charge?—Yes, I do.

20748. Can he effectively carry out his duties in that respect if he is engaged on other duties such as laying and lifting of roadways or arranging for the getting out of the trams?—No, I do not think he can.

20749. That interferes very seriously with his usefulness so far as safety is concerned?—Yes.

20750. Is there any real difficulty in finding out whether or not a fireman really examines all the roadways. His statutory duties are to examine all the roadways leading to and from the working faces?—Yes.

20751. All the working faces and all the roads which may be traversed or travelled it is his duty to thoroughly examine to find out whether they are safe. Is there any real difficulty in a person going about mines knowing whether or not he does thoroughly examine all those roads?—No, the difficulty is here so far as I can see: the fireman cannot in many cases travel the allotted gates and faces in the time allowed him.

20752. In most cases is it not the fact that there are night shifts. Fairly generally there are night shifts?—I am speaking of the morning shift. I thought you were speaking of the morning shift.

20753. I am speaking of the morning examination, but very often there are men in the morning even when a fireman goes his round, is not that so?—Not generally in our district. Very often they go down at six and cease at two in the morning, in other cases they go down later and cease work at 5 or 5.30 in the morning.

20754. I want your own experience. Is it not fairly usual for firemen themselves to complain that it is impossible for them to go their rounds because of the extent of their district?—I have heard them make the admission that they could not travel the distance in the time allowed, that is to go in and out.

20755. Is it an understood fact in every mining district in a longwall working that a fireman goes right along the coal faces from one end to the other?—Yes.

20756. That is not a thorough examination?—That is not an examination according to the Act, in my opinion.

Digitized by Google

20757. It has been admitted that falls from sides and roof, haulage accidents, are the chief source of fatal accidents in mines ?—Yes.

20758. You were asked whether or not you would agree to making it a Special Rule that there should be a chain leading from one end of the train of tubs to the other in a haulage road. You said you were not prepared to go that length so far as the full tubs were concerned, but you would so far as the men riding in trams were concerned ? —Yes.

20759. That is for the safety of the men riding in the trams ?—Yes.

20760. Has not there been a considerable number of accidents by broken couplings and runaway trams, from a train of trams going up full ?—There have been in other districts, but I am not aware of any in ours. I cannot call any to mind and I have not the inspector's reports.

20761. You have a system of haulage in your district in which there is a large train of trams drawn by mechanical haulage ?—Yes.

20762. Sometimes up a considerable gradient ?—Yes.

20763. Are you aware the chains are used at the present time in your own county from one end to the other ?—Yes, and in other cases they are not used. Generally speaking the men are not allowed to travel those roads while the road is going.

20764. There are men to attend to the travelling road ? —Yes. *M. J. G. Hancock.* 30 May 1907.

20765. Would it be any serious hardship to make it compulsory upon the employer to have a chain over the top of every train of trams ?—I do not think it would.

(*Dr. Haldane.*) Is that a chain fixed to the end wagons ?

20766. (*Mr. Smillie.*) It is fixed to the rope on each end of a continuous haulage ?—In some cases they are underneath, in others they are what we call overhead.

20767. It does not interfere with the effectiveness of the haulage road ?—No.

20768. Would you be in favour of making it compulsory to have runaway points on all single haulage heading roads ? —The switches.

20769. Yes, runaway switchers so that if a breakaway takes place it would run off instead of down ?—Yes.

20770. You do not think that would be a serious inconvenience or danger ?—No ; in some cases they have appliances fixed in the roof, and at certain points in the road there is a handle, and from this handle to this piece of timber is a wire, and if people where this handle is know that a part of the train has broken loose they pull the handle and it drops a big piece of timber in the way.

THIRTY-SECOND DAY.

Tuesday, 11th June, 1907.

At Edinburgh.

PRESENT :

Lord MONKSWELL (*Chairman*).

Sir LINDSAY WOOD, Bart.
F. L. DAVIS, Esq.
THOMAS RATCLIFFE ELLIS, Esq.
JOHN SCOTT HALDANE, Esq., F.R.S.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. JOHN WEIR, called and examined.

STATEMENT OF WITNESS.

20771.—(1) In my opinion the staff of Government Inspectors is far from being adequate. There should be a sufficient number to overtake periodical inspection of every mine in the country. At present it appears that their time is mainly taken up in making inspections *after* accidents and attending enquiries. Inspections should be more directed with a view to the safety of mines and the prevention of accidents than is at present the case.

(2) *Inspection by workmen under General Rule* 38.—This rule is practically inoperative. The men do not take advantage of it, the chief cause of this being fear on the part of the men to give offence to the employers. Several of the miners' unions in Scotland encourage the men to make these inspections and pay for them out of their funds, but notwithstanding this there has been a reluctance on the part of the miners for years to take advantage of the rule.

(3) *Inspection by Officials under General Rule* 4.—This inspection is very inefficiently carried out. Many men who are appointed to make the inspection are not the most capable men for the purpose. Some indeed of the men appointed are incapable. In addition to this in many instances the area to be inspected can only be done in the most perfunctory way in the time allotted. Not only is this so, but generally it is only the working faces that are visited, the travelling roads being neglected altogether. Unless there is very apparent danger, under such a system there is little chance of notice being taken of it. *Mr. J. Weir.* 11 June 1907.

(4) *Discipline and its Enforcement.*—Discipline would be better ensured were a better class of under officials appointed under the management. I prefer prosecution to fining, as a means of its enforcement, although I believe the men themselves would seriously object.

(5) *Special Rules.*—The present system of establishing Special Rules should be amended to give the workmen's representatives an opportunity of putting forth their views in some effective manner. Special Rules, when once established in a district, should apply at once to all new mines subsequently opened.

(6) *Falls of Roof and Side.*—A systematic method of timbering should be rigidly enforced, a system to be adopted most suitable to the seam worked. In view of the failure of the recent timbering rules I would suggest that there be a reasonable body of men either for the purpose of putting up the timber, or a district allotted to each of these men where each could almost continually supervise the men on their timbering operations.

(7) *Haulage.*—Haulage accidents in my view would be greatly diminished were one side of the road sufficiently

Mr. J. Weir.

11 June 1907

wide from the rails so as to enable the men to stand clear of the running hutches, in addition to the usual manholes. In Fife there are a great many wheel braes not only for sections of men being served taking away the output—but there are single places which use wheels and also what is known as cut chain braes. These arrangements necessarily increase the chances of haulage accidents. In many of these inclines there should be specially constructed bogies to take in prop wood, especially if it is of any length. At the foot of all wheel braes if "pointers" were provided many accidents to "hangers-on" would be prevented. There should also be a specific height for main haulage roads. In the case of incline planes which are meant to be self-acting, it ought to be made compulsory that the gradient should be so arranged, that no assistance either from top or bottom by pushing hutches, should be required, and mechanical means employed to prevent runaways as far as possible.

(8) *Shaft.*—While men are riding in the shaft, the cages should have either gates or bars. I have seen this in operation in Belgium.

(9) *Safety Lamps.*—Safety lamps should be introduced into all mines where a Government Inspector thinks there is the slightest danger of an explosion.

(10) *Investigation into Accidents.*—Under ordinary circumstances the present system of investigation in Scotland, having been recently improved, is fairly good. Where, however, a serious accident has occurred and where there may be doubt as to the searching character of the enquiry, it should be open to those interested to claim and obtain a fresh enquiry.

(11) *Ankylostomiasis.*—Something should be done with a view of enforcing great care as to the employment of foreign workmen, or men who have been employed in foreign countries, especially from countries where disease is known to exist. Improved sanitation in mines is absolutely necessary as a further precaution.

20771A. (*Mr. Smillie.*) You are Secretary of the Fife and Kinross Miners' Association?—I am.

20772. Have you had considerable experience as a working miner and an official of the miners?—That is so. I have been for nearly 27 years secretary to the Fife Miners' Association, and I was actively engaged in the mines for about 17 years prior to that.

20773. Have you taken an active interest in all mining legislation during the past 25 or 30 years?—I have.

20774. Have you attended all the principal conferences which have been held to deal with questions of that kind?—I have.

20775. I suppose you are aware that for a considerable time past there has been a desire on the part of the organised miners of the country for improved legislation?—That is so.

20776. Is there a strong feeling that the safety of underground workers is not so well looked after now as it might be?—That is the impression we have.

20777. You are aware that the proposed Coal Mines Bill has been promoted by the Miners' Federation of Great Britain?—Yes.

20778. I want you to deal with one or two of the points which the miners propose in the direction of legislation. Are you well aware of the present system of Government inspection in mines?—Yes.

20779. Are you aware that for East and West Scotland we have two chief inspectors and four assistants?—That is so.

20780. Are you of opinion that the Government inspection, as it exists to-day, is effective?—I consider it as being far from efficient.

20781. Have you any opinion as to the methods pursued at the present time? Are inspections of the mines frequently made?—They are not, so far as my knowledge goes. My understanding with reference to these inspections is that they are generally made after an accident, or upon a complaint being made to the inspector.

20782. So far as you are aware there is no system of regular inspection of the mines made monthly, half-yearly, or even annually?—I am not aware of any.

20783. Is it your opinion that there should be an increase in the staff of inspectors?—Decidedly.

20784. Have you any opinion as to the additional number which would be necessary?—Under our Bill we desire one for each 10,000 men employed in or about the mine. Personally, I think that is scarcely sufficient, and that there should be more.

20785. You think that one for each 10,000 persons employed in or about the mines in Great Britain would no be enough for an effective and efficient inspection?—I think not.

20786. Have you considered the matter, and can you say how many you think would be necessary?—I should be inclined to follow the lines of the French system. They have an inspector for every 2,000 persons employed, which I think is not over-much.

20787. As to the method of appointing, do you approve the French system which, I understand, gives the workmen in the locality the right to appoint?—I quite approve of it.

20788. And of course that they should be paid, as the present inspectors are paid, by the Government?—Yes.

20789. Have you any suggestion to make as to the qualifications necessary for assistant inspectors proposed by the Miners' Federation?—We consider that additional inspectors appointed should be drawn from practical men who hold certificates of competency either of the first or second class.

20790. (*Mr. Ratcliffe Ellis.*) Do you think second class would be sufficient?—Either first or second class. We have many men working at the coal face just now who hold first-class certificates, and they would be, I think, quite competent to take up duties of that kind.

20791. (*Mr. Smillie.*) You would not object to its being limited to persons holding first-class certificates?—I would not object at all.

20792. But you are strongly of opinion that they should be persons who hold certificates which would show that they had a considerable amount of practical experience?—Yes, a good deal of practical experience, say, at least five years' experience, or more.

20793. Are you of opinion that persons who have had that experience are more likely to make efficient inspections than the present class of inspectors?—I think they are. They are more accustomed to that kind of work; that is to say, they are more accustomed to the mining work, and I think they would take more readily to it.

20794. I believe you have no complaint to make of our present inspectors other than it is physically impossible for them to make the inspection which you desire?—I have no complaint to make of them at all; but from our experience we know that it is practically impossible for them to make the inspections such as we should like to see.

20795. Are you of opinion that our present system of mines inspection, limited though it is, tends to the safety of the miners?—It is bound to have a tendency in that direction. If you were to withdraw the inspection it would make a great difference, in my opinion, because it would increase the laxity of the managers a great deal.

20796. The expectation which now exists of a surprise visit on the part of inspectors tends to make managers more careful than they otherwise would be?—That is so.

20797. We may take it there are a few managers whose chief desire is to obtain large outputs, and they are less careful with the lives of the men than they otherwise might be?—My view is that the main object to the manager is to produce a large output, no matter how it is obtained.

20798. And sometimes even the Mines Act is to some extent neglected in order to secure that?—I would not like to go that far, but we have a suspicion in that direction that it is not so carefully observed in order to secure the end they have in view.

20799. Would you propose that the additional inspectors if appointed should be responsible to the chief inspector?—Certainly; you must have someone to control them.

20800. Would you propose to confine them to a particular district, or to place them, as they are now, under the inspector to be sent to any district he might care to send them to?—I think it might be well that he chief inspector should have the control of these additional inspectors, have power to send them where he thinks they will be most useful, and not limit them to any particular area.

20801. You are well aware that under Rule 38 the miners have at present the right to appoint two of their number who are practical miners to make inspections once a month?—I am aware of that rule.

20802. Is it taken advantage of at the present time?—It is not taken advantage of at all scarcely in our district. The last inspection that was made in my district was in July, 1899, I think, and for several years before that there were no inspections made.

20803. May we take it from that circumstance there is no

Digitized by Google

occasion for inspection in our district ?—There is a good deal of occasion for it in my view ; but the reason why the men do not take advantage of that rule is that they are afraid of giving offence to the employers, and when the inspections were made there was very seldom any defect disclosed through these inspections which caused the men who appointed the inspectors to get the notion that it was useless to continue it because there were no practical results in their view. I think that is an additional reason why the inspections are not taken advantage of. I consider that men appointed for that purpose should be entirely outside the influence of any employer and free to give an unbiassed and fair opinion as to how they find the condition of the mine. We have always contended that we should have the privilege that we fought for in 1887 when the Act was passed, and that the clause should contain the words, "Miners who are, or have been, employed in the mine should be eligible for making the inspections." The words "have been" were struck out in the House of Lords that year, and we have been left practically in the same position as we were prior to the passing of that Act, on this particular point, only with this advantage that we could select our men from different collieries to go and inspect others.

20804. (*Chairman.*) You can do so now ?—Yes.

20805. (*Mr. Smillie.*) But they must be working miners at the time of their selection ?—They must be working miners at the time of their appointment.

20806 You are of opinion that this Rule will not be taken advantage of, or, if it is taken advantage of, the inspection will not be so effective as it might be, unless you have the power to appoint persons who are not in fear of the influence of the employer ?—That is my view.

20807. It would be taken advantage of more frequently if that were so ?—I am certain it would. We proposed in our district that we should have the power to appoint men who should go over the whole of our county, but we discovered that that would not conform with the rule, because it was held that after they were engaged to make an inspection at one of our collieries they would not be eligible to make an inspection at another, as, being engaged in making an inspection at the colliery, they would not be then practical working miners and eligible to go down and inspect another colliery.

20808-9. (*Chairman.*) You mean that the mere fact that a working miner had been down another mine for purposes of inspection would take him out of the category of a working miner ?—That is what we understood.

20810. Your recollection is that the clause was as you wanted it to be in the House of Commons, but those words "have been" were struck out in the House of Lords ?—That is my recollection.

20811. (*Mr. Smillie.*) You understand that the reason for the words "not being mining engineers" being put in by the employers was to prevent persons who might be interested seeing their mines ? Have you any objection to the words "not being mining engineers" ?—I have no objection to that.

20812. You would be satisfied if this clause read : "who are or have been" ?—Yes.

20813. That would give you an opportunity which you do not now possess of appointing from the workmen and paying men to make a periodical examination in the district ?—Yes.

20814. There is no difficulty in your district, or Scotland generally, about payment for this work ?—None whatever. We have for many years had a standing order in our Union that if a district applies to the General Secretary for an inspection of that kind to be made, the Union pays all the expenses connected with the inspection ; but notwithstanding there is no difficulty about the payment, the men seem not to take advantage of it.

20815. Is it, so far as you know, a fact that it is because of the hard work it involves that the men have been prevented from undertaking it ?—I have never heard that stated myself.

20816. Do you think that any person has refused to make an inspection on that ground ?—It might be possible for someone to have done so, because if you take a man away from his work he may think it will be harder for him to return to his work in consequence of what may have occurred while he is away, but it is not harder work than working at the face.

20817. You think that the appointment of two men would prevent that ?—That is so.

20818. Now come to the question of the appointment of firemen to make an inspection in the morning. Are you satisfied with the present position of matters as to the appointment of firemen, and their qualifications generally ?—I am not.

20819. Do you think it necessary there should be some examination and certificate of competency for men holding that position ?—I think there should be, because I consider the fireman one of the most important officials in a colliery.

20820. And that applies especially where there are dangers arising from accumulations of gas ?—Undoubtedly,

20821. The fireman cannot possibly efficiently look after the safety of the mine under his charge unless he is a thoroughly practical miner ?—That is my opinion. He ought to be a thoroughly practical man, and there ought to be some examination, so that we should have confidence in him.

20822. And if he was a practical miner it would be all the better if he had some theoretical knowledge of gases and ventilation ?—Undoubtedly.

20823. So that you are favourable to certificates of competency being granted to firemen ?—I am, and that has grown on me recently from what has come to my knowledge. In recent fatal accident inquiries, upon the examination of firemen, they have confessed in the witness-box that they did not even know the rules—one of them, at least, did not know the rules—applicable to their duties. and they had not read them. Another one whom I examined myself confessed to tapping a stone with his knuckles instead of using a hammer or a pick in order to discover whether or not the stone which caused the accident was loose. That, I think, is rather an extraordinary condition of things to exist, and ought to be prevented by some method of examination to ascertain whether the men are competent or not.

20824. At the present time it depends entirely on the managers, who are supposed under the Act to appoint competent persons ?—Yes.

20825. A manager may appoint some person who is admittedly not competent, merely through favour ?—That is so. Of course I cannot speak to any particular case further than what I have known myself and what I have spoken of here, but men have evidently been appointed not because they were competent, but from some other cause. We have it frequently reported from the collieries that men are appointed with very little experience, and men coming from other trades have, after the lapse of a short time, been appointed to that important position. Further, we have these men at several collieries, not all, and I do not think the majority, paid less wages than the working miner, which, as you will observe, cannot attract men with practical knowledge.

20826. One of the Scotch inspectors, I think, complained of the remuneration paid to those men, and said the wages paid to them did not attract the best class of men. You agree that at some collieries in your county that is so ?—We have them paid as low as 5s. 3½d., 5s. 4d., 6s., and 6s. 4d., whereas a competent miner just now can make 6s. 6d. or 6s. 9d. easily.

20827. You think a competent miner is not likely to take the important position of fireman at a reduced rate of payment ?—Certainly not, plus the responsibility to the fireman.

20828. That may have something to do with the appointment of men in some cases who are not as highly qualified as they might be ?—Certainly. I believe that some of the men appointed do not understand the responsibilities attached to the position.

20829. Have you any personal knowledge of the extent of the district which the firemen in your district are supposed to examine ?—I have no personal knowledge, but when I was working in a mine about 30 years ago it was quite the common practice that a pretty long stretch of longwall was allotted to one man, and he went down perhaps an hour and a half or two hours before the shift began, and the firemen themselves confessed that they did nothing else but went round the faces, made a cursory examination, put a chalk mark on each face, and that constituted the inspection ; and according to the information I can obtain now from any of the representative men at the collieries, I gather that is practically what is in existence to-day. The men do not go out and in the roads as is required by the rule.

20830. (*Dr. Haldane.*) They simply go along the face, without examining each road ?—Yes.

20831. (*Mr. Smillie.*) You are aware that they are supposed to examine every roadway which the men are likely or expected to travel ?—That is the law.

Digitized by Google

Mr. J. Weir.
11 June 1907

20832. It is your opinion that that law is not carried out, and that it is physically impossible for the firemen to do it at the present time?—That is my impression.

20833. Because of the extent of the district?—Because they cannot do it; and I do not think the management insists on their doing it.

20834. (*Chairman.*) Is there any system by which you can tell whether a man has examined a road or not? Is he ever obliged to put a chalk mark at the end to show he has been down that particular road?—There is no particular method by which you can detect it that I am aware of—he only chalks the face.

20835. Suppose it was obligatory upon him to chalk some other part of the roadway to show he had been down there?—That would be an additional method of detecting whether he had been there or not.

20836. But at the present time there are absolutely no means of finding out whether a man has been down a roadway or not?—There are no means of detecting it in the way you indicate.

20837. (*Mr. Smillie.*) If it were compulsory that he should put the day of the month on each face midway between the head of the face and the roadway, that would make it necessary he should visit each roadway in order to do so?—If he was bound to put a chalk mark at the beginning of the road where he should enter, and again in the centre and at the end, that would enable you to detect it; but if he has only to put a chalk mark at the entrance, then he can put it there and pass on to another, and so pass round the faces.

20838. The chief point is that, so far as your own personal knowledge goes, and what you have heard from your own people, the districts are so large that it is impossible to do that at the present time?—The reports we get indicate that clearly.

20839. (*Chairman.*) I understand you to say on the first inspection he has not time to do it?—Just so.

20840. I understand on the second inspection the fireman might have time to do it?—Yes; he is not then limited to two hours.

20841. (*Mr. Smillie.*) He is limited on his first inspection to two hours?—Yes.

20842. (*Chairman.*) On his second inspection he may take as long as he likes about it, and if he chooses on the second inspection he can go down the roads?—That is so.

20843. You think as a general rule he does not?—As a general rule I think he does not. That is my impression, but I have no proof of it, however.

20844. (*Mr. Smillie.*) If the whole of the time of the fireman was devoted to the examination of the working faces and the ventilation, there would be time for making a thorough examination on the second inspection?—Undoubtedly.

20845. Is the whole time of your firemen in Fife, and Scotland generally so far as you know, devoted to looking after the ventilation and the roof of the pit and the working faces?—No. I have myself heard the firemen state that they have other duties to perform, such as clearing roads and putting up timber where repairs were needed.

20846. And sometimes they have to do with getting the output?—Regulating the trams and keeping the drawers going properly, the pony drivers, and so on, and seeing the work goes on regularly. That is part of the duty so far as my impression goes.

20847. Is it the opinion of the miners that the firemen's duties should be confined to looking after the safety of the working, the ventilation, the roof and sides, and so on?—That is so, and I think that should be so.

20848. Do you think that if that were made general in the country there would be fewer accidents than there are at the present time?—If that were rightly enforced I think it would have the tendency to decrease accidents.

20849. Let me ask you about the timbering. You are aware of course that a very large proportion of the accidents arise from falls of roof and sides. Are you satisfied with the present system of timbering?—I am not satisfied. I think there could be an improvement. When the systematic timbering was enforced, by the recently adopted Rules, I expected that there would be an improvement as to accidents from roof falls, but unfortunately that has not been so. However, I have not lost faith in it. My view is that there should be a special class of men either set aside for the purpose of doing timbering, or seeing that it is thoroughly done, each man should have a certain district allotted to him to supervise, and that district should not be too large.

20850. Either to put up the timbering or to see that the men working at the face put it up in a position which gave the greatest safety?—That is so.

20851. You are aware I suppose that a considerable amount of carelessness exists at the present time amongst certain classes of the workmen at the face?—Undoubtedly a good deal of carelessness and a good deal of incompetency.

20852. The two things, incompetency and carelessness?—Yes.

20853. And to some extent that arises from the fact that the men are paid by piecework, and sometimes take risks that they would not otherwise take?—I am sure of that. Occasionally a man will, in order to get a certain bit of work done expeditiously, run a little risk, seeing that his wages depend upon his getting it done as expeditiously as possible.

20854. Then there are three main causes, you think, for accidents from falls at the face; incompetency, carelessness and the risk which men sometimes run in order to get a certain piece of work done. You think those are the three main causes of accidents at the face?—Well, they are three causes.

20855. Of course there are accidents which will arise in spite of every precaution?—Yes; pure accidents will occur.

20856. You think that by having men specially appointed either to do the timbering or supervise its being done, many accidents which now occur would be prevented?—I have a strong belief that there would be a great improvement if that were done, and it would tend very materially to reduce accidents from roof falls.

20857. (*Dr. Haldane.*) Do you mean a special class of official in addition to the fireman, or that the fireman should supervise the timbering?—If there were a special class of men for that particular purpose there would not be so much necessity for the fireman making either one or two inspections, because they could take that responsibility But my view is that the particular duty of these men should be to see that the timbering is properly set, because I look upon that as being all-important for safety.

20858. (*Mr. Smillie.*) And that would be the duty of the fireman if his district was small enough to enable him to do it, in addition to looking after the ventilation?—Yes.

20859. (*Sir Lindsay Wood.*) Should the person whom you appoint—the deputy or timberman—set the timber, or merely supervise its being set?—My suggestion is alternative; he could either do one or the other. If it was considered desirable—and I think it is most desirable—that he should set the timber, that should be adopted; but if there was too much opposition to a proposal of that kind, I think that he should thoroughly and closely supervise it.

20860. He should see that the men do it?—That the men do it—because I am free to confess that there is still a lingering feeling, among the old Scotch miners particularly, that they are the best men to set the timber in the working faces, because they are always there. You might have opposition from that source, but I think there should be thorough supervision of that.

20861. (*Mr. Smillie.*) Now I will ask you about the haulage accidents. You are aware that a very considerable number of fatal and serious accidents arise from haulage?—Yes, that is a very prolific source of accidents.

20862. Do you think it is safe to have a haulage road and at the same time a travelling road—I mean, to allow the haulage road to be used as a travelling road?—I would prefer there should not be any travelling on the haulage road; but if it was impracticable to have that, then I think there should be sufficient width between the rails and the sides of the road that the men would be able to walk absolutely clear of the hutches running, and possibly having manholes on the same side, in case of runaways, or anything of that sort.

20863. You suggest that where haulage roads are used as travelling roads there should be at all times sufficient room between the rails and the side to enable men to pass and repass for travelling purposes?—That is so, on one side.

20864. In addition to that, you think it would be necessary to have the manholes which are compulsory at the present time?—I think they should not be done away with, even supposing that width was provided.

20865. Would you suggest that it should be compulsory that all manholes should be periodically whitewashed?—I think so. These manholes ought to be made as easily

Digitized by Google

discernible as possible, and if whitewashed it would help very materially in my opinion.

20866. Do you know of any system at the present time in force to prevent runaway trams or hutches, where the haulage is done in trains or rakes, causing accidents in the event of a coupling or drawbar breaking ?—I do not know of any system in our district which has been adopted specially; but we are continually advocating in our district that there should be what is termed a safety-chain either below or above the rake of hutches, so that if the coupling gives way this chain comes into action and so prevents an accident.

20867. That is a chain attachable at either end to the rope ?—Yes.

20868. Or, where it is a single road, attachable to the last hutch and the rope at the other end ?—Yes.

20869. There have been serious accidents arising from such breaks ?—Yes, there have been accidents from that cause.

20870. Would you be in favour of having runaway points or slip rails or single haulage roads, so that in the event of a rope breaking the hutches would be thrown off the road before they could be run far down ?—I think that would be an excellent thing if it could be put into operation.

20871. Now as to the question of colliery enginemen. Are you aware that during the past 20 years the number of men allowed to ride in cages in large collieries has considerably increased ?—That is so.

20872. I think it is admitted that there is a greater strain on engine-winders to-day, because of the largely increased output, than there was some years ago. I want your opinion about that ?—That is undoubted.

20873. (*Sir Lindsay Wood.*) In Scotland ?—In Scotland.

20874. (*Mr. Smillie.*) In consequence of the output having largely increased at the larger collieries there is a greater strain on the engine-winders now than there was some years ago at the smaller collieries ?—That is so.

20875. At the present time, in many of the large collieries in Scotland, the engine-winder is from eight to ten hours at his engine handle with a break of from 15 to 20 minutes ?—In our particular district I think it runs from 20 minutes to half an hour during his winding time. I should say he is there about nine hours, because it includes the winding of men and coal.

20876. And he has not half a minute's rest during that time except the 20 minutes' break ?—That is so. At one of our collieries which I had in my mind just now the engineman has not a minute, but is continuously winding.

20877. I believe you have no fault to find with the class of men who are enginemen generally all over the country ?—They are a pretty good class of men so far as my knowledge goes.

20878. Steady and temperate and skilled in their particular employment ?—That is so.

20879. But there are accidents arising sometimes from a sudden weakness—heart affection or something of that sort suddenly overcoming the engine-winder ?—I have not had experience in our district of a case from that particular cause, but I have heard of it. I can quite conceive it possible that a man may get suddenly ill and be incapable of attending to his engine when the men are riding in the shaft and I have always held that, during the time when the men are being drawn up or lowered, there should be two men at the engine handle, so that there should be no accident of that kind.

20880. Would you be favourable to the engine-winders holding a certificate of competency ?—I should.

20881. Do you think that is necessary ?—I think it would be a guarantee of his competency, the same as I would insist upon a manager having a certificate, or a fireman having a certificate.

20882. Is that your opinion that an engine-winder should have no other work to do but to attend to his engine ?—I think so.

20883. At the present time he is not confined absolutely to that ?—I understand his duties include attending to the boilers as well which may take him away from his handle—that is, to go out of the engine room and see that the boiler is all right. I do not mean to say that it is the case in places where there is continuous winding, because that is not possible, but one instance occurs to me just now where an engineman has to go and fire his engine such as I have seen in my younger days where the output was small.

20884. (*Mr. Ratcliffe Ellis.*) But there have been improvements during the last 30 years, Mr. Weir ?—Yes, there have been great improvements in that sort of thing since I was working in a mine.

20885. (*Mr. Smillie.*) Have you a large number of unskilled workmen in the mines in Fife ?—I think we have a good few. We have importations from other districts which seem to be getting more numerous than ever. A very interesting census was taken by one of our managers a few months ago of that particular matter.

20886. (*Mr. Ratcliffe Ellis.*) Was that the census which was put before the Eight Hours Committee ?—Yes; that was very interesting. He employed 1,398 men, and out of that number 450 were drawn from other trades and occupations, so that that was about one-third of the people employed—a large percentage. The rest of the men employed in that mine were those who, on leaving school, had started to work in the mines.

20887. (*Mr. Smillie.*) And those 450 had entered the mine at various stages ?—That is so. I do not mean to say that those men would all be employed at the face.

20888. Are there any figures given as to the number employed at the coal face ?—No, there is no indication of that.

20889. You are aware that there is a Rule in the Mines Act which is supposed to prohibit the employment of any person at the coal face who has not previously had two years' practical experience under a practical miner ?—Yes.

20890. Is that Rule generally carried out in Scotland ?—I cannot say. We try to insist upon it, but we cannot tell whether it is carried out or not. We have no way of detecting it.

20891. Do you think it is a wise provision ?—I think it is, and we fought for it in the House of Commons.

20892. In the interests of safety ?—Yes, in the interests of safety.

20893. If it is wise to prevent an unskilled person working alone at the coal face, would it be intelligent to allow three or four or more unskilled persons to work together ?—That is only increasing the evil. I think it would be a most dangerous thing to do that.

(*Chairman.*) Do I understand that your objection is to unskilled persons working at the face at all, or only to working without any skilled supervision ? Supposing you have a skilled man supervising two unskilled workmen at the face, is that what you would consider safe ?

(*Mr. Smillie.*) We have no objection to unskilled persons at the face if under the supervision of a skilled person, but it lends itself to this: we have cases where there are 12 or 14 foreign workmen at the working face under the charge of one person. You will have evidence of that.

(*Chairman.*) What would you consider would be a reasonable proportion ?

(*Mr. Smillie.*) We do not object to one skilled person taking one unskilled man with him to learn.

(*Witness.*) I think one unskilled person in a working face is quite sufficient to look after.

20894. In the Scotch mines we have a different system from what exists in England. It is largely the practice in Scotland for the lads to go to the working face with their fathers when they leave school ?—That is so. That is quite a common thing.

20895. We call a skilled Scotch miner a person who has been brought up at the colliery from 13 or 14 years of age ?—That is how it is looked upon.

20896. That is pretty generally the case ?—Yes. At our collieries the young people go in with their fathers and gradually learn to become miners. They also go with other men as well, not only their fathers.

20897. (*Sir Lindsay Wood.*) You say that there are only two District Inspectors in Scotland and four Assistant Inspectors ?—Yes, that is so.

20898. Do you know what number of men they have under them ?—I think they have about 127,455, including quarries.

20899. Do you think that the district is too large for so few inspectors ?—Yes, I think so.

20900. Would you advise the districts being divided and having more District Inspectors ?—I have never applied my

Digitized by Google

Mr. J. Weir. 11 June 1907

mind to that point. What we aim at is to have an increased staff of Inspectors who will be subject to these two. I have never thought of dividing Scotland up into any smaller districts than what they are now.

20901. Do you think it would be an advantage to have more District Inspectors?—I do not say that it would be a disadvantage. For example, if we had a staff for Fife only, which is now getting a large colliery, it would be easy to get at the collieries instead of their living away from the colliery, and it requiring some time before it can be reached; I think that would be a good thing.

20902. You recommend one Inspector for every 10,000 men?—For even less than 10,000 men. That is what our Bill is.

20903. That would mean that you would require a great increase in their number?—We should require double the staff that we have now.

20904. You would require more than that. You have six now, altogether?

(*Mr. Smillie.*) We have only six for every 127,500.

(*Witness.*) We should require fully double the number.

20905. (*Sir Lindsay Wood.*) How long an interval would be required to get round the mines if the inspections were made as you deem they should be made?—I could not form an estimate of that. The Government Inspectors would be the best parties to give you some indication as to that, but judging by the inspection that is made now, when they can only make an inspection once a year of every colliery, and that a very incomplete one, it seems to me, by doubling the inspectorate, that you could not get them to make the inspection once in six months sufficiently.

20906. Not if their whole time is occupied now. That is a matter of arithmetic?—Precisely.

20907. I understand that you want to have these inspections made much more frequently than once in six months?—I would be satisfied if there was a fixture for making them at least once in six months, and, in cases of emergency, I think it is desirable that they should be made between those periods.

20908. That would not be examining the places throughout the whole of the mine. That would only be doing the work which they are practically doing now?—That would be a considerable improvement upon the present system, of course, and it remains to be seen whether that would be efficient.

20909. You say that Rule 38 has not been acted upon in Scotland?—Very little.

20910. What is the real reason for that?—I explained to Mr. Smillie that fear of giving offence to the employer was one reason. The men do not care to go into the mine of their employer and make a report that he might feel offended at, especially if they found any defects. The other reason I gave Mr. Smillie was that in the past, when these reports have been made, so seldom has a defect been commented upon, the idea has got abroad that there is no use in having the inspection made, seeing that there is no practical result.

20911. In some districts they do make these inspections?—I heard recently that they were making them in Lanarkshire.

20912. I mean throughout England, not Scotland?—I do not know what they do in England.

20913. We do not find that there is any conflict between the Managers and the men where they do make them?—I cannot speak of these districts, and I am not aware of anything arising out of them.

20914. You cannot give us any experience of these inspections under Rule 38?—Not so far as England is concerned.

20915. Nor Scotland, because you say that you have never had any made?—I said the last that we had in our district was in 1899.

20916. That is practically none?—Well, that is so. I may mention that when that inspection was made it was reported to us that the mine was in a very bad condition both as to the ventilation and as to general safety, and the parties who made the complaint were eventually appointed to make that inspection, which took some four or five days to accomplish, with the result that a most favourable report was made as to the condition of the mine. That gave rise to the notion among the men who appointed them that they had not efficiently examined the mine or given a fair or proper report.

20917. (*Mr. Ratcliffe Ellis.*) Who made that inspection?—Two of the workmen.

20918. At the mine?—Yes. The men who made the complaint were men who were working in the mine, and they were the men who were appointed. The two chief complainers were the men appointed to make the inspection.

20919. (*Mr. Smillie.*) And they found everything was all right?—Yes.

20920. (*Dr. Haldane.*) Was there any good reason for believing that there was anything wrong?—They made plenty of noise about it beforehand; I do not know. It is rather strange that everything was right after they had such a strong complaint to make about it a few weeks before.

20921. (*Sir Lindsay Wood.*) Under Rule 38 it seems to me that you get the men most acquainted with the colliery, and those men ought to know the defects of the colliery, to make the report rather than outside men?—I understand that they are the men employed at the colliery and most acquainted with it.

20922. If you want to have more inspectors appointed, why do you not take advantage of the rule which gives power to inspect?—We want more inspection paid for by the Government. Having had the experience that we have had of Rule 38 we think it is now obsolete, and that something better should take its place.

20923. It cannot be obsolete if you do not act upon it; in fact you have hardly tried it—It has lapsed; it has gone into disuse, practically.

20924. Then with regard to the appointment of firemen, you think that they ought to have a certificate?—Yes, I think so.

20925. Do you think that in Scotland that they are not appointed from the best men?—I am certain that they are not.

20926. It must be a matter of judgment, because surely the manager appoints the best men he can get?—I have given you two cases which have come under my personal knowledge, which clearly prove that they are not the best men who have been appointed.

20927. There are certain to be exceptions to every rule, but do you say that of the whole number which you must have in Scotland?—I do not mean to say that they are all the worst men that are appointed, but as a general rule I do not think that the situation of fireman is made as attractive as it ought to be; I mean with regard to remuneration and other things, so that it would draw the best class of men to apply for such jobs.

20928. Does not the example you gave of the fireman being underpaid as compared with the hewer apply more to where the wages of the hewer are extra high?—I do not think it does; I think it applies even when the wages are what may be termed at an ordinary point.

20929. Is the ordinary standard wage for firemen less than for hewers?—Yes, in some places.

20930. Is it so in many places?—I would not like to say a great many.

20931. Is it not the general practice that they are paid higher?—I do not think so.

20932. In Scotland?—Not in my experience.

20933. (*Mr. Smillie.*) Is it not universal that they are paid lower?—That is so.

20934. That is universal, all over Scotland?—No, I would not say universal. I know that some are paid 6s. 6d. a day in our own county.

(*Mr. Smillie.*) Hewers are earning more than that.

(*Sir Lindsay Wood.*) Is the normal wage of the hewer more than 6s. 6d. a day?

(*Mr. Smillie.*) The fireman's wage falls and rises with the hewers, so that keeps them in the same position.

20935. (*Sir Lindsay Wood.*) You think that they ought to pass an examination?—Yes, I think so. I would not make it a very stiff examination, but I think that they ought to pass some kind of examination. I think that it would be conducive to safety, and the passing of an examination would also give confidence to the men in the discharge of their duties. I also think that it would add to their efficiency, as it would enforce dis ipline in the mines. The men would respect them more, and they would take their word more readily if they were looked upon as being a class of superior workmen.

20936. In Scotland you say that the firemen are used by the owners for getting the coal away. To what extent is that done ?—It is quite common for the firemen to look after the tubs and trams in order to see that they are kept going regularly, and if there is any hitch in that department he is supposed to have it put right and get matters put in order again.

20937. That would be in the working faces ?—No, on the roads.

20938. Do you mean the main haulage roads ?—The haulage roads and pony roads, and drawing roads and sidings.

20939. You mean up to the hauling station, not on the main haulage road going to the shaft ?—In a general way he would overlook all that was within his district.

20940. The meaning of that is that his whole time is not occupied at the face of the workings ?—Certainly not.

20941. It is the practice in Scotland for the men to set the timber ?—That is so.

20942. The fireman does not interfere with it, excepting when he sees that it is wrong ?—Where he sees that the men are not timbering their places as they ought to, or according to the rule laid down, he instructs them to put them right.

20943. He does not do it himself ?—No.

20944. Do you think that he ought to do it ?—I did not say that the fireman ought to do it, because that would increase his duties as a fireman ; but if there was a special staff of workmen appointed for that purpose they should do that, with a district allotted to them, as I have stated.

20945. A special staff of men to do nothing but the timbering ?—Yes.

20946. In that event you would still require the hewer and the man at the face to set his own timber to protect himself if something occurred while the deputy was not there ?—Certainly. Common sense dictates that a man would look after his own head and safety.

20947. It does not always do that ?—Well, I expect it should do.

20948. With respect to haulage, have you many mines in Scotland where there are separate travelling roads ?—No, I do not think that we have many ; I do not know of any in our district.

20949. Are they old mines ?—We have old mines and very modern mines, too.

20950. Have you many heavy incline engine haulage roads ?—Yes.

20951. Are they on the level ?—No, they are inclined.

20952. Both from the shaft and to the shaft ?—Yes.

20953. Have you many accidents upon these ?—We have a good many haulage accidents in Fife. I think that we have a full share of the haulage accidents, for this reason : we have considerably deep workings. The wheel braes are numerous, which lends itself to considerably increased chances of accidents, and I think that they produce as many of these accidents as any county ; I mean in proportion to its size. We have them driving to the rise one single drift going where these wheels are absolutely necessary owing to the steepness, and they shift it from time to time as the workings recede.

20954. That system is rather more dangerous than ponies ?—Yes.

20955. That is the reason that you get more accidents ?—Yes. In connection with these braes where accidents have occurred they have arisen in this way : the boy or man at the bottom of these braes, particularly these single braes where they supply one face, does not take the trouble to put mouth plates or pointers at the bottom, but just have the rails squarely set, and the party at the foot of the brae has to watch when they start the wheel to guide these empty hutches on to the rails, and when a runaway takes place if the man at the bottom forgets anything, that is to say forgets to couple his hutch on, this hutch comes down like a shot, and we have had several fatal accidents in consequence of that, whereas if these pointers were on, it would require the man to put the hutch there and couple it on and withdraw it, and it would take the rails itself. I think that should be made compulsory.

20956. It would be a very difficult provision to put into an Act of Parliament, but I should think that every mining engineer would do it for his own good ?—It is a very simple thing and gives the man an opportunity of withdrawing out of danger.

20957. Do you think that many accidents occur in consequence of this ?—We have had one or two accidents purely on account of that.

20958. You do not have endless ropes ; I suppose it is too steep ?—I do not know of any endless ropes in Fife.

20959. They are only used on the flat ?—Yes.

20960. There are much less accidents with them because they go slowly ?—I should fancy that they were not so liable to accidents on flat workings.

20961. I think you recommend that there should be some shortening in the hours of the winding enginemen ?—I think that the enginemen should not be engaged more than 8 hours at the very most.

20962. You do not have many accidents in your district ?—We have many winding accidents. We have had one quite recently which resulted fatally, caused by a bit of wood going down the shaft and killing a man in the shaft. That happened with a young engineman.

20963. I see by the Return that there are only three fatal accidents and four men killed in 10 years from overwinding ?—In Scotland ?

20964. Yes.—This accident happened last year or the beginning of this year, but I could not exactly fix the date.

20965. There is not much room for improvement ; there are other places where we get more. Do you say that the engineman went away to fire his boilers ?—No ; that used to be the custom when the output was very small ; he attended to the firing of the boilers as well as attending to the engine, but where the output is large that is not possible. He has, however, sometimes to go out of his engine on to the top of the boiler to see how the boilers are keeping, to see to the feeding and what not.

20966. His attention cannot be constant during the time that he is away ?—That is so. I think that an engineman should be entirely confined to the winding of the engine, and that his attention should be devoted to that entirely.

20967. Whether he has other work to do or not. Supposing he is only winding a few times in an hour ?—That is a different thing altogether.

20968. It is a question of degree. It depends entirely on the degree ?—Of course I would not say that a man should stand idle altogether. I am speaking now of when they are running at a high pressure speed, and then I say there should be a provision that a man should not be allowed to go away from his engine.

20969. Are there any engines running with two enginemen ?—Yes.

20970. Those are running at a very high tension ?—Yes.

20971. Is it the practice, where they are pumping underground, for the engineman to keep his boiler going as well ?—I could not venture an opinion upon that. When they are pumping underground my impression is that they get the steam from the top, but I think that electricity is now taking the place of steam for work of that kind.

20972. That is now being done ?—I believe so.

20973. (*Mr. Ratcliffe Ellis.*) What is your view as to the object of Government inspection in mines ?—My view is a very simple one. It is that they should visit the collieries and see that the management is carrying out all the operations in conformity with the Coal Mines Regulation Act and the Special Rules, and general safety I should add.

20974. It is quite impossible, I think, that there should be any system of Government inspection (I will refer to Rule 38 afterwards) day by day ?—I do not suppose that we would ask for that.

20975. To carry it to an extreme length, you would wish that day by day there should be some security that the Coal Mines Regulation Act was being carried out in every mine ?—I did not say so, because I believe that to be, so far as Government inspection is concerned, impracticable.

20976. Then we agree there. How near do you think you that can get to that ? The idea would be to see that in every mine every day the Coal Mines Regulation Act was being carried out. You admit that it is impossible to get that from Government inspection ?—We are not asking for that.

20977. You agree with me that it is impossible. I want to know how near you can get to that ?—We have, through

Digitized by Google

Mr. J. Weir.

11 June 1907

our Mines Bill, asked for a Government Inspector for each 10,000 men employed in and about the mines. We think if the inspectorate was increased to that extent it would improve matters.

20978. That would mean about 80 inspectors instead of about 40, as at present ?—Well, suppose it did ?

20979. What do you expect you would get from these 80 men ? How often do you suppose that each mine in the Kingdom would be inspected ?—That I could not venture to say, as I told Sir Lindsay Wood, but I suppose that it is not too much to ask that they should be inspected once in every six months.

20980. If inspected once in every six months you would have to assume that what the inspector saw at that inspection represented the normal condition of the mine ?—The inspector would just have to form his own conclusions.

20981. He would have to conclude that. If he were satisfied, he would have to conclude that what he saw then represented the normal condition of the mine ?—I understand that he would take that for granted.

20982. Do you see any reason why he should not obtain the same information if he inspected once a year instead of twice a year ?—It is not possible, in my view, that he could. You might as well say if he examined it once every three years that he would have the same opportunity of correcting what was going on wrong,

20983. It is a question of degree ?—Yes.

20984. Then you think if he inspected twice a year that he might reasonably assume that what he saw was the normal condition of the mine ?—It would have a tendency to keep things better.

20985. That is with reference to inspection by the Government inspector ?—Yes.

20986. With reference to grades of inspectors, do you propose that there should be a class less qualified than the present inspector amongst these additional inspectors ?—I was proposing that practical men who held certificates, either first or second-class certificates, should be eligible to take up that work under the direction of the district inspectors.

20987. Are they not eligible now ?—First-class holders of certificates.

20988. If they can pass an examination by the Home Office ? That is so.

20989. Do you wish to do away with the Home Office examination, and make either first-class or second-class certificates sufficient ?—I would not ask you to have as stiff an examination for these inspectors as you would have for the chief inspectors.

20990. Why not ?—I do not think that it is necessary. In fact, my main reason for holding that view is, that there would be a tendency to limit the selection from good and practical men.

20991. Why should it limit the selection from good and practical men ? I understood you to say that you had no complaint to make against the present inspectors, except that there were not enough of them ?—Yes, that is so.

20992. What do you suppose would be gained by having an inspector less qualified than the present inspectors ?—I do not say that they would be less qualified. I hold that practical knowledge is equal to a great deal, and that practical knowledge, plus his theoretical knowledge gained by his study for his certificate, would make him an excellent adjunct to the inspectorate.

20993. Every man who gets a certificate is required to have had five years' practical experience about a mine ?—About a mine, but not——

20994. I want to know what class you say that the inspectorate should be. Must it be confined to a man who has worked at the face ?—That is my view.

20995. Take a man who has been engaged in a mine, say a young gentleman who is a pupil at a colliery, and who is down the mine every day inspecting and examining it: do you think that, because he has not worked at the face that he should be disqualified for one of these posts ?—If he has the practical knowledge equivalent to a man working at the face, I do not say that I would object.

20996. What is the special knowledge that a man gets for the purpose of inspection by working at the face ?—The special knowledge that he gets is a knowledge of the dangers that arise through falls of roof, and what not.

20997. Is that the sole object of inspection; I am speaking about Government inspection now. Can you suggest any special knowledge that a man gets from working at the face to qualify him for a position of an inspector; I mean, any more than a man gets by making the inspection all over the mine ?—I think his practical experience goes a long way to qualify him.

20998. Because he has got coal ?—Not because he has got coal exactly, but if he holds a certificate such as I have indicated, I think his practical experience gives solidity to his knowledge which a man who has not had that work to do has not got.

20999. Any person who has had practical experience of examination in a mine, or of doing anything down a mine except coal getting, you would exclude from the chance of getting one of these appointments ?—I would not go so far as that. If a man had been engaged as an overman, or as a fireman, or in any other department, I do not say that he should be excluded.

21000. Do you not think that a man who has been engaged in that work would be better qualified to discharge the duties of an inspector than a man who has been merely engaged in working at the face ?—I do not think that he would be any better.

21001. I want you to come as near to my view as you can. Do you not think he would be better qualified than the man working at the face, because he has been engaged in making an inspection as to the general condition of the mine, which is what an inspector has to do ?—I believe that you are perfectly correct in what you are aiming at, but I believe that a man engaged as an overman holding a certificate, going through the mine inspecting it, would be better qualified than a man who had never done that work.

21002. A man who has done that is a practical man, whatever his class may be ?—Yes.

21003. It is not a question of class at all. Whatever class he comes from, if he has had that experience and obtained a certificate, he should be eligible to inspect ?—That is so.

21004. Do you think that some inspectors should not be bound to pass the examination of the Home Office ? Will you tell me why you think some class of inspector should be exempt from that ?—The only reason I can give is this: I understand qualification for the examination for an inspectorship just now is a thing that a great many of our men would not face very readily.

21005. Why should they not qualify themselves for it ? There is nothing that a Scotchman cannot do if he puts his mind to it ?—They are supposed to be hard-headed, but what is in my mind is this: Suppose this class of inspectors were created, and these men were appointed with an examination of some kind, but not so stiff as the Home Office examination, before they could be promoted to hold a district inspectorship, my view is that they would have to undergo a further examination in order to test more fully their knowledge of mining. I mean more fully than when they were examined before.

21006. I see in your Bill you say: "The assistant inspectors shall be generally under the control of the senior inspector of the district, and may perform any of the duties of an inspector which may be delegated to them, either generally or in special cases by the inspector, and shall also perform any duties which may be assigned to them by a Secretary of State." Therefore you contemplate that they may perform all the duties of an inspector certainly for the duty of inspection. This additional inspectorate is for the duty of inspection: you think that there is not sufficient inspection, and you want a further inspection of the mines. If he is to perform the same duties as the chief inspector, why should he be less qualified ?—I do not say that he is less qualified in the least. He holds the certificate as a manager, for example, but all that I claim exemption from is that he should not be asked to undergo the stiff examination that is now necessary.

21007. If I understand you rightly it is because a particular class of persons would not be able to pass it ?—I do not say that they would not be able to pass it.

21008. Then why should not they pass it ?—I do not see that it is necessary that they should be so particular in insisting upon that high class examination for a subordinate position of this kind.

21009. That is your view ?—Yes.

21010. With regard to the French system of inspection, do you remember after the Courrières accident that difficulties arose with reference to what they called the engineers, and the men revolted against these engineers being put in charge of the work and examining the mines ?—Yes.

Digitized by Google

21011. Were those Government inspectors?—I could not say whether they were or not. I think, from my reading of the reports of the accident, that these engineers were employed by the company, but I am only speaking from recollection.

21012. You do not know that those were the Government inspectors, and that it was thought by the practical managers that they could possibly do better without them?—You do not know whether that was so or not?—No.

21013. So much for the inspection. Do you recognise that it is desirable that the manager of the mine should have the responsibility for seeing that the Coal Mines Regulation Act is carried out?—I do.

21014. Do you think that it would be a very unfortunate thing if anything was done to lessen that feeling of responsibility?—I do not see why anything should be done to lessen it.

21015. That is not the point. You think that it ought not to be lessened, and that it would be prejudicial to safety if that feeling was lessened?—That is so.

21016. Do you think that a too frequent inspection (I am not discussing now how often it should be) might not result in relieving the manager from responsibility?—I cannot see it.

21017. A manager might say: "The inspector has seen it, it is all right," and so on?—I cannot see it.

21018. You do not think that would be so?—I do not think that there is a possibility of it. If an inspector came to a colliery and said that there was nothing wrong, and there was really something wrong, I do not see why that inspector should not be blameworthy as well as the manager.

21019. Now I want to ask you, with reference to inspection under General Rule 38, you quite agree that it would be reasonable that a mining engineer should not be permitted to make that inspection?—I have said so.

21020. Why?—I have no particular reason to give.

21021. I want to know what your reason is?—It is because the employers insist upon it.

21022. I understood that you thought it was reasonable, and I want you to tell me why?—I have no reason to give further than we concede that to the employers because they ask for it.

21023. Will you tell me why you think it reasonable?—I suppose that the employers consider that they would not like professional men to come and see things about their collieries that they do not want them to see.

21024. They might come and get information apart from the ostensible object of coming for the purpose of inspection?—Yes.

21025. Might not this be the case with the itinerant inspectors you propose to appoint?—I do not think so; they would be drawn from a different class altogether.

21026. They are to be under nobody's control but yours?—We should have the appointment of them, but that would be a matter for the——

21027. Are you aware that the Government inspectors are under very strict regulations with reference to what they may and what they may not do in connection with their inspections?—Yes.

21028. Do you think that is reasonable or necessary?—I do not think that it is unreasonable. I do not think it unreasonable that there should be some limitation.

21029. Do you not propose that employers should be protected against the misuse of this power of inspection with regard to these itinerant inspectors to be appointed by you?—I cannot see that there is any possibility of misuse of an inspection of this kind, so long as a manager keeps his mine in a condition which conforms to the Coal Mines Regulation Act and the Special Rules.

21030. Supposing that there is some dispute with reference to a price list in connection with some part of the mine, and the miners' agent went down ostensibly for the purpose of inspection, do you not think that he would have the means of causing a good deal of embarrassment and trouble if he chose?—We do not for a moment consider that that would come within the scope of these inspectors at all; I mean, to go and inspect the mine for the purpose of settling the price list.

21031. What is to exclude them from doing it? I want to remind you of your Bill and the powers that you propose to give to these men. "The following rule shall be substituted for rule 38:—'Rule 38.—(1) The workmen employed in any mine may from time to time appoint any persons who are or have been practical working miners to be examiners of the mine on their behalf. (2) Such examiners may at any time examine the mine or any part thereof, or any old workings, shafts, machinery or apparatus connected therewith, and every facility shall be afforded for any such examination by the owner, agent, and manager of the mine, and by all persons in the mine. (3) The examiners shall make a report in writing of every such examination, and shall communicate the same to the workmen, either by placing it in a book to be kept by the workmen for the purpose, or by reading it to a meeting of the workmen, or in such other manner as may be from time to time determined by the workmen. (4) If the examiners in any examination consider that any danger exists or is to be apprehended in the mine, they shall make a report in writing to that effect to the inspector of the district.'" You propose to give very large powers to these inspectors, but there is not a word here said about reporting anything to the manager of the mine. It is all to be done behind his back. I put this to you: if there is an objection to a mining engineer coming for other purposes than inspection, is there not the same objection to a miners' agent coming?—I do not see any objection.

21032. Can you imagine that a coalowner sees a good deal of objection to it?—I cannot see any objection so long as the colliery is conducted properly.

21033. I am assuming, if he has a right to come, he has a right to come there for any purpose he may choose to go down the pit for. Can you see that it is reasonable on the part of the coalowner to say that the person who has to make that inspection should be under strict regulations not to use the information that he gets to the prejudice of the owner?—I should say that he should be protected against anything that could be used to his prejudice.

21034. How would you propose to protect him?—I have no idea; I have never applied my mind to that. It never occurred to me that that was possible. I mean, that information could be applied to the prejudice of a coalowner in a mine which, properly conducted, and all I understood that these men should be empowered to report, either to the inspector or to the workmen, was any defect in the mine, or the case of any regulation being violated; and if you think it is prejudicial to the coalowner for them to make reports of that kind, I am afraid I cannot agree with you.

21035. I do not at all. The men at the pit, you agree, are the most competent to make an inspection for the purpose of safety. The men who are working in the mine know the pit, and if it is a pure question of safety, they are the most competent persons to make an inspection?—In one sense they are the most incompetent men, because they are not free agents.

21036. For the purpose of safety the men working in the pit are the best persons to make the inspection?—Providing that they were free agents.

21037. Do you know any case in which any man has suffered in any way at any colliery through having exercised his power?—I have no case I can name.

21038. Then why do you suggest this?—It is difficult to find cases of that kind, because these cases can be dealt with in a manner that we cannot discover very readily; besides, what I have told you about these inspections is sufficient to cover these points. I have told you that we have scarcely ever had any defect reported, and this is why the men have got lukewarm in making these appointments, because they do not see that there is any practical result.

21039. The reason you have had no bad reports is that there is nothing bad to report?—I did not assume that.

21040. The only case which you have given to the Commission is a case in which there were very serious reports made: but the men at the pit examined it and found that everything in it was all right?—They reported so; I do not say that they found it so.

21041. I see that Mr. Ronaldson, one of the Government Inspectors for Scotland, gives another reason why these examinations are not made. It is Q. 4980: "Do you suggest to the owners and the men that such inspection should take place?—(A.) I have suggested it, but I have been met with this reply—that the Government Inspectors are paid for inspecting, and the men are not going to do it"—that is the reason that he gives.—"I do not say that is the general feeling, but that is the reply which has been given when we have spoken about the matter?"—In our district I have never heard that put forward as a reason.

Mr. J. Weir.
11 June 1907

21042. The alteration that you want is, that this General Rule should be extended, and that these very wide powers, entirely uncontrolled by anybody, should be given to an itinerant inspector to be appointed by the worker, to go wherever and to go whenever he thought fit ?—I want what we have in the Bill. We do not want the wide powers such as you interpret them.

21043. Is not that what you are asking for in the Bill ?—No ; I do not agree with your interpretation.

21044. There is not much difference of opinion about that. You agree that this man who makes the inspection should be under some control, so as not to use it prejudicially to the employer ?—If you think that requires to be safeguarded, I have no doubt that the Commission will know now to safeguard it.

21045. If the Commission thinks this power should be extended, would you be prepared to say that it should be subject to the inspector not using any information to the prejudice of the owner ?—I should think that is perfectly fair. All that he has to report on is as to the general safety of the mine.

21046. And that he is not to do anything in connection with reporting which may prejudice the owner ?—Yes, I think that is fair.

21047. If he reports adversely, it is to be solely on the question of safety ?—Yes. I have safeguarded myself by saying that.

21048. Now I will ask you about the firemen. I am quite sure we have known each other long enough for me to know what you have said here is what you quite believe is the state of things, but, after all, it is from information given to you by somebody else ?—Chiefly.

21049. During the last 30 years you have had no experience as to the way the firemen do their duties ?—I have never been underground much.

21050. Can you submit to the Commission any evidence from people from whom you get your information as to the negligent way in which the firemen discharge their duties ? —I have made enquiries frequently, and it is matter of common talk among our representative men, when the subject is under discussion, that the duties of the firemen are performed in the way I have described to the Commission.

21051. I do not want to ask you to give it if you feel that you should not give it, but can you give any collieries where you say that this is so, in order that it may be enquired into ?—I think you may take the whole of the collieries : I do not think that there are many exceptions.

21052. In the whole of the collieries I understand you to say that there is no examination of the roadways ?—That is my information. In fact that was my experience when I was in the mine myself.

21053. How long have you known that, because you put that as being a great source of danger ?—It has been known to us for years and years, and it has been known to the managers, and it has been known to the Government Inspectors.

21054. I want to read to you from the special Rules under the Coal Mines Regulation Act, 1887, printed by permission of the Joint Committees of the United Mining Associations of Scotland. Rule 35 says : "It shall be the duty of the fireman, or firemen, if more than one, in their respective divisions and shifts, to perform the duties of inspecting not more than two hours immediately before the commencement of each shift, the roadways, working places, and every part of the mine situated beyond the station, or each of the stations, appointed at the entrance to the mine, or different parts of the mine, in terms of the Statute, and in which workmen are to work or pass during that shift, and to ascertain the condition thereof, so far as the presence of gas, ventilation, roof and sides, and general safety are concerned. The above inspection shall be made with a locked safety lamp, unless inflammable gas has not been found within the preceding twelve months, which it shall be the duty of the manager or under-manager to ascertain and intimate to the fireman, and in every case where the mine is worked with safety lamps. For the purpose of this rule, two or more shifts, succeeding one another without any interval, are to be deemed one shift. In making the above inspection the fireman shall mark with chalk the day of the month upon the face of each working place, as 1, 5, 10, 25, or other numbers as the case may be."

"(36). In the event of the fireman finding either the ventilation or roof and sides defective, or anything affecting the general safety of the mine between the pit bottom and the station underground, he shall at once return to the pit bottom and report so as to prevent persons descending."

"(37). He shall record without delay in a book to be kept at the mine for the purpose, and accessible to the workmen, before commencing work, where obnoxious or inflammable gas (if any) was found present, and what defects (if any) in roofs or sides, and what (if any) other source of danger were or was observed in his inspection before commencing work, and such Report shall be signed by, and so far as the same does not consist of printed matter, shall be in the handwriting of the fireman who made the inspection."

"(38). He shall be careful to ascertain that every part of the mine and roadways, so to be examined, is free from fire-damp, choke damp, and other impurities, and is safe for workers to enter and to work therein ; and in case fire-damp or other impure air shall be discovered in any working place, road or level, the fireman shall, in the first instance, thoroughly clear the same of such impurity—if that can be done easily—and shall thereupon report to the miners and other workers, that the same is safe : but if the impurity cannot be readily or at once cleared out the miners and workers shall not be permitted to enter any such working place, road, or level, or, if the accumulation be dangerous, into any place ventilated with the current air which has left that place until the impure air shall have been, by further appliances, entirely dispelled. He shall prevent miners or other workers entering the roads of working places until a report shall have been made that they are safe. If no fire-damp, choke-damp, or other impurity shall be discovered, or suspected to remain after such inspection, the fireman shall make report to the miners and workers, and allow them to proceed to work."

I will not read the whole of them, but you say that you have been aware, and the men have been aware, that these Rules have not been carried out for years past ?—They have not been sufficiently carried out.

21055. What steps have you taken to see that they should be carried out ? The fireman has to examine both working places and roadways. What steps have you taken to prevent this great danger which exists through the fireman not doing the work which by the Special Rules he is required to do ?—We have not taken any steps, because it is common knowledge to the Government inspectors themselves that this is not done.

21056. That is going rather a long way ?—No.

21057. Have you communicated with the inspectors ? —No.

21058. Then you have done nothing ?—In that respect we have not done anything.

21059. You have sat down and left this state of things. I want to read to you another passage. But tell me, first of all, what is a roadsman ?—He looks after the roads and examines the chains and other things.

21060. Will you look at Rule 47 : "The roadsmen, in their different divisions and shifts, if more than one, shall, at least daily, make careful inspection of the whole roadways from the pit-bottom throughout the mine where men are to work or pass, and shall keep the same free from all obstruction, and of the height and width necessary for proper passage and for ventilation." Have you allowed that rule to be a dead letter ?—Not that I am aware of.

21061. Have you done anything to see that the roadsmen keep the roadways free from obstruction and of the height and width necessary for proper passage and ventilation ? —You must understand that it is difficult to prove when these rules are violated.

21062. Do you not think that you should be a little more careful in telling the Commission that these duties are neglected in this wholesale way ?—We know it is. I am only telling you what I know.

21063. Can you put before the Commission any evidence of any colliery in which this state of things exists ? Why did you not communicate with the inspectors if you had known these rules were being systematically broken for years ?—Simply because the inspectors knew as well as we did.

21064. That may or may not be an answer, but still you did not think it worth while to do it ?—We did not do it.

21065. Did you make any communication to the managers of these different collieries where this had been neglected ? —I never got instructions to do so from the men, and it may be pointed out that the men themselves are very

Digitized by Google

dilatory in taking up a position to give me instructions, even assuming I am their agent to make complaints of that kind.

21066. You know that the inspectors are always ready to receive any complaints, anonymous complaints, and they immediately make enquiry into them ?—I have made complaints to the inspectors when I have found danger exist, and they have been immediately attended to.

21067. In this particular case, which you consider a great source of danger, you have not made any report either anonymously or directly to the inspector, calling attention to the breaches of these rules ?—I have not had instructions to do so.

21068. Now with reference to timbering, some of your colliers think, and a good many people agree with them, that the collier is the man who can best look after his own safety with regard to the timbering ?—That is quite a common impression.

21069. In your own view is not that so, that the collier is the best qualified to protect himself from falls of roof, by putting his own timber up ?—Provided he is a trained collier.

21070. I suppose these old men you speak of are trained ?—Yes.

21071. Where did they get their training ?—By experience in the mine.

21072. That is the way everybody gets it. If a man is not allowed to work more than two years at the face alone, he gets it during that two years ?—Yes.

21073. Do you suggest that a collier should not do his own timbering, but that it should be done by somebody else ?—I have suggested that it should be done by somebody else with a view to reducing the number of accidents.

21074. The deputy, or whoever the official is who is going to put the timber up, cannot always be there ?—That is so.

21075. Supposing the collier wants some timber put up, is he to stop till the fireman puts the timber up ?—No, he should be at least directed to look after his own safety, provided there is any danger.

21076. What would be the objection of your old colliers to anybody else doing the timbering ?—Because they think they can do it better themselves.

21077. Safer ?—They would have that impression, no doubt.

21078. You know Mr. Hancock, of Nottingham ?—Yes.

21079. He was asked this question with regard to timbering at *Q.* 20,397 : " With regard to timbering do you suggest that it should be the duty of some mine official to go round to the working places constantly with a view to looking after the timbering, advising a man as to what he should do with regard to the timbering, at all events, if an inexperienced man ? — No, I do not know that I suggest that ; in fact it is to some extent done now with regard to all the men." You know in his district the men do the timbering ?—The same as others.

21080. Except Northumberland and Durham ?—Yes.

21081. Have you noticed the statistics from falls of roof? It is only in the working places that the collier does timbering. The timbering is done by the roadsmen in the road ?—By brushers and repairers in the road.

21082. In the Midland District, taking the five years ending 1900, there is a death rate per 1,000 persons employed underground of ·58 as compared with Northumberland and Durham and the Newcastle districts, where the timbering is done by officials, of ·65 and ·75, so that in the Midland district where the timbering is done in the way that your old colliers think it should be done, by the collier, the death rate is lower than in Newcastle and Durham, where the timbering is done by the deputy ?—Yes.

21083. So that it is not all in the favour of safety ? It might have been on the roof.

21084. I daresay there are reasons, but still it is so ?—Have you any information as to the character of the roof comparatively in the districts you have quoted ?

21085. It may be that has something to do with it, but still it is a matter of fact where the timbering is done in that way it shows the smallest percentage of any place in the Kingdom. I notice in your Bill with reference to timbering that you do not make that suggestion that anybody else should do it ?—No.

21086. What you suggest is to amend Rule 22 as follows : " Where the timbering of the working place is done by the workmen employed therein, suitable timber shall be provided at the working place by the owner of the mine, and the distance between the sprags or holing props where they are required shall not exceed six feet, or such less distance as may be ordered by the owner, agent, or manager." All you suggest in your Bill with reference to timbering is that instead of the management leaving the timber at the gate-end or pass-by, and the collier or his drawer taking his timber from that point to the working place, that the management should take the timber to the working place ?—That is what is suggested in the Bill.

21087. That is a question of wages, is it not ? It is relieving the drawer and collier of something he has had to do now, and included in his tonnage rate ?—That may be so if it is a long way to bring the timber.

21088. That is a question which would affect wages ?—It would have a very slight effect on wages under ordinary conditions.

21089. That is all you say in your Bill as to the reformation as to timbering. Now as to haulage accidents, you suggest that there should be sufficient room for passage in the travelling roads ?—Yes.

21090. Is there usually room now if it was kept clear ?—No, not that I know of. There may be a road here and there with room.

21091. Have you the Special Rules there ? Rule 47 says : " The roadsmen, in their divisions and shifts, if more than one, shall, at least daily, make careful inspection of the whole roadways from the pit-bottom throughout the mine where men are to work or pass, and shall keep the same free from all obstruction, and of the height and width necessary for proper passage and for ventilation." What more do you want than that ?—Proper passage of what ?

21092. Who passes there ?—I suggest a sufficiently wide road that a man can pass between the hutches and the side of the road.

21093. What is the meaning of this : " of the height and width necessary for proper passage " ?—It may be for proper passage of the trams only, and ventilation.

21094. Will you just look a little before that : " Where men are to work or pass "—men, not trams ?—That does not define that the road is to be sufficiently wide to give a space of two feet.

21095. It says it must be sufficiently wide for men to pass, because, on reference to the roadways where men are to pass or work—— ?—If you interpret that to mean that, that roadway is to be sufficiently wide for men to pass the hutches as they are being hauled.

21096. That is the rule ?—We have not been able to get that. I do not think it has ever been interpreted to mean that.

21097. There is insufficient room now ?—As a rule.

21098. You have no complaint about manholes except that they should be whitewashed to show where they are, and kept clear ?—We have had complaints about manholes, but we have had these remedied when our attention has been drawn to them. Sometimes they are filled with dirt.

21099. That is contrary to the Act of Parliament ?—Yes. We get that put right when complaint has been made.

21100. The inspector would get that put right directly they tell him. With reference to runaway trams you want some system by which, as far as practicable, if the trams run away, somebody should be responsible. Everyone wants to have that ?—That is so.

21101. With reference to enginemen, while the man is winding he must be at his engine ?—Yes.

21102. In your Special Rules he is required to make a general supervision. Special Rule 22 says : " He shall see that the engines and boilers are always in good working condition, that the pumps and whole machinery and gearing connected with his engine are in a safe and effective state." You do not object to that. That does not necessarily take him away from the engine when the engine is at work ?—That is so.

21103. Do you think that that ought to be deputed to somebody else ?—If his attention is to be constantly engaged in winding it should be deputed to somebody else.

Digitized by Google

Mr. J. Weir.

11 June 1907

21104. You think if he has to do the winding he ought tc do nothing else ?—If he is constantly employed at winding, as in some collieries they are, it must be done by someone else.

21105. Do you know that a Select Committee of the House of Commons sat to consider the provisions of a Bill introduced to give engine-winders certificates ?—No, I have not seen anything about that.

21106. You do not know that they reported that it was not necessary ?—No, I have not heard any information about that.

21107. Will you tell me why you think that enginemen should have a certificate ?—Because it would be a guarantee of his efficiency.

21108. What do you consider the qualifications of an engineman ?—To know his work, to understand the mechanism of his engine and steam boilers, and what not.

21109. I suggest those are the least. You can ascertain that by the examination. Is not nerve a qualification ?—You cannot get that by examination.

21110. Is not that one of the principal qualifications for an engineman ?—A steady engineman, a man with nerve and resource.

21111. And character ?—Yes.

21112. Those things ycu cannot get by examination ?—Probably not. You could learn it by examination, but you could not give him a certificate of that.

21113. There is no class of men who do their work better than the enginemen ?—As a rule I have no fault to find with them in our district.

21114. As to these unskilled workmen, are you alluding to these foreigners, these Poles ?—Those, among others. The statistics do not allude to Poles, because there is not a Pole among these.

21115. These men are working on the roads ?—I cannot tell you.

21116. With reference to a collier, he must have some training, according to the Act of Parliament, whatever it may mean. There is nc statutory regulation with regard to a man who works on the roads as to what his qualifications should be, as there is in the case of a collier ?—I did not follow you.

21117. There is no statutory regulation as to the qualificatcn of any workmen down below except the collier. The collier must not work unless he has been two years at the face alone ?—I see the point now.

21118. There is no statutory qualification required ?—No, unless an under-manager.

21119. You must select competent people to do the work of inspection, but working on the roads and getting stuff out of a mine does not require any special qualification ?—No.

21120. You are aware it is suggested if the hours of labour underground are limited a great many more people will be required for that kind of work ?—It is suggested.

21121. Where are they to come from ?—I do not know that they are required. It is a matter for experience yet to know.

21122. Do you suggest that there should be some qualification required for a person who works in a mine other than the collier and inspector and officials ?—Do you mean about the two years ?

21123. I am not alluding to the collier now, but to any other person engaged in the mine other than the officials ?—Some qualification should be imposed upon them before they get promoted to another position. We have never imposed anything of the kind.

21124. I do not know what your complaint is about unskilled labour. It does not apply to the collier ?—The only complaint we make about unskilled labour is where any danger arises from its employment.

21125. Where is it ? What labour is it you consider now ?—We are frequently told that the men who do not speak the language cannot understand the orders given.

21126. That is the Poles ?—Yes.

21127. With regard to the people who can speak a language which is understood, you would not exclude them from any class of labour ?—We are not seeking to exclude them.

21128. The source of danger from unskilled labour is people who cannot understand the language ?—That is said to be a source of danger. We have not any Poles in Fife.

21129. It is confined to the employment of these Poles. Have you had a translation of the Special Rules into their language in Scotland ?—I understand they have had them.

21130. Where is that ?—They are not in our district, because we have no Poles at all.

21131. They must be on the other side ?—You will have that from other witnesses.

21132. I do not know whether you agree with Mr. Ronaldson who gave evidence as to the want of care on the part of the men. Did you see what he said about that ?—I do not know that I have seen that particular part of his evidence. I have dipped into some parts of his evidence, but I have not that part in my mind.

21133. He gives a quotation from his report (Q. 5013): "It is obvious that in order to prevent accidents, so far as it is possible to do so, carefully-considered regulations have to be laid down, but it is equally obvious that, unless these regulations are complied with by the workmen and enforced by the officials, the desired object will not be attained. Year after year disregard of the regulations is the direct cause of a large number of preventable accidents. There is a spirit of defiance against discipline at work among many of the miners, which is very much to be regretted, and to this I attribute many of those lamentable accidents which never ought to have occurred. To trace the origin of this state of matters one has to go to the homes in which these miners were reared as children. It will be found, I believe, that as children they have not been taught there the duty of obedience and of subjection to proper discipline. The consequence is that they grow up with the impression that they are their own masters, and they become impatient of restraint. When they enter the mines they carry these ideas with them, and when they are met there with restraints imposed upon their free actions by the stringent regulations, there is a constant conflict between their undisciplined wills and the wills of those whose bounden duty it is to see that the regulations are enforced."—That description does not apply to the Fife miners.

21134. (*Mr. Smillie.*) How do you know ?—Because I have been going in and out among them.

21135. (*Mr. Ratcliffe Ellis.*) You do not agree with that ?—I do not agree with him ; it does not apply to any miners I have come in contact with.

21136. (*Dr. Haldane.*) I should like to ask your views about improved sanitation in mines which you refer to at the end of your statement. What steps would you suggest ?—That is in reference to preventing the introduction of the miners' worm disease.

21137. Do you think there is much need for conveniences underground, for instance ?—In mines where there is the possibility of this disease being introduced, I think there is, because we are getting foreign workmen amongst us now, and it may be developed before we know much about it, and if there were conveniences put into the mines it would very much help to prevent any development of the disease.

21138. Is the working face usually fairly dry in the Fife mines ?—In some places it is wet, and in some places it is fairly dry.

21139. There are places where it is wet ?—Yes.

21140. And fairly warm ?—Our temperature does not go high yet, but we are getting into a condition of things with deeper mines which will bring about this state of matters.

21141. As a rule in the deep mines in England the working face is dry, so that there is less danger of miners' worm disease at any rate. I do not know whether that is proved so in Fife ?—We have never got nervous over this matter in Fife. We do not think there is any immediate danger.

21142. You have never gone into it very specially then ?—No.

21143. There is a matter you have not mentioned in your statement. Have you considered whether it is desirable to provide means of washing for the men when they come up from the pit, and of changing their clothes and leaving their working clothes at the pit-head ?—I think it would be an excellent arrangement if it could be carried out.

21144. I suppose you have heard from description of the arrangements that are made in foreign countries ?—I have seen them there. I have seen them in Belgium, where they have baths. I think it is an excellent arrangement.

Digitized by Google

21145. Do you think there is any great feeling among miners in Scotland in favour of that, or has it been considered?—I do not say that I could form an opinion as to the feeling existing in regard to the matter at all. My belief is that if this were introduced, by-and-by the men would get so educated, that the men would like to go through it the same as elsewhere. You cannot get any new thing introduced right off the reel, so to speak, enthusiastically, but if it was introduced, I think before many years it would be largely accepted as being a good thing by the men.

21146. Have you any idea what the wives of the men think on the subject? I think they must be troubled by their husbands coming home and making a mess?—I have not consulted the wives, but if I had, I am certain they would be of one opinion.

21147. (*Mr. Ratcliffe Ellis.*) It is a question of whether it is better to have a bath at home or at the mine?—I would prefer them to have it at the mine—that is my personal view and keep the home as clean as possible.

21148. (*Dr. Haldane.*) It must make an awful mess, men coming home in their working clothes?—At one of our collieries we erected baths in the colliery village, which have been taken advantage of, not largely, but it is a training ground for that sort of thing.

21149. Are they plunge baths?—No, shower baths and ordinary hot water baths.

21150. The shower baths are the quickest and the cheapest and the most effectual, I think. With regard to certificates for engine-men, which I think you are rather in favour of, do engine-drivers on railways undergo any examination?—I am not aware of how they are dealt with. I know they undergo tests for their eyesight.

21151. I do not think there is an examination, but I am not sure?—I do not know of any.

21152. That is an equally responsible position?

(*Mr. Ratcliffe Ellis.*) I think there is an examination by the company.

21153. (*Dr. Haldane.*) I was wondering if the companies have an examination. I know they have for signalmen?—These eye-tests are very important for both engine-men and signalmen.

21154. (*Mr. Ratcliffe Ellis.*) You do not mean an examination by the employer; you mean an examination by the Board of Trade when you speak of an examination?—That is so.

21155. (*Dr. Haldane.*) It comes to the same thing in the end. I want to know, as a matter of fact, do you think they institute some test in the way of examination before allowing them to drive engines?—I do not think they institute the test in the manner we indicate—what we want for engine-men. I do not know of any in fact. I could not venture to give an opinion upon the point.

21156. I think there is some examination held for signalmen on the railways which is in some ways like an engine-man in a colliery?—The company examines them as to their efficiency, and as to their being able to read a code of signals—which is a very elaborate one, too, sometimes.

21157. (*Chairman.*) Looking at your Bill, I do not see under Clause 7 that there is anything to show that you want any different class of assistant inspectors from the class which are now appointed. Do you wish that these assistant inspectors appointed by the Government should have a different examination from the present assistant inspectors—that there should be a sort of third class—or would you be content with having many more assistant inspectors of the same class, and paid the same salary?—My view is, that these men should be drawn from the practical men.

21158. They are, mostly. Most assistant inspectors have been fairly practical men and know something about mines, at all events?—I understand they must have done or they would not be in the position.

21159. You seem to think, without it being necessary to put anything in an Act of Parliament, that it would be a good thing if the Home Secretary, more than he does at present, appointed as assistant inspectors men of practical experience?—That is so.

21160. Would you have more district inspectors than you have at present?—No, I have no idea of changing the district inspectorate. We want a larger staff.

21161. Instead of having two assistant inspectors, as all of them have now—and one or two have three—you think that every chief inspector should have four of five or even six assistants?—That is so.

21162. In that case, I am afraid the promotion would be much slower. You would still promote your assistant inspectors to district inspector, and as there are so many more men waiting to be inspectors, they would not get made inspectors so early?—That is, district inspector?

21163. Yes. If you had an enormous addition, or a very large addition, three times as many assistant inspectors, the assistant inspectors would have less chance of becoming inspectors at a reasonably early stage. There would be a block in the promotion?—That undoubtedly would be so.

21164. That would have to be got over somehow, I suppose. With regard to the other kind of inspectors—these itinerant inspectors, as Mr. Ellis has called them—they should be appointed by the workmen. You consider it would be best to have a certain number of men more or less permanently employed, and that these examiners should not be constantly changed, sometimes one set of men and sometimes another set, but you think it would be as well that the same men should be appointed to be examiners very much as the assistant inspectors, and should be examiners all their lives?—I do not suggest that.

21165. On page 8 of the Bill: "Workmen employed in any mine may from time to time appoint any persons who are or have been practical working miners to be examiners of the mine in their behalf. Such examiners may at any time examine." I want to find out whether you are of opinion that it would be a good thing that these examiners should be, so to speak, permanent in some way as the assistant inspectors, or men appointed from time to time as they now are?—I do not suggest that they should be permanent.

21166. They should have power from time to time to appoint persons for a particular job?—For a particular district.

21167. For how long should they be appointed? What I had in my mind was this, that we could appoint, say, two men to cover the whole area of Fife, and after that was finished——

21168. Their duties would be terminated?—The appointment would be over.

21169. When they have gone through a district the appointment is over, and they might or might not be re-appointed. As to that you have no opinion, and that should be as the men choose?—Yes, that is so.

21170. You say, for the safety of the mine, no more than one unskilled man should be allowed to work with a skilled man at the face. Your Bill goes a great deal further than that, because it would not allow any unskilled man to work at the face at all. If you have a law to enact that only one unskilled man should work under a skilled man at the face, do you think it would be necessary for a man to have three years' experience on the roadway before he should be taught to become a hewer by an experienced man?—That is more stringent than my proposal.

21171. You would be satisfied with your proposal that no skilled man should be allowed to teach more than one unskilled man at a time. He should be allowed to teach anybody he liked?—That is so. This Bill indicates that they have to have some experience before they go to the face.

21172. Three years on the roadway?—What I have in my mind is to prevent young men going into a mine and going straight to the face at 20 years of age, for example. They should at least have two years under a skilled workman.

21173. Under a skilled workman at the face or anywhere?—At the face.

21174. I understand, under your Bill, that you would not allow any man, even one single man working under another single skilled man, to go to the face at all until he has been in the mine three years. I want to know whether you think that is desirable. Supposing you have a law to enact that a skilled man should take one unskilled man to teach him his business at the face, is there any reason why, if he thinks the man is strong and capable of making a good hewer, that he should not take him to the face at once under proper precautions—say his own son?—I do not see any reason if he is under proper supervision.

21175. You would be inclined to think, if precautions of another nature were taken, Sub-clause 17 of Clause 11 might be unnecessary?—It probably might fit into certain districts where they must, in the ordinary training, be engaged in the roadway to begin with.

Digitized by Google

Mr. J. Weir.

11 June 1907

21176. As a general rule a man would be engaged on the roadway ?—Yes, as a drawer.

(*Mr. Ratcliffe Ellis.*) It would be considerably limiting the available labour in mines.

21177. (*Chairman.*) There are two things you have been asked no questions about which you mention in your statement. First about safety lamps : is it the custom, as I am told it is in Wales, that the hewer gets more if he works with safety lamps than naked lights ?—I am informed so.

21178. Therefore the men themselves would have no objection. It is not so pleasant working with a safety lamp, but at the same time, if they get the equivalent in wages, they probably would raise no objection ?—I have never had any objection raised by the men at all.

21179. You say that safety lamps should be introduced into all mines where the Government inspectors think that there is the slightest danger of explosion. You would leave it in the hands of the Government inspector without any appeal on behalf of the manager to the Home Secretary? —I think such a serious matter as the danger of explosion should be left to the Government official.

21180. That is not in your Bill. About obtaining a fresh enquiry, you make rather a drastic recommendation on the last page of your statement. You say: "Where, however, a serious accident has occurred, and where there may be doubt as to the searching character of the enquiry, it should be open to those interested to claim and obtain a fresh enquiry." What do you mean as to the searching character of the enquiry. Do you mean at the inquest ?—Yes, that is the public enquiry, the Fatal Accidents Enquiry in Scotland.

21181. Where there has been a fatal accident anybody who feels that there is any doubt as to whether all the circumstances have come out, and who is an interested party, might obtain a fresh enquiry. What do you mean ? Do you think one person interested ought to claim, as of right, a fresh enquiry ?—I should think in the matter of fatal accidents the representatives of the deceased should be the parties most immediately interested in making a claim of this kind.

21182. In your Bill application in writing must be signed by six workmen requesting the Secretary of State to make an investigation. Do you think six workmen ought to be the proper tribunal to decide ?—The men employed in the mine where the accident has occurred, I think, are interested partly, as well as the representatives of the deceased, and they ought to have a right to interfere in matters of this kind.

21183. Supposing there are a large number of persons working in that particular pit, 1,000 people, for instance, or something of that sort, do you think it ought to be sufficient if six said there ought to be an enquiry ?—I think it ought to be representative. That is quite enough to burden a document with, six men, if representative in their character.

21184. Supposing the other workmen in the mine were to express themselves as satisfied with the results of the enquiry, would you allow a counter-petition to the Secretary of State ?—We could not help that.

21185. They might, of course, petition if they like. Under this Bill that petition would have no effect, because the Secretary of State would be bound to act if six men asked for an enquiry. It would be a serious thing to have an enquiry if it was not necessary, because men would have to go as witnesses, which would be a nuisance, especially if the great majority of men were satisfied ?—I presume this clause is purely to protect the men where an enquiry has taken place, and a source of danger is still continuing, and at that enquiry the facts have not been elicited so fully as to bring out that source of danger and bring about its being done away with.

21186. I was suggesting whether it was not rather a considerable power to put in the hands of six men, to compel the Secretary of State to have an enquiry over again into all the circumstances of the accident ?—It is undoubtedly a big power.

21187. (*Mr. Ratcliffe Ellis.*) Supposing the Coroner's Jury censured a manager, would you allow him to have a further enquiry ?—There would be no objection if he felt aggrieved.

21188. If he was committed for manslaughter he would have a Court of Appeal ?

21189. We should have a Criminal Court of Appeal established. In Mr. Ronaldson's evidence with reference to lamps he is asked at *Q.* 5,089 : "Do you try to persuade the owners and the men to use safety lamps ?—Do you try and combat the prejudice of the men against safety lamps ?—(*A.*) There is a prejudice. (*Q.*) Do you try to combat it and talk to the men about it, and try to get them in a more reasonable frame of mind with regard to safety lamps ? (*A.*) I cannot say that I talk very much to the men about it, but I know it is a fact that they do object to them. As a rule if safety lamps are introduced the men expect 2d. per ton more on their coal, and the owners naturally object to it, although I must say that where safety lamps are introduced they put out as much coal with the safety lamps as with the naked lights." Do you agree with that ?—As to the men having a prejudice against it ?

21190. He says they have a prejudice and require 2d. a ton more although they put out just as much coal with safety lamps as without them ?—As to that I cannot form an opinion, as to whether they do it or not. We have in our district something like 1,000 lamps in use, but we have never had any difficulty about deduction from the extra price paid for the extra work, or anything of that kind.

21191. The extra price has been paid when it has been asked for ?—I understand it is always paid, and it has been paid.

21192. (*Mr. Smillie.*) With regard to the increased number of inspectors, I suppose you have in your mind quite a number of collieries in your own district which you feel do not require the same inspection as other collieries ? —That is perfectly true.

21193. Colliery inspection and mining legislation generally have been made necessary because of carelessness and indifference in some cases, and not from universal carelessness or indifference ?—It would be a pity if it had been universal carelessness.

21194. I mean some mines might require to be inspected four or five times a year, while others would not require to be inspected at all, because of their nature and the management thereof ?—That is true. If the manager is negligent and does not carry out the regulations of the Coal Mines Regulation Act, and there are complaints made against him, inspection would have to be frequent, and would be frequent.

21195. The miners and you do not propose that periodical inspections, half-yearly or yearly, must be made whether or not there is any occasion for them to be made ?—No.

21196. We might take it a large number of mines would not necessarily be inspected more, merely because you increase the number of inspectors ?—Not necessarily.

21197. If you had more inspectors it would make sure that an additional number of surprise visits would be made to the collieries ?—Undoubtedly that would be so, because you would have a greater staff of men to make them, and if these additional inspectors were making surprise visits there would be less need for inspections under Rule 38.

21198. Do you think that one inspection by the Government mines inspector is of far more importance than two or three inspections by the workmen's representatives ? —I think it has a greater effect.

21199. You frankly think increased mines inspection by Government inspectors would lead to greater safety ?— I do.

21200. (*Mr. F. L. Davis.*) In answer to Mr. Smillie you said some mines would not need to be examined as often as others. Is not that so ?—That is so, well-conducted mines.

21201. Why not ?—Because well-conducted mines are not so much in need of being looked after as mines which are not well-conducted.

21202. Under the present system of inspection we get it that an inspector can only examine on an average each mine once in a year. Therefore the sample of inspection of these good mines must have satisfied him everything was all right ?—Some inspectors are easily satisfied.

21203. You yourself say that some mines would not require to be examined ?—That is so. Some mines require more attention, so far as inspection is concerned, than others. I am going back now probably about 17 or 18 years ; there was one mine that we discovered that was very bad, and I gave instructions to have that examined by the men. The management pleaded with us to allow that to stay over a fortnight until they put the mine right. They did so, and we found after the examination was made that mine was in good order. I say this mine ought to

Digitized by Google

have been inspected by the Government inspector and not by the men.

21204. The present inspectors act upon that principle ?—If we make a complaint they will.

21205. They know themselves the mines that require more inspection or more frequent inspection than others ?—Yes.

21206. And they visit them more frequently for that reason ?—I do not know whether they do or not. I could not say as to that ; I could not tell.

Mr. DAVID GILMOUR, called and examined.

21207. (*Mr. Smillie.*) You are at present the Secretary and Agent of the Lanarkshire Miners' Association ?—Yes.

21208. Previous to your appointment to that position you were working underground ?—I was.

21209. And consequently you have a knowledge of underground mining ?—I have.

21210. Has your experience led you to think that the number of inspectors for mines is not sufficient at the present time ?—It is totally inadequate for systematic inspection.

21211. You are anxious that there should be an increased number of inspectors appointed, and that they should be, so far as possible, drawn from the ranks of practical men ?—Yes.

21212. Is that the general opinion of Scottish miners, so far as you know ?—The universal opinion, so far as I know.

21213. Is there any regular or systematic inspection of mines at the present time ?—There is not that I know of, apart from the ordinary morning inspection, and the ordinary inspection carried out by the fireman.

21214. Is there any regular or systematic inspection attempted by the Government inspectors at the present time ?—None.

21215. If there is anything called to their attention in reference to carrying out the Act, they attend to it ?—Yes.

21216. And in the case of a fatal accident, or explosion, they examine the part of the mine in which that has taken place ?—Yes, and a considerable amount of time is taken up in attending to that, and giving evidence before the court in such a case.

21217. So that you feel that the inspection by the present staff of Government inspectors is not satisfactory ?—It is not.

21218. And you are favourable to the appointment of an additional number of inspectors, and that they should be drawn from the ranks of practical working miners ?—Yes, and I think if that were done the number of accidents would be reduced.

21219. You are conversant with General Rule 38, which gives the miners the right to appoint inspectors from their own ranks to inspect the workings ?—Yes.

21220. In connection with that, you say that they should have the right to appoint persons who are or have been practical working miners ?—Yes, and my reason for that is this : that if the workmen in the colliery appoint two of their number to make a local inspection, those men are dependent upon the colliery company as a rule, and if they discover danger and put it into the report book, it carries with it the fear that they might lose their employment by-and-by, and that influences the men to a great extent in carrying out the local inspections. The same thing applies to local inspectors who may be drawn from some other pit. The feeling the men have is that if those inspectors, drawn from some other pit, make it too difficult for the manager of the colliery company, then information can be sent to interfere with their employment ; and as there are so many things in respect of which a miner can be interfered with, whilst it is a comparatively good thing as matters stand at present, I say it is very far short of carrying out the work which we believe to be necessary.

21221. I suppose, if persons who had been appointed as inspectors and made an examination were dismissed because of an adverse report, action would be taken at once by the trades union to protect them ?—Just so ; but the difficulty is that men can be dismissed sometimes on frivolous grounds which a trades union cannot get at ; there are so many ways of getting at a workman in connection with a coal mine that it is impossible almost to protect him.

21222. Persons might be unfairly dealt with up to the point of leaving the employment without any direct dismissal, and it would not be easy to protect them in a case of that kind ?—That is so.

21223. And there is a fear of that kind at the present time ?—Undoubtedly.

21224. The Lanarkshire miners some time ago decided to pay for the inspectors' loss of time and wages. Has that been taken advantage of largely?—Not universally, but it has been taken advantage of to a greater extent than any previous movement of that kind, I think, in Scotland.

21225. Have you had reports sent to you from those inspectors ?—We have. I may say it is a condition of our scheme in Lanarkshire that they must send reports of every inspection which is made, so that we have the reports of every inspection made in the county by local inspectors.

21226. You are aware that where any fault is found with the condition of the mine, that the colliery manager must send that report on to the mines inspector ?—In the first place the local inspector must put that report in the report book at the colliery ; and if there is any report of danger in that, then the onus falls on the colliery manager to send on the report to the mines inspector. I have found, in several cases, that has not been done. Only the other day I had to call the attention of the mines inspector to one report in which danger had been reported, and he replied to say he would attend to the matter, which was quite as much as to say he had not heard of it before. One would assume, therefore, it was in the books, but it had not reached the inspector apparently.

21227. May we take it that during the past six months you have had sent on to you the reports of pit inspectors, in which in six or eight cases there has been fault found with the condition of the mine, or some part of the mine ?—Yes, at least that number.

21228. Principally as to ventilation ?—Ventilation complaints are very frequent.

21229. And dangerous stones in the main roadways ?—In the case I referred to a moment ago the complaint was twofold : first, with regard to a dangerous stone insufficiently propped, and secondly, that the ventilation was insufficient in three or four sections. That is my memory.

21230. Has that been attended to at the present time ?—I had a reply saying it would be attended to at once, and since that I have had no further report. That was nearly four weeks after the inspection had been made.

21231. You think that generally this inspection does good ?—Yes.

21232. And the scope of it should be extended by enabling the miners to appoint persons who are or have been practical working miners ?—I do.

21233. That would give an opportunity to the men in the district of appointing two persons who could examine ?—Men should be got who would not be dependent upon the coal owners in the district for their labour.

21234. Then as to the inspection by the firemen, the miners assume that the colliery fireman holds a very important position ?—They do.

21235. I think your district is in what is known as a fiery zone, where the collieries are wrought with closed lamps ?—Yes.

21236. The position of a fireman there is a very important one in view of the fact that there may be accumulations of gas from time to time ?—That is so.

21237. Have you any idea as to whether or not the greatest care is taken in the selection of the men to fill that post ? Is the best man always selected, so far as your opinion goes ?—Generally I believe the best men are selected ; but there are cases in which that does not apply. My attention has been drawn to the case of men having been appointed as firemen who had none or very little previous knowledge of mining at all in the Hamilton district ; but I should say that generally the employers employ men that are able to do the work.

Digitized by Google

Mr. D. Gilmour.

11 June 1907

21238. Generally speaking, the firemen are competent, skilled, experienced persons ?—That is so.

21239. But there is nothing at the present time to prevent the manager appointing persons who are not competent ?—Nothing at all.

21240. With the exception of this, that the Act says " a competent person appointed by the manager " ?—Quite so.

21241. Do you favour the examination of firemen for a certificate ?—I think it is only a sensible reform which there can be nothing at all against.

21242. Have you any idea as to the extent of the district to which firemen are appointed and upon which they have to report ?—Generally, I should put it that a fireman has more to do in his morning inspection particularly than he is able to do thoroughly. For instance, he may go down the colliery at four o'clock in the morning, two hours before the miners have to descend ; he must have his inspection completed, and very often he has a very wide section to inspect. In many instances it is absolutely impossible that he can perform his work in a proper manner. The afternoon inspection is different, because he is on duty all day, and he can make his own time for that inspection. For the morning inspection I do not think he is able to carry it out properly, as things stand at present, in many instances.

21243. Do you remember what his duties are under the Act for his morning inspection ?—To examine the whole of the roadways in the workings particularly referring to gas, to certify that the places are free, that the travelling roads are free within his section, and as a matter of fact everything—both the timbering and the general safety of the workings it is his business to certify before he allows the miner to go to his working place.

21244. So far as you know it is not possible for him to make the statutory inspection under the act in the time at his disposal ?—I do not think in the morning it is possible, in a great many instances.

21245. Are the firemen's duties in Lanarkshire generally confined to ventilation and looking after the men at the face ?—No ; that is the exception. The fireman's time is taken up very largely in doing other work. There are some cases in which the firemen do nothing but look after the ventilation, but that is the exception I should say. The rule is that the firemen would do other work in the course of their ordinary occupation.

21246. What class of work ?—Timbering, for instance, and any odd jobs that may be necessary in the case of mining.

21247. Have they anything to do with the supervision of the pony drivers ?—Yes, they are put as overseers, as it were, over the drivers to see that the men get what we call " cleek," and that the tubs are kept going gradually.

21248. Are they held responsible for the output of some of their sections ?—In some cases they are, but I would not put it that they usually are.

21249. That interferes with their duties in looking after the safety of the workmen at the face ?—Yes.

21250. (*Dr. Haldane.*) Do you mean that the firemen themselves are really supposed to do timbering sometimes ? —Yes.

21251. Not merely to supervise it ?—To do it themselves.

21252. (*Mr. Ratcliffe Ellis.*) In the face or in the roads ? —Anywhere—to do any odd work that may be necessary in the mine.

21253. (*Mr. Smillie.*) Is it in the face or the roadways ? —Not at the working face, in the roadways, what we call on-cost labour.

21254. I suppose there is a considerable amount of mechanical haulage in your district ?—Yes.

21255. There have been a number of accidents arising from breakage of couplings and haulage ropes all over the county ?—Yes ; not very frequently. There have been a number, but they are not very numerous.

21256. It has been suggested that in the case where trains and tubs are carried along by mechanical haulage there might be a continuous chain, or some method by which there should be something over the top of the hutches, or along the bottom, to prevent their running back in the case of anything breaking. Do you think that that should be compulsory ?—Certainly ; I think that should be compulsory.

21257. Do you favour some method of either blocks or runaway points, or a slip rail in order to derail the hutches in the event of a rope breaking on the haulage road ?—Yes, I think ordinary precautions of that kind should be taken ; but of course the haulage varies so much, according to the seams in the different pits, that I think it is a matter for engineering experts to go carefully into and draw up rules that should be compulsory.

21258. Now let us deal with the question of unskilled labour in mines. I think in Lanarkshire there is the largest proportion of unskilled foreign miners that there is in any part of Scotland : almost the whole of the foreign mining population live in Lanarkshire ?—Yes.

21259. Have you any idea of the number ?—About three years ago we sent out for returns from our own local officials, and they had great difficulty in getting accurate materials ; but at that time we had in Lanarkshire considerably over 2,000 men, foreigners, and they were mostly all Polish miners.

21260. Out of what number ?—Out of 32,000 employed underground.

21261. Have they had any experience of mining before coming to Scotland ?—I think it is generally admitted they have not. They come from agricultural districts in Russia and Poland, and some of them have not seen coal pit before, and do not know anything about it. I may say they are brought over here by relatives, and one man may bring four or five over for the purpose of making a profit from them. Certainly the great majority have no previous knowledge of coal mining at all before they come into Lanarkshire.

21262. Many of them select remarkably Scotch or Irish names, do they not ?—They nearly all select a Scotch name immediately after they start work. As a matter of fact at a pit at which I was checkweigher some of the miners, for a joke I believe, called one of the newcomers, when he was asked to give a name, by my name, so that he took my name, after his first shift. It is quite a regular thing for them to take up some ordinary workman's name.

21263. I take it from you that the name they select is the name put into the colliery office book ?—Yes.

21264. That is, a person bearing a most unpronounceable name to us, may, on the first day he goes down a pit, secure a very plain name when he comes to the pit bank ?—Yes.

21265. And that name may go into the office ?—In almost every case that is so.

21266. And the manager of the colliery would not know that that person is a Pole ?—Unless by conversation. The manager of the colliery must have a record from the fireman or overman ; but by the names in the books it would be impossible to tell.

21267. Can you suggest a method by which a manager could have a conversation with them of some sort ?—There is no method, because not understanding their language he cannot converse with them.

21268. What I want to point out is really this : that accidents may occur, and do as a matter of fact occur, to foreign workmen, and it is impossible to find out the proportion that occur to foreign workmen, as compared with others, because of the fact that they take local names ?—That is so.

21269. Do you know whether or not it is true that the manager and the overman in many of our collieries in Lanarkshire are not aware of the changes which take place between those foreigners, that some may leave and others come and the manager knows nothing at all about it ?—Only about a fortnight ago a manager himself made that statement to me. He said " It is nearly impossible to prevent them ; they are in the habit of having strange men with them, and unless the attention of the overman is called to them, they may be working a good few days before it is detected." It is admitted they get into the pit without the cognisance of the overman, and that is a breach of the Mines Act.

21270. Is it possible for a workman who has been there some years to employ three or four, or even as many as 12, under his supervision ?—That is generally so at first, and it is continued until the newcomer learns a little of the language, and when he begins to understand the condition of affairs, then he blossoms out into a contractor himself and does the same thing. These men have been getting a low wage in their own country, and they are content to work for as little as 2s. a day for a fellow countryman, and they still continue that until they find out that they are being exploited.

Digitized by Google

21271. Do you know the Bothwell Park Colliery which belongs to William Baird and Company ?—Yes.

21272. Is the general manager Mr. Forgie ?—Yes.

21273. Have you any idea what proportion of foreign workmen are employed at that colliery ?—In the course of my work I have met these men a good many times, and the system of carrying on the work is generally to have a short meeting in the morning so as to get the men as close to the pit as possible and then speak to the whole number of them. They arrange themselves on two sides, the British worker and the foreigner, and without any exaggeration I should say that three-fourths of the men were Polish miners. They were reduced last year, but at the present time my information is from the check-weigher that more than 50 per cent. of the men employed getting coal at the coal face are Polish miners.

21274. Do you think that the employment of those men in the Scottish mines leads to greater danger ?—Undoubtedly, especially in fiery mines.

21275. I suppose there would be difficulty in preventing that ?—Very great difficulty. We have had statements made to our executive committee in connection with one case, which I have no reason to doubt, that two Polish miners working in one place were made to understand that they could not go into their place that morning because it was dangerous, and they took them into a different place and left them there. They found the coal there more difficult to get, and in the course of an hour or two they left that place and went back to their own original place—the dangerous place—and the fireman discovered them there and put them out, and he had to do that three times in the course of one shift. Our information was from the fireman. He reported the matter, according to his statement, to the manager, but nothing was done, and it simply ended with that. Of course, if that had been made public property, in the way of getting into Court, the fireman would have been at the mercy of the employer, and might have lost his situation. I have no reason to doubt the truth of the statement.

21276. There have been cases in the Law Courts from time to time in which foreign workmen have been involved. There was one about a fortnight ago decided in the Court of Session here in Edinburgh in which the compensation had been refused in the case of a fatal accident to an overman at the Glenboig fireclay pits. The insurance company refused compensation on the ground that he had allowed a Polish miner to go into a place in which there was gas, and the result was an explosion was caused, and the overman lost his life. The judges held that he could not protect himself so long as the employers allowed that sort of thing, so that they overruled the objection and gave compensation to the widow on that ground.

21277. You are opposed to the employment of unskilled foreign workmen in the mines who do not understand the language ?—Yes.

21278. Not on the ground of any objection to the men themselves, but they do not understand the language and they are a source of danger to the other men underground ?—Yes, that is so.

21279. Now, on the question of drawing up Special Rules: do you know whether or not the Lanarkshire miners, or their representatives, have at any time been consulted in the drawing up of Special Rules ?—They have not.

21280. Do you think that they should be consulted with respect to the drawing up of Special Rules ?—I think so. I think if the miners were consulted they would have greater interest in seeing that they were carried out more strictly. Half the responsibility would be on the miner to see that the rules were carried out. As things stand at present the rules are posted up at the collieries, and a miner has scarcely any time to read them—I should say not one in a hundred would carefully read them—with the result in a great many cases they have been ignorant of the nature of the rules until some accident takes place, when the whole subject of course at that time is threshed out. I think it would be more satisfactory if in drawing up timbering rules the workmen were consulted.

21281. Or in reference to any other Special Rules ?—Yes, in reference to any Special Rules.

21282. You think if they were consulted through their representatives there would be in all probability more care taken in carrying out rules which were mutually agreed upon, if there can be mutual agreement upon rules ?—I think there would be.

21283. The latest timbering rules which have been adopted have not led to any great diminution in accidents ?—No. I do not think that the rules have been very strictly carried out. In some cases it is very difficult to strictly carry them out to the letter, and I must admit that that is through causes over which the workman has not sufficient control. There is not sufficient care exercised to see that they are carried out strictly.

21284. Is there not a feeling amongst the workmen in Lanarkshire that some of the special timbering rules, if carried out, would render it almost impossible to carry on mining there ?—That is so.

21285. And to some extent they are a dead letter ?—They are not observed, and the employers know in many instances that they are not, and they never try to enforce them.

21286. Now I will ask you about the duties of the winding enginemen. I suppose as mines are extending there is greater responsibility on the services of the winding engineman ?—That is so.

21287. Do you favour a winding engineman holding a certificate of competency ?—I think it is very necessary.

21288. You are aware that under the Act the manager is supposed to appoint a competent person ?—That is so.

21289. Do you know whether or not he makes any test of the ability of the person whom he appoints, or does he usually take it for granted that the person appointed is a competent person ?—Generally, of course, the men appointed are competent—they could not do the work unless they were—but there are cases in which men have been appointed to fill a gap, as it were, who were not competent. For instance, officials about a colliery who have a slight smattering of knowledge about engine-winding have been appointed to take the place of a man who has had a dispute.

21290. You agree with practically everybody that the colliery engine-winders of Great Britain are an exceptionally fine class of men ?—Yes.

21291. And no fault can be found with the vast majority of them ?—None whatever.

21292. Have you ever known of what is called the "tramp" engineman ?—Yes.

21293. Is he a pretty common person in Scotland ?—We had a case in the upper end of the Larkhall district some time ago, in which two or three of the enginemen were affected, and the management got such a man to take the place, and the men refused to work. We had no responsibility and we did not support them, because we had not anything to do with it, but the miners, being in fear through being in the hands of an unskilled man, refused to work.

21294. A manager being in that position might not be too careful in his selection of what he would feel to be a competent person ?—Naturally he is anxious to get coal, and he risks something.

21295. Of course a certificate would not always carry with it a guarantee that the man was the best possible man, but it would prove that he had passed an examination ?—Yes. I think the holding of a certificate should be compulsory.

21296. At some collieries there might be 30, 40, 50 or 100 men in the shaft at the same time, and their lives might depend upon the competency of the engine-driver ?—Yes. In very many instances the duties of the engine-winder require him to be a practical, steady, temperate man. He is standing there almost like a machine for 8 or 10 hours at a stretch, especially at large collieries where the output is great.

21297. I suppose some of the members of your Association, and the men in your county, are sometimes guilty of a breach of the Mines Act ?—Yes.

21298. And they are charged before the court with it ?—They are.

21299. You have no system of fining for breaches of Special Rules or breaches of the Mines Act ?—There is no system of fining, although I have heard it said that the managers, in order to have their ideas of discipline carried out, instead of raising a prosecution, have taken the workman into the colliery office and asked him to agree to pay a fine, which fine, of course, is paid over to some charitable institution, rather than go into court.

21300. Is that for a breach of the Mines Act or some slight breach which might have been a danger to his own life ?—Something like that. For any serious breach, generally speaking, I think the employers would raise a prosecution.

Mr. D. Gilmour.

11 June 1907

21301. Has your Miners' Association, so far as you know, ever defended workmen who were charged with a breach of the Mines Act?—We have not.

21302. As a matter of fact, is it true that you have decided not to defend any workman in such a case?—That is so. The Executive Committee—it does not matter what the charge is—have always refused to take up any such case. We have had a good many appeals to us to do so. For instance, the workman has come to us and said the charge was very unfair, or it was through spite or malice, and argued from that standpoint and asked us to defend him, but we have refused. We have simply resolved that where a workman is charged with a breach of the Mines Act we do not defend him in any way.

21303. Of course, if it was perfectly clear that a conspiracy was on foot against a person, and you had good grounds for thinking he was not guilty, and he was a member of your union, you might undertake to assist him in a case of that kind?—We might, of course, but we have never been called upon to do that. In the cases that have been reported to us there is just the word of the workman as against the manager at the colliery.

21304. You do not encourage breaches of the Mines Act?—We do not.

21305. And you would not spend the union's money in defending them if they were guilty of a breach?—Quite so; we believe it is as much our duty as it is the duty of the manager at the colliery to insist on the Act being properly carried out.

21306. (*Sir Lindsay Wood.*) I think you said one reason for not carrying out Rule 38 was for fear of offending the management?—Yes.

21307. Have you any particular case of that?—I said that it was a most difficult thing to get proof of that kind, but the workman, knowing in mining how easy it is to punish him, is afraid to do that work thoroughly. As a punishment he may be put into a place where the coals are hard to get, and he may not be able to earn near the standard wage. That is a form of punishment which it is very difficult to get at.

21308. Do they not draw lots for their places?—There is nothing of that kind in Scotland. It is a case of individual bargaining in circumstances such as I have mentioned.

21309. You do not know any case in which the men who have made the examination have been punished?—I do not say that we could prove any case of that kind.

21310. You have a suspicion that there might be something of that kind?—Yes, there is the fear of the workmen. The workmen generally are afraid to make a very damaging report against the manager at the colliery if they make an inspection. As a matter of fact I had a case reported to me in which two of the workmen appointed to inspect the North Motherwell Colliery belonging to Messrs. Merry and Cunningham sent a report to the office in which they said there had been bad ventilation in several places, and that it was dangerous pretty generally. I drew the attention of the mines inspector to that point and had the reply that we had a different report sent to us from what was put in the colliery book. I investigated that, and found that the colliery book had been entered up as being all right and safe. That was a case in point in which they sent on the statement through ignorance, I suppose, that it was their duty to send a copy of the statement they put in the colliery books. That is a case in which a different report was sent to us.

21311. It might be the other way, that a different report was sent to you to please your side?—I think the workmen would know as a matter of fact. We are always better pleased to get reports showing that there is no danger.

21312. Is not the owner pleased if the men go round the pit and he gets a report that everything is safe?—That is so; if a report is put in the report book showing that the pit is generally unsafe, the manager is held to some extent to blame for that.

21313. The management would be only too glad to know, if that was so, because it would reflect on the officials under the general manager?—I frankly admit that the majority of the managers do not put any hindrance in the way of the men carrying out their duty properly. We are not able to prove anything except the general feeling that the men are afraid on account of the chance of getting at them with their daily labour. They are afraid to put in a damaging report in the book.

21314. You said that the reports were not sometimes sent to the inspectors?—I instanced a case in point.

21315. That was only supposition?—The mines inspector in his reply to me admits that, because the inspection was made three or four weeks ago, and when I sent on a copy of the report he writes back and says the matter would be attended to, clearly proving that it had not been up to the present time.

21316. That does not say the report had not been sent. It does not show a breach of the Act by the owner?—My experience of the Government inspectors is this: when their attention is called to danger in a mine it is attended to at once. I do not know of a case in which that has not been done.

21317. There were no steps taken with the management for not having sent that report on?—None yet; there may be later on.

21318. It only occurred just lately?—Yes, within the last fortnight. I have the reply from the mines inspector.

21319. Generally speaking, do you think that the firemen are competent men?—Generally speaking, they are.

21320. There might be improvement if they had less work to do, other than the inspection of a mine?—I think they would be able to do the work better if not overloaded with other things.

21321. Do you think that the number of the Government inspectors ought to be increased?—I certainly do.

21322. Would you have the districts under the head inspector increased?—No, I think that the district inspectors have too much to do already.

21323. You would increase the districts, and instead of one have at least a number under them?—I think so.

21324. That would tend to safety in the smaller districts?—I think that would tend to safety.

21325. Instead of having a large number of assistant inspectors?—Both things. I think it is an absolute necessity to have a considerable number of assistant inspectors for the work to be properly carried out.

21326. The last witness told us he thought that there ought to be one inspector for every 10,000 men employed in and about the mine?—I think that would be sufficient work for an inspector to do.

21327. One inspector?—One inspector to inspect mines in which 10,000 men are at work. Do you mean without assistants?

21328. I am referring to Clause 7 of your Bill?—I think that one inspector who is responsible for looking after 10,000 workmen has too much work. I do not think that the inspection can be properly carried out to cover such a large number of men, more especially in the pits in Lanarkshire, because there are a very large number employed as a rule in each pit.

21329. How do the Polish men come over so much to Lanarkshire?—I do not know. They are located there to begin with, and then they send for relatives and tell them what an Eldorado this country is. They get them to work for low wages and make a profit on them, and so they go on increasing.

21330. They were not brought over for any special purpose?—Not in coal mining.

21331. (*Mr. Ratcliffe Ellis.*) Were they not brought over in connection with another industry?—Yes, with Furnaces. So far as disputes in coal mining are concerned, they have not been brought over.

21332. (*Sir Lindsay Wood.*) The management did not know that Polish men were employed?—They admit that.

21333. How were the men employed?—As a rule the manager of the colliery does not interfere in the matter of employing the workmen He leaves it entirely to his overman, the under-manager. He employs and dismisses all the men. The manager does not interfere in the work.

21334. The under-manager knows?—Yes.

21335. (*Mr. Smillie.*) Do contractors employ workmen without the knowledge of the manager sometimes. Could he not employ the men?—Yes, but as a rule coal contractors do not employ Polish miners.

21336. A Polish coal contractor?—The Polish contractor I refer to is not a contractor who is recognised by the colliery company, he is only a man who may get the material put into his name and pays the workmen anything he likes. The company do not know about that; they do not let out a contract to a Polish miner. I do not know a case in our county.

21337. (*Sir Lindsay Wood.*) How does the man get the money for the Polish miner? Do they not draw their own

Digitized by Google

wages ?—It is the custom in Lanarkshire, where there are four men working together in one place, double-shifting, that all the four men's material goes into one man's name, and they divide the money.

21338. They are contractors ?—That is not contract really. Instead of having each individual miner's name on the paybook, they may have one name for four workmen. That is left to the men's own free will.

21339. Instead of dividing the money amongst the four, one man gets over so much less ?—That applies in the case of the Polish miner who comes to learn the language. When his countryman first comes who is used to 1s. a day, he thinks he is getting on all right if he gets 2s. If he earns on an average 6s. and pays 2s. to the workman he benefits 4s. from the man employed. The colliery company do not experience any benefit from that. It is not to their benefit to allow that to go on.

21340. He must know it, I should think. It is rather a curious system ?—He takes it that it is not his business, and he does not interfere.

21341. You said that winding enginemen ought to have certificates ?—I think so.

21342. What certificates would you give them ?—A certificate of competency. They ought to be passed by some expert as being qualified men.

21343. You mean for someone to give a character ?—No, to test them as to their ability to work winding engines before they get a certificate of competency.

21344. You mean a practical test ?—Yes.

21345. Winding so many tubs a second or so many men a minute ?—I should not say that was desirable.

21346. I do not know how you can get a certificate. You can only get the opinion of a man who can give characters. You can only get a man to say, "I believe this man is competent." I do not know what examination he could pass ?—I think it would not be an impossibility for the Government to carry out a system of examination to give men qualifying certificates.

21347. The Government would want to know what examination he has to pass ?—An examination as to his knowledge of the engine, to begin with, and his ability to do the work.

21348. Freedom from accident during a certain period of time ?—I do not know that that would apply.

21349. That is the difficulty. I do not see how you could do it. I want to know what sort of certificate you suggest. I am told that these men ought to be certificated, but I have not yet found out how they should be examined, or what examination they should pass ?—I could not go into detail as to the method of examination only in a general way, that we are of opinion than an engine-keeper, because of the nature of his work, ought to be certificated as a competent man, and that there should be some means for carrying that out. I believe through the Engine-keepers' Association that practical means can be devised for that, but not being one, and not having the practical knowledge, I could not go into those details.

21350. Under the present system there are very few accidents ?—That is to say, comparatively few.

21351. Then as to having a set of men who are not capable, is that at all due to restriction in the employment of the enginemen ?—No, probably the trades organisation when a dispute is on advise their members not to accept employment.

21352. Restrictions are put on to prevent a man coming into the employment ?—If there is a dispute on at the colliery.

21353. Without that ?—I do nct think the engine-keepers are able to prevent that as a rule. They do try to restrict the number of enginemen to see that the labour is not in excess of the demand. There are a considerable number of men, officials in other capacities, who do get to learn how to wind an engine ; at every colliery there are men who have a smattering of the work.

21354. They put on a certain amount of restriction for that purpose—I mean the enginemen ?—I understand that they do. I am not in touch with their organisation.

21355. I thought you complained that owners had to employ men who were not sufficiently practical ?—I should think there is a sufficient supply of practical men for ordinary purposes except in cases of dispute.

21356. You say that you are of opinion, where the employer is responsible to engage men specially to do the work of timbering and free the working miner as much as possible from this work, that the accident rate would be greatly reduced. Then, you say, "That only men who were duly qualified by certificate of efficiency should be appointed to carry out the duties defined in General Rule 4, and that those men should be responsible only to the Government for the due discharge of their duties." The firemen ought to be responsible only to the Government ?—Yes, those men could be utilised for making a system of daily inspection. We are of opinion, if they were left independent of employers and men, they could carry out their duties in a far more efficient manner.

21357. The Government ought to employ firemen at every colliery to make these inspections ?—That is our solution of the difficulty. That these men ought to be employed by the Government and paid as they are paid now at the expense of the colliery owner.

(*Mr. Ratcliffe Ellis.*) You are not speaking of the same thing. Sir Lindsay Wood is talking of ordinary firemen.

(*Mr. Smillie.*) The Witness is talking about the firemen.

(*Mr. Ratcliffe Ellis.*) You cannot mean that ?

(*Mr. Smillie.*) He does.

(*The Witness.*) I understood you were asking on the question of inspection under General Rule 4.

21358. (*Sir Lindsay Wood.*) I was asking about the firemen ?—We hold that the ordinary fireman should be a Government official. That has been our opinion for a long time.

21359. That would increase the number of inspectors very largely which the Government would have to employ ?—Yes. I think, however, under the Government inspectors that that could be carried out without any difficulty. They could be under the control of the inspector of the district.

21360. Under General Rule 4 of the Act, that means those men who have to examine all the working places before the men go in every morning ?—Yes.

21361. All those men would have to be under Government employment ?—Yes.

21362. That would mean a very large number of men ?—Yes, it would.

21363. Do you think that ought tc be done ?—In our opinion it would tend to safety, at any rate. It might be difficult to carry out, but it would be a very big step towards reducing the number of accidents.

21364. Who would be responsible for any accident occurring from these men ? The managers of the mine would not be responsible ?—They would be liable to punishment if it could be shown——.

21365. The manager of the mine could not be responsible for any man employed by the Government ?—If the Government official did not carry out his duty, I take it, you could in altering the Mines Act insert a provision punishing the fireman, who would then be a Government official.

21366. (*Mr. Ratcliffe Ellis.*) It is in the Mines Act now. Sir Lindsay Wood asks you whether you would relieve the manager from the responsibility of the fireman's negligence ?—Undoubtedly. I do not see how you could hold the manager responsible if the fireman were not under the control of the manager.

21367. Would that be in the Mines Act ?—I think it would. The manager would report any dereliction of duty on the part of the firemen to the inspector.

(*Mr. Ratcliffe Ellis.*) It would take a long time before he could prevent him doing anything of the kind.

21368. (*Sir Lindsay Wood.*) So far as the working of the mine is concerned the responsibility would be on the Home Secretary ?—Yes, on the Government inspector. We recognise this as being a very big question, and it may not be ripe for sclution yet. We have discussed it at our conference pretty frequently.

21369. (*Mr. Ratcliffe Ellis.*) Upon the question of the inspectors, the present provision of Section 39 of the Mines Act provides : "A Secretary of State may from time to time appoint any fit persons to be inspectors (under whatever title he may from time to time fix) of mines and assign them their duties and may award them such salaries as the Treasury may approve, and may remove any such inspector." That would enable the Home Secretary to appoint any number of inspectors he thinks fit ?—That is so.

21370. Have you any fault to find with the calibre of the inspectors now appointed ?—None whatever with the inspectors so far as I know in Scotland.

Digitized by Google

Mr. D. Gilmour.

11 June 1907

21371. Do you want to make any legislative alteration in that, or would you be satisfied if the Government appointed more inspectors?—We think that it would be more satisfactory if the assistant inspectors were drawn from the ranks of practical men, men who had gone through all the grades of mining.

21372. Which class down the pit do you suggest that they should be selected from, the men who work at the face or the men who work at the roads or the firemen?—I should think that either of these men would be quite capable.

21373. Do you think a man who has worked at the face and is a thoroughly experienced, practical miner is the best man to appoint to be an inspector?—Yes; I believe there are hundreds of those men who have qualified to be appointed as inspectors.

21374. Would you say that the qualification should be that the miner has worked at the face?—No, that he has had a general practical experience of mining.

21375. For how long?—The time that is specified in the Mines Acts.

21376. Five years?—Yes.

21377. What objection have you to any class of persons who have got that experience being eligible for these appointments?—I should think in going round inspecting the working place that the workmen would be more ready to give all information to a man they knew had practical experience than they would to some of the men appointed as things stand now.

21378. Do you think that any workman would withhold information necessary for safety upon that ground, because he was not one appointed from their class?—Statements have been made that workmen are afraid to report danger to the inspectors. I do not know that it has any foundation, in fact, but there is a general feeling that if a report is given to an inspector it somehow or other reaches the colliery manager.

21379. Do you think there is anything in that which requires serious consideration?—I do not think there is much in that objection. I believe that instances may have occurred.

21380. If a man has had five years' practical experience, which he must have to get a certificate, you would not exclude that man from the position of inspector because he belonged to a particular class?—No, but I should think, in appointing inspectors, that it would be an additional qualification if he had practical experience in general mining.

21381. Do you know any inspector who has worked at the face with whom you have no fault to find?—Yes, one in Scotland has worked at the face.

21382. Who is that?—Mr. Pearson.

21383. Mr. Ronaldson has not worked at the face?—No.

21384. Nor Mr. McLaren?—I think Mr. McLaren, the present chief inspector, has worked at the face.

21385. We should agree, if a man has had thorough practical experience, it does not matter what class he belongs to?—No, that is so.

21386. You do not think that inspection now is sufficient?—I am convinced of that.

21387. Your two inspectors disagree with you in that view. Mr. McLaren was asked a question: "Do you consider you can do justice to your district in the way of inspection—I mean that it is not too large? (A). So far as the coal mines are concerned, I think, probably the inspection is quite sufficient, but it is utterly impossible to do full justice to the quarries. (Q). Then what would be your suggestion with regard to the quarries?—(A). The only thing would be to provide another assistant, if that were possible." There is a later question: "As regards the coal mines, do you consider that the underground inspections that you and your assistants are able to get through are sufficient?—(A). Last year we were able to manage for the first time to see all the mines, and to make underground inspections in all the mines," and that he considers sufficient. Mr. Ronaldson was asked similar questions: (Q). "Do you consider that you and your two assistants are competent to inspect the mines as much as you think it desirable they should be inspected? (A). Yes. (Q). And your inspection is as thorough as you think it is desirable it should be? (A). As thorough as it is desirable that it should be, that is to say, of course people have divided views as to what 'inspection' should be—according to our ideas of Government supervision I think it is quite sufficient." That was the view of the two inspectors, but you do not agree with them?—I do not agree with them.

21388. How often do you suggest that a mine should be inspected?—I should think once a month would not be too much for a general inspection.

21389. There are about 3,000 collieries in the kingdom?—Yes.

21390. It would want a large number of inspectors?—Yes, undoubtedly it would.

21391. A suggestion has been made by your friends that once in six months would be sufficient?—I do not agree with that; I do not think that would be sufficient.

21392. (*Mr. Ratcliffe Ellis*). You do not agree that inspection should be every six months?—No.

21393. Do you agree that the responsibility for the carrying out of the Act should primarily rest upon the management?—I agree with that.

21394. Do you think that the managers throughout the kingdom are so incompetent that they require to have somebody every month to see that they are carrying out their work?—A great many of the managers themselves, just like mine inspectors, have so many duties to perform that they are not able to be underground every day.

21395. Do you think it is possible to have too much inspection?—It might be possible to have too much inspection.

21396. What do you think would be too much?—I do not think once a month would be too much.

21397. (*Chairman*). I see in the Bill under Section 6 it says "In every district an inspector shall make a complete examination of every mine and every part thereof at least once in every six months"?—Yes, "at least." I think it is very moderate.

21398. (*Mr. Ratcliffe Ellis.*) With reference to inspection by the workmen in Scotland, do you know any reason why the men should be more afraid of their employers than in other parts of the kingdom?—No.

21399. In Northumberland and Durham are you aware that these inspections are frequently made by the men?—I have no knowledge of that.

21400. Would that alter your view as to what is the reason in Scotland?—I do not know. In Durham and Northumberland the system of working is different.

21401. You think the reason the men do not make the inspection is because they are afraid of reprisals?—We have not always found men to undertake the duty, although we pay for it.

21402. It is suggested by some of the inspectors that there is another reason. Mr. Ronaldson says at *Q.* 4980: "Do you suggest to the owners and the men that such inspection should take place?—(*A.*) I have suggested it, but I have been met with this reply—that the Government inspectors are paid for inspecting, and the men are not going to do it. I do not say that is the general feeling, but that is the reply which has been given when we have spoken about the matter"?—I have never heard such a thing.

21403. You do not agree with that?—No. In our case I never heard a reason of that kind being given.

21404. You want Government inspection once a month?—Yes, I think generally once a month.

21405. What is this inspection by the men to be for? Is that in order to do something which the Government inspector neglects to do, or in order to satisfy the men?—It is to do both things.

21406. Do you think a Government inspection once a month is not enough to secure safety?—No, a general inspection.

21407. An inspection by a Government inspector, perhaps I ought to say?—Do you suggest that should do away——

21408. I am asking, if you got your inspection by the Government inspector every month, what is the object of having inspection by the men?—If we get a daily inspection by the men, it might not be necessary to have so frequent Government inspections.

21409. Do you suggest that there should be an inspection by a Government inspector once a month?—Yes.

21410. What is the object in having, in addition to that, the right to have an itinerant inspector appointed, or two, by the men, to go through the different mines in the same district?—If we had the Government inspectors appointed,

Digitized by Google

that would do away greatly with the necessity for having both things. We would not require so much local pit inspection if there was systematic Government inspection once a month.

21411. Is the object of Rule 38 to secure the safety of the men or to satisfy the men that it is safe ?—It is to secure the safety of the men and to satisfy the men also.

21412. Do you not think for that purpose under Rule 38 that the best persons to inspect it would be the people who are actually working in the mine ? They would know more about the condition of the mine than anyone else ?—There is the objection which I have mentioned to you, the difficulty of getting those men to carry out the work.

21413. Subject to our getting rid of this terrible fear of consequences, do you think that those would be the best men for the purpose ?—Yes.

21414. Do you think that there is such a fear that reprisals might be made that you could not get the men at the mine to do it ?—We have difficulty just now in getting the men to do it.

21415. Do you not think you could get men working at another mine to do it ?—If they are working at another mine, information may be sent if they make themselves obnoxious. The managers may assist each other, and the workmen may be interfered with at another mine.

21416. You are saying first of all that the owner of the mine himself would do something serious to the men if they were in his employ, and if they were working in anybody's else employ the owner would communicate with that employer and induce him to make reprisals on the men ?—No, not the owner, the management.

21417. Well, the management. Have you any reason for thinking that is so ?—If I were a colliery manager it would be reasonable to expect it if a workman inspected the pits under my charge and made a point of going very minutely into the matter and showing up every point of danger : I think human nature would be such that I could not avoid having such feeling.

21418. That is what you would do ?—Probably.

21419. We will put it that probably the manager might not do it ?—I do not think it is probable.

21420. You propose that there should be what I call itinerant inspectors appointed, not necessarily men engaged in practical mining, but people who may at some time have been down a pit ?—That the workmen should have the right to select practical men who have the qualifications specified in the Coal Mines Act without being limited to selecting men at present working as miners.

21421. Who in your mine would be selected, and who would select them ?—There might be the men's representatives.

21422. You would not propose that the men at each pit should select their own representatives ?—There might be checkweighers appointed, for instance.

21423. The idea is that the Miners' Organisation should appoint some of their officials to make this inspection ?—No, that the workmen in a mine should appoint somebody they were satisfied with.

21424. I suppose that your mind is running on checkweighmen ?—That is one class of workmen at present in my mind.

21425. The checkweighman is the miners' agent. The miners' agent would be appointed for this work ?—A checkweighman is not a miners' agent.

21426. Very frequently I think he is ?—He may be.

21427. There are certain things he cannot do as a miners' agent, but assuming it is a miners' official, it would be an official of the miners' union ?—That is the only class that they can be drawn from.

21428. Assume a checkweigher or some official of the Miners' Organisation. There are not infrequently questions arising as to wages and other things between the management and the miner ?—Yes.

21429. You have said what you would do as a manager. I will put this to you ; if you were a manager, would you think it right that a miner's agent should come down the pit at any time he thought fit, and make any inspection, and have every facility afforded to him without any responsibility to anybody except the Miners' Federation ? —Not at any time of course, that he wanted, but within a reasonable time.

21430. How often should he go. Your Bill puts no restriction upon the time he is to go there. He can go whenever he likes : "Such examiners may at any time examine the mine or any part thereof or any old workings shafts machinery or apparatus connected therewith and every facility shall be afforded for any such examination by the owner agent and manager of the mine." Do you think it would be reasonable to impose upon a manager the obligation to allow the miners' agent at any time he thought fit to come down that mine under pretence of coming to examine, when he might have many other things in his mind ?—Putting it that way, I do not think that was what was contemplated.

21431. I put it in that way. Is that a fair thing to ask a manager to agree to ?—No, I should admit that it is not.

21432. What restriction would you put upon it that he should not use this power which is given him to the detriment of the employer, or for any purpose except *bona fide* examination into the safety of the mine ?—I do not see how he could use a power of that kind to the detriment of the owner. If he made an untrue report, that would be to his own detriment.

21433. I am not talking of a question of safety ; I am assuming he goes down and there is a dispute on, and. to put it plainly, that he makes mischief. He is not under any restriction, as a Government inspector is, not to use the information he gets. He is not responsible to anybody or to any Government Department, and he is under no obligation to the manager to refrain from using the information which he gets. What restriction would you put upon that ?—We have no experience of that kind in Lanarkshire. I should say that in 95 per cent. of our collieries the management at the present moment would have no objection to the miners' agent going down the pit.

21434. But the 5 per cent. might have a very great objection to it, and what you are proposing to do is that he should go there as a matter of right whether the manager likes it or not. Again, I call your attention to the proposal in this Bill that the result of his examination he must communicate to the workmen, and, if dangerous, to the inspector. There is no obligation on him to communicate the result of it to the management ?—I think that is a mistake ; there should be.

21435. Do you think, that this clause as it is in your Bill, wants very considerable revising ?—Yes, I think it would be open to revising.

21436. And this further, that this power should not be given unless it is subject to restrictions similar to those of a Government inspector, that the information should not be used to the detriment of the employer except on the ground of safety ?—It would be unfair that it should be used for any other purpose except safety.

21437. Now I want to ask you about the firemen. I see Mr. Ronaldson does not agree about these firemen. He thinks on the whole that they do their work pretty well, and he was asked if it was necessary that they should have certificates, and he said they would not be the worse for having them, but that he did not think it was necessary to make them compulsory. That was his view about it. Do you think generally that the firemen do their work satisfactorily ?—I have said so.

21438. It is only exceptional that they do not do so ?—Yes.

21439. The men who do the work satisfactorily now are not certificated workmen ?—No.

21440. Why do you think those men would be improved by having a certificate ?—Because in one individual case an incompetent man might be employed, and a serious accident result. We should all agree that we should have some protection against that.

21441. If a man is employed who is not competent, the management are responsible ?—Yes.

21442. Is that not a sufficient protection ? Do not you think for his own sake a manager would employ a man at any rate whom he believed to be competent?—Generally speaking, I think he would.

21443. It would be very exceptional. Do you think those very exceptional cases justify legislation such as you have suggested, that no man should be qualified unless certificated ?—Only upon the ground that it would give greater safety.

21444. With reference to the area, that could be altered. If the areas are too big they could be reduced ?—Yes.

21445. And further, that the work of the firemen should be confined to the purpose of inspection. That could be done without legislation at all ?—Yes.

Digitized by Google

Mr. D. Gilmour.

11 June 1907

21446. Do you think that in both those respects improvement might be made?—Yes, I think if that was done it would be a great improvement.

21447. Do the coal-getters often go from coal-getters to firemen?—I should think they do. Generally a large percentage of the firemen have been coal-getters. The coal-getter is a young man as a rule, and later on they may put him on to on-cost work, and then to be a fireman.

21448. When coal-getting becomes too hard work he becomes a fireman?—That is very often the case.

21449. With reference to these Poles, I see in the Inspector's report that he speaks rather well of them. I am referring to the evidence of Mr. Ronaldson: "(*Q.*) I believe there are a large number of foreigners who are working in your districts, are there not?—(*A.*) There are a good number of Polish workmen. (*Q.*) Do you think that they have any bad influence on the mines?—(*A.*) Not at all I have watched for years the conduct of those men; they are far more amenable to discipline than our own men. It is the universal testimony of the managers that these men are much more amenable to discipline, and that they will do what they are told. If they know that they are obliged to to a thing they will do it, and they are a striking contrast to a good many of our own workmen in that respect. I have only so far come across one case of a trifling accident, apparently, where one of those foreign workmen was the cause of another man meeting with an injury." Then the next question was: "Do you consider that the presence of those Poles has a good influence in the mine?—(*A*) I do not know whether I can go to that length, but they certainly are much more reasonable in carrying out the instructions than our own men, and I do not think their presence can be proved to be in the slightest way a menace to the lives and limbs of the rest of the workmen." That is the opinion of Mr. Ronaldson?—I disagree with that.

21450. What evidence have you except your own opinion?—I have no evidence that I could prove except my own opinion.

21451. How came you to hold that opinion?—I do not think in the first place it is commonsense to expect that a man who has never seen a coal-pit, and who does not know about the dangers of coalmining, can safely be sent down into a fiery mine with another man who, to put it at the best, has an imperfect knowledge of mining.

21452. That would not weigh against the opinion of the man who has watched these matters?—I do not see how he could. He only goes round once a year. How can he watch discipline as affecting workmen? I do not understand what he means.

21453. He says: "I have watched for years the conduct of these men"?—How could he? I think he must be making a mistake.

21454. Whether or not he is making a mistake do you not think that the view of a man who has been watching them for years is certainly as reliable as your opinion without any evidence in support of it?—My daily life is to a greater extent among them than his.

21455. Are these men in the Union?—Yes.

21456. But they work for less money?—They do not if we can prevent it.

21457. You say they do manage in some way?—Where there is a regular standard rate fixed we take care that they do not work lower than that if we can find it out.

21458. Your objection is purely on the ground of safety?—Absolutely.

21459. Is there a single accident which you can trace to the employment of these men?—I could not say that I could prove it, but the managers themselves have come to that conclusion. I can point to a colliery in the Blantyre district, Craighead Colliery.

21460. If you have not a case you can prove I do not think we ought to take the names you mention?—There is another, Cadzow Colliery. That is within 200 yards of where I live. The manager dismissed every Pole in his employment and for some years has not employed one, and that was on the ground that he believed them to be a danger to safety.

21461. What manager was that?—Mr. MacVie, of Cadzow.

21462. Do you think that that gentleman could say something about these Poles?—Yes, and there is another I would specify, one of Messrs. William Baird and Company's managers, Mr. Miller, of Craighead Colliery, Blantyre. He also has reduced the number of Poles. There used to be 50 per cent. of the men Polish miners, but now I think there are not more than 5 per cent.

21463. With reference to the Special Rules, did I understand you to say that you thought the miner would carry out the rules better if he had a voice in the making of them?—Yes.

21464. What voice in making them do you propose to give to the miner who has to carry out these rules?—He should get proper notice when the rules are under consideration, so that he could discuss them either through his trade organisation or——

21465. I can understand the trade organisation would do it, but so far as the miner is concerned I want to know how it would affect his observing the rules or not, because he would have no voice in the making of the rules?—By attending a meeting of his fellow-workmen at which the matter would be fully discussed, and if they had any objections they would raise them there.

21466. He would get information as to what the rules were by attending a discussion by his representative?—Yes, through some medium, I think.

21467. Why cannot the representative give him that information now?—They are posted up before the representatives know anything about them.

21468. These Special Rules have been established for years?—They are established now.

21469. Do you take pains now to instruct the men in these rules?—Unfortunately, like other people, our lives are pretty much taken up with other matters.

21470. How do you propose that he should get the information which he cannot get now—I will not say does not?—If they had the information before the Rules were carried into law it would create a discussion, to begin with. Through that discussion he would go minutely into the matter, and it would be on his memory, and he may be in a better position to observe the Rules.

21471. That cannot apply to the Rules existing now?—No.

21472. You do not propose to take any steps to encourage him to carry out these rules?—We always advise him to be very careful and to carry out the rules.

21473. Do you explain to them what the rules are?—Yes, generally their attention is drawn to them when an accident takes place.

21474. I do not see what disadvantage the workmen would be under if the representatives explained to them the effect of these rules, and I do not see why the representatives cannot do that now?—They can as the occasion arises.

21475. With reference to making new rules, how do you propose exactly the proceeding should be? Supposing the owner considers that there is a necessity for a new rule and wishes to propose one under the Act, what has he to do?—Supposing he proposed that, I do not see anything to hinder him also making it public to his men, if it is going to be in the interests of safety. I do not see how the men could object if it is workable.

21476. Do you suggest he should have the sanction of the men before he proposes the rule, or that they should have an opportunity of objecting to it afterwards?—If a dispute arose I should think it might be settled by the Government inspector.

21477. Do you suggest, because we may possibly agree to that, that he should have the men's sanction before he proposes a rule, or that the men should have the right to object before it is established?—I do not see the distinction very clearly.

21478. Supposing you say before an employer proposes a rule that he must have the men's sanction to it?—He might propose the rule.

21479. Would this meet with your views, that the owner should be entitled to propose a rule as he can now, send it up to the Home Office, but before it is established and becomes law that they should advertise this rule inviting any person interested, either workmen or anybody else interested, to make an objection to it, and then that the Home Office should consider the objections, and if they thought that they were such as should require to be considered, that they should then refer the matter to arbitration?—Yes, that would go a long way to meet our views on the matter.

21480. You think if that was done the men would be encouraged to carry out the rules more than they are now?—Yes, I think it would have that effect.

Digitized by Google

21481. With regard to the winding enginemen, do I understand you to say that in cases of dispute where the winding engineman had refused to work that the employer was not to be allowed to get any other winding engineman to get access to his pit?—No, I did not suggest that. I only suggested that he should not be allowed to get anybody except a skilled man.

21482. What is he to do when there is a dispute and his own men refuse him access to his own pit? Is he to give them their terms, or is the place to be drowned out rather than allow some man who has not a certificate to do it?—That is his look out.

21483. Is the place to be drowned out until he settles the terms with the trades organisation?—On the other hand the men would have no object in stopping work—I mean the miner who is not a party to the quarrel.

21484. The coal owners should not allow, according to the Bill brought into Parliament, and should be under serious penalty for allowing anybody to wind up and down the pit who had not got a certificate?—That is so.

21485. If he has a dispute with a limited number of persons who have certificates, is he to have no means of access except by giving them their own terms?—He could easily get out of the difficulty. Part of his staff might be qualified as enginemen and doing other work at the colliery.

21486. You have heard the difficulty about only selecting people they will teach. It is no use having a certificate unless the owner is prevented having access to his pit except by a man who has got a certificate?—That is so.

21487. If there is a limit put on the people allowed to get certificates and those who have certificates will not work, he must have his pit drowned out or agree to their terms?—That is the point as to whether the engine keepers, through the trades organisation, should have a right to put down a limit.

21488. I am looking for safety. This pit might be drowned out and anybody necessarily down below to look after safety and keep it in condition might be injured, and still the owner is not allowed to wind people up and down that pit unless they have a certificate, and if he cannot arrange with a man who has a certificate the whole place must be destroyed?—I think that is an extraordinary view to take of the subject.

21489. I want to put it to you if that is not the fact, and that would be the result?—I do not admit that the engine keepers have a right to restrict the number of men to get certificates.

21490. How would you provide that they shall be made to teach a man? If you can suggest how that can be done I think it would be of great use. You cannct make them teach them?—I think the employers could do it invariably just now. I do not know of any difficulty in that direction which they have ever had. There are none which I have heard of in Scotland.

21491. However, that would be a serious state of things?—Provided the engine keepers had power to limit the number of men to be trained enginemen I think it would be.

21492. Do you know at collieries there are men, who are not trained men, who are capable of winding in an emergency?—Partly capable I should say.

21493. You would prevent the owner employing those men?—Unless they had qualified.

21494. Although he has a class of men whom he can employ in an emergency as you call it, when his own men will not work, you would prevent him employing them for this purpose?—I do not think the men's lives should be handed into their care if they are not practical men.

21495. Now I want to ask you about prosecutions and fining. According to the law of Scotland the Procurator Fiscal decides whether a man is to be prosecuted?—Yes.

21496. The owner cannot prosecute?—No.

21497. The inspector cannot prosecute?—No, unless through the Procurator Fiscal.

21498. I do not think you disagreed as to this, that for trivial offences if a workman agrees to pay a fine rather than go to the trouble of going to the sheriff and give it to some charitable object, that he might do so?—We no not believe in that system.

21499. What would happen where there is a breach of the Act and discipline has been broken?—Would you insist upon a prosecution in every case?—It might reduce the number of breaches of the Act if the man was prosecuted rather than fined.

21500. You think they ought to be prosecuted in every case?—I do.

21501. (*Mr. F. L. Davis.*) On the question of timbering you think if men were specially told off to do the timbering instead of the coal getter that there would be fewer accidents?—I think so.

21502. Mr. Ellis put it to the last witness, do you happen to know this is done in Northumberland and Durham?—I have heard so.

21503. And that the accidents from falls of roof and sides are higher in some cases there than they are where the coal getter does his own timbering in our districts?—That may be on account of the difference in the strata.

21504.—There may be something in that, but at any rate that is the case there. What would you suggest, that there should be a divided responsibility between the man appointed to do the timbering and the coal getter, or that the man appointed should do the whole thing?—The timbering should be done by men specially employed for that work, while at the same time the miner, if he noticed a bad stone in his place, would attend to that; while being generally freed from the work of timbering he would be expected to watch for any special circumstances which might arise, and attend to it.

21505. You must have more than one man in each district to look after the timbering?—A sufficient number, to do it properly.

21506. One man could not be in every place at the same time?—No.

21507. It would mean employing more men?—Yes, it would take a certain number of men in each pit to do the work at present done by the miner.

21508. Do you not think the coal-getter should be the man responsible for the safety of his place, and also that he is the best man to look after it?—As a man with practical knowledge of coal-mining, I should say almost the first aim of the miner is to get as much coal as he can, and that he takes risks. As we say in Scotland, he is afraid to lose his ben, afraid of not keeping his tub filled with his fellow workmen, and because of being pressed to make a wage he neglects timbering.

21509. Take such a man: what would his attitude be to the men appointed to do the timbering for him? If it interfered with his work he would want him to slack off?—I think that could be done without any interference with the miner's work.

21510. Supposing something considerable had to be done in the way of timbering—you say you would leave it to the coal-getter to put up a stone or something of that sort—he would have to wait for this man to come round?—They are generally ready for a rest: a miner is almost at any time, if he can take it.

21511. He does not work eight hours?—He does as a rule.

21512. (*Dr. Haldane.*) He would take a rest at his own expense?—He would probably be ready to take a rest, and be glad to have an excuse to do it.

21513. (*Mr. F. L. Davis.*) If an eight hours bank to bank day were compulsory, he would have less opportunity of taking a rest?—He is glad to have an occasion of that kind as an excuse.

21514. (*Dr. Haldane.*) You are strongly in favour of facilities being provided at the mine for workmen to wash and change their clothing when they reach the surface. Have you seen the arrangements which have been made for this purpose in foreign countries?—I have heard of them, but I have not seen them.

21515. Do you know what they are exactly?—I have a general knowledge of them.

21516. Have you thought out in detail how an arrangement of that sort could best be made, and how the baths or shower baths could be arranged?—No, I have not given it much thought.

21517. You have not seen how they manage it at gasworks. They have arrangements at some gasworks?—No, I have not seen them.

21518. Do you think the men would be distinctly in favour of these arrangements?—They have expressed themselves as being in favour of them.

21519. It has been discussed in your district?—Not very much, I should say, but generally they are in favour of something of the kind being done. It has not been much discussed.

21520. You put it there on the ground partly, at least,

Digitized by Google

Mr. D. Gilmour.

11 June 1907

of health. Is it really on the ground of health that you think these facilities are desirable, or is it on the ground of general comfort and decency?—I think it is more on those grounds than on the ground of health.

21521. You are not aware of any very distinct reason on the ground of health for this?—No, I am not.

21522. Do you think it is undesirable the colliers should go about the streets all black as they do at present?—I think it would be better for everybody concerned if they got back home from their work in something like decency. At present their homes in Scotland are as a rule very much worse than they are in other parts of the country. There are not the same facilities for cleanliness.

21523. Do you know whether their wives complain of that?—They have been brought up to it.

21524. We ought to have some evidence from some of the wives, I think, on this subject. You are also in favour of underground conveniences. Have you seen any mess from this cause in the mines from want of conveniences?—Yes. I have worked as a miner myself, and you cannot go to a place that has a convenience. There is a terrible mess where workmen go to.

21525. Old roads?—Yes. There is absolutely no convenience that I know of in any pit—at least in any pits that I have been in.

21526. In the case of men working at the face, they always use the goaf?—Yes.

21527. That would not cause any nuisance or trouble. There is plenty of coal dust?—I did not understand you. They generally go into an old road that has been used.

21528. At the working face do not they go into the waste? I am not sure what it is called in Scotland—the goaf?—In the workings I have been in there are no open spaces except old roads to go into. The roof is allowed to come in.

21529. Is it stoop and room, or long-wall workings?—Both.

21530. There is no space?—It is what they call the cundy. It would be unbearable there; we could not work, it would be too close to the face.

21531. There is usually plenty of coal dust to cover things up?—That is not done.

21532. That is not done in Scotland?—No.

21533. In consequence of that the same places have to be used again and again?—Yes, that is the rule.

21534. In that case it is bound to get very nasty?—Yes.

21535. Do you think it would be desirable to have conveniences that were regularly emptied at places of that sort?—I certainly think that would be much better.

21536. Are they provided in any Scottish mines that you know of?—None that I know of.

21537. These Poles who come to Scotland have never worked underground before?—The majority have not. We have no definite proof of that. I should take it that it is admitted even by the employers who take them on that the majority have not worked in mines before.

21538. In that case they are not at all likely to be affected?—There is less danger of that.

21539. No Italians come to Scotland?—None that I know of. Certainly there are none in Lanarkshire.

21540. Have you ever heard of Cornishmen coming to Scotland?—Not many.

21541. I want to be clear about the appointment of this suggested new class of inspectors. You propose that they should be appointed by the men. Do you mean that, not that they should be appointed by the Home Office—paid by the Home Office, but appointed by the men?—That point has not been much discussed with us, although I am informed that is the law in France. The workmen select in certain districts the inspector by vote every third year.

21542. Do you think that is a suitable way of finding out who the best men are?—French people tell us it has been very satisfactory, and so far as I know the employers have no objection to raise to that course.

21543. (*Mr. Ratcliffe Ellis.*) In France there is no objection?—Not so far as I know. That is the only place where the system has been tried that I know of.

21544. Still the choice would be very limited by the conditions as to possession of a certificate?—Yes. We do not ask that it should be open to any workman to be appointed, only qualified men who can pass the examination.

21545. That would be rather an anomalous thing to have an appointment made by men in any district and the salary paid by the Government. I do not think there is any precedent for such a mode of appointment, is there?—Except in France; that is the only place.

21546. I mean in England?—No, there is no place that I know of where there is anything of that kind.

21547. (*Mr. Smillie.*) In dealing with the figures of fatal accidents from falls at the face, the question was put to you were you aware that the fatal accidents from falls at the working face in Durham, were higher where the special timbering was done by the men appointed by the employer, than it was in the Midlands. You stated that you had not gone into the matter very much, but the figures prove that the number of accidents is higher at the face in Durham, where the timbering is done by special men, than it is in Nottingham and Derbyshire and other Midland counties where it is done by the workmen. Your answer was that would depend upon the nature of the workings?—Yes.

21548. Would you be surprised to know that in Scotland where it is done by the workmen, the number of accidents is considerably higher than even it is in Durham?—That is bearing out what I say; it may be because of the nature of the strata.

21549. You cannot say that the number of accidents depends upon whether it is done by the workmen or persons specially appointed for the purpose. I find Scotland stands considerably higher even than Durham. 74 fatal accidents took place in 1905 at the face, where 114,000 persons were employed, as against 41 in Durham where 93,000 persons were employed. That would rather argue in favour, if you compare Scotland with Durham, of the timbering being done by special men?—Yes, from the figures.

21550. Dr. Haldane put a question to you in which he is deeply interested, and so am I, about the health of the workmen and providing baths. You said that you advocated those more for the comfort of the workmen than from a health point of view. Is it not the case that a large number of Scottish miners travel a considerable distance by train to and from their work? That is so.

21551. And a very large number of them in Lanarkshire, because of the collieries being shallow, work in very wet workings?—Yes.

21552. Is it the case that some of them before they are 10 minutes at work in the morning are wet through?—Yes, there are cases of that kind.

21553. And very often they have to travel 10 or 15 miles home?—Yes.

21554. Must not that be a very serious thing so far as their health is concerned in bringing rheumatism and asthma?—I should think so. I was dealing with the general question, not with special instances.

21555. That might be taken into consideration in determining whether it would be a good thing to have baths?—Yes.

21556. You know the homes of the Scottish miners very well?—Yes.

21557. Often a miner with his family may be situated in a house with one apartment?—Yes. There are a good many people situated like that.

21558. 14 ft. square, and where the sleeping, cleaning and cooking must take place in the one apartment?—Yes.

21559. And two or three sets of pit clothes are round the fire drying overnight for the next morning?—Yes.

21560. It would be a good thing if they could be removed at the pit bank and dried there, and the men go home clean and tidy?—We condemn that system. We think that class of house should disappear and that people should be provided with better houses. We do not suggest the change on the ground of perpetuating the use of houses of that description, which I understand are in existence in other places.

21561. (*Dr. Haldane.*) Do these exist to any considerable extent?—Yes, there are hundreds.

21562. (*Mr. Smillie.*) Thousands?—I should not put it thousands. The employers in building houses now are putting up a better class of house, but in old colliery villages there are some very poor places.

21563. I suppose that is for want of room. A man would not go to a house like that?—They were satisfied with less accommodation in the past, I suppose. They charge very, very low rents, and if they had a choice of a larger house they would have a larger rental to pay. Even

Digitized by Google

now some men able to afford it take the cheaper houses rather than provide the accommodation they can afford to pay for.

21564. (*Mr. F. L. Davis.*) Is it simply one room by itself, or one room in a house ?—No, it is a house.

(*Mr. Smillie.*) There may be a row of 20 houses, and each of them is a single-apartment house with a door coming into that single apartment, and there are two beds in the house, and the cooking, the cleaning, the births and deaths all take place there, and the pit clothes are dried in that one apartment 14 ft. square. There are hundreds of cases.

21565. (*Mr. Ratcliffe Ellis.*) You do not expect that is going to be perpetuated ?—No, I think that should be wiped out as quickly as possible.

21566. (*Mr. Smillie.*) I think it would be the greatest blessing that could be conferred upon the miners' wives if the men changed their clothes and cleaned themselves at the pit before they came home ?—Yes, undoubtedly it would.

21567. You say you would be satisfied with Mr. Ellis's method of establishing Special Rules ?—Yes, I think that would meet our objections to a very large extent.

21568. Are you not aware that is practically the position at the present time ?

(*Mr. Ratcliffe Ellis.*) No. It is different. First of all there is no opportunity for the men directly to make any objection or be represented. I propose that they should be. Secondly, I propose that there should not be an arbitration, each side appointing one arbitrator and the two an umpire, but failing agreement an arbitrator to be appointed by a Judge of the High Court. My idea is, the men would have an opportunity of objecting to the rule and of being represented at the arbitration.

21569. (*Mr. Smillie.*) There is an opportunity of objection to the rule when it is posted by the Home Office ? —Yes, but it is then in force.

21570. I suppose you think that the workmen are jointly connected with the mines of this country, and to some extent that their lives should give them the same right to propose Special Rules as the employers who have the capital invested ?—Undoubtedly.

21571. If you give the employers that method of establishing Special Rules, would you claim that the workmen might have a right of proposing Special Rules to the Home Office for their safety ?—Certainly; that the workmen should have the same right as the employers to suggest any improvement if necessary.

21572. Mr. Ellis put it that the employers should not be placed in the position, if the engine-winders came out on strike, that their property should be destroyed because they could not start a person without a certificate. Is the employer not in that position now ? If the certificated mine managers came out on strike, they could not carry on their mines with persons who might be qualified but did not hold a certificate. Is not that so ?—That is so.

21573. (*Mr. Ratcliffe Ellis.*) There never has been a case of that sort known. He knew a case of the other sort ?— I did not know a case.

21574. You mentioned where there was a difficulty to fill a gap ?—I thought you said a case where the colliery had been ruined.

(*Mr. Ratcliffe Ellis.*) It might have been.

21575. (*Mr. Smillie.*) If it is possible to ruin a colliery for want of certificated engine-winders, would it not be possible to do so for want of certificated managers ?— Certainly.

21576. You have never heard that urged as a reason why managers should not hold certificates ?—No.

21577. (*Chairman.*) Continuing the question of the winding certificates, a case of emergency might arise; supposing the certificate was necessary and a case of emergency arose when some winding had to be done, somebody would have to do it as best he could. Supposing there was imminent danger of flooding, or the men were required to be taken up from a pit, and the man whose duty it was was ill. In that case the same difficulty would arise. You would have some man to do it whose ordinary work it was not, but the machinery would have to be set going by somebody ?—There should be an exception made in the case of an emergency.

21578. You would not object, supposing there was a provision in the Act of Parliament to say that the winder must have a certificate, but that in any case of emergency anybody who was capable of doing so should attend to the machine ?—No, we should not object to that.

21579. With regard to the firemen, I understand that your idea is that not only are the firemen made to do too much, so that they cannot possibly perform all the duties they nominally are obliged to perform, but you also say that those firemen are appointed not altogether because they are good men to look after the safety of the miners, but also because good men to look after the working of the mine ?—Yes.

21580. The men are employed by managers, partly, no doubt, to look after the safety of the men, but also in the interests of the managers themselves ?—Yes.

21581. Do you think if the firemen were not required to look after the working of the mine, but simply appointed to look after the safety of the workers, the probability would be that the managers would appoint better men ?— Yes, better men.

21582. They have now two things to consider; first of all, whether the fireman is competent to look after the safety of his brother workers; also under the present state of things they have an eye, at least it is conceivable they might, to their own interests in appointing men who would be able to look after the working of the mine from the point of view of the manager's interest ?—The two things are connected. We say that they ought to have a certificate of efficiency to be able to do the work, because if you do not carry that out and you free the firemen from part of the duties they are now performing, it might be open to the manager to employ the cheapest man he could get, an old man, for instance; or a man not having other work to do might be a cheaper man. The protection would be that he should only employ a man who had a certificate of competency.

21583. You consider that in some respects the curtailment of the duties of the firemen might induce managers to appoint a man who was not up to his business ?—That is so, for a lower wage.

21584. As to Clause 8 of the Bill about the second enquiry after the Coroner's Inquest after an accident, your Bill says that six workmen should be empowered to claim another enquiry. It was suggested by Mr. Weir that even one person might be empowered to claim an enquiry. What do you think about that ?—I think, in the first place, if we had it that six workmen had a right, it would go a long way to meet that.

21585. It was also suggested by Mr. Ellis that if six workmen had a right to do so, that a mine manager or any mine official who was found guilty of gross negligence, or even manslaughter, by a Coroner's Jury, should have the same right ?—I think it would be quite reasonable that he should have a right.

21586. You suggest in your Bill, Clause 10, Sub-section 2, "Any person authorised by one or more workmen at the mine at which the explosion or accident has occurred may attend and examine any witness, either in person or by his counsel, solicitor or agent." Do you find any practical difficulty in getting the Court to listen to anything that may be said on behalf of the workmen ?—In fatal accident enquiries ?

21587. Yes.—Not in Scotland. We get every facility in Scotland.

21588. As far as you are concerned in Scotland you have not much to say about this ?—There is no complaint at all about that.

(*Chairman.*) I do not know how far that alters the law.

21589. (*Mr. Ratcliffe Ellis.*) The last Fatal Accidents Act gave them that right ?—We had the right. It was questioned sometimes by Sheriffs, but it was ultimately admitted.

(*Chairman.*) This does away with any doubts.

(*Mr. Smillie.*) It gives the power to England and Wales that we have now in Scotland under the Fatal Accidents Enquiry Act.

(*Chairman.*) That is the effect of Clause 10, Sub-section 2, to give to England the same power the workmen have in Scotland.

(*Mr. Ratcliffe Ellis.*) There are no inquests in Scotland.

21590. (*Chairman.*) Their place is taken by the Fatal Accidents Act. With regard to the appointment of Government Inspectors, at present, it is in the option

Mr. D. Gilmour.
11 June 1907

of the Home Office, whether a man passes any examination or not; he need have no experience, and pass no examinations. As a matter of fact the examinations are stiff, and the experience required considerable, but any Home Secretary might alter his mind and say, "I want to appoint so-and-so and do away with the qualifications." The qualifications are not statutory. Do you suggest any statutory qualifications? — At present we have no ground of complaint. The Home Office has evidently carried it through in the spirit in which we believe it should be carried through.

21591. You are satisfied with the appointments that have been made, and you hope and trust that the future appointments will be as good?—We have no objection in Scotland, as far as I know.

21592. Still, you want more appointments?—Yes, more appointments.

THIRTY-THIRD DAY.

Wednesday, 12th June, 1907.

At Edinburgh.

PRESENT:

Lord MONKSWELL (*Chairman*).

F. L. DAVIS, Esq.
ENOCH EDWARDS, Esq., M.P.
THOMAS RATCLIFFE ELLIS, Esq.
JOHN SCOTT HALDANE, Esq., F.R.S.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. PETER MUIR, called and examined.

Mr. Peter Muir.
12 June 1907

21593. (*Mr. Smillie.*) Are you the Secretary and one of the Agents of the Ayrshire Miners' Union?—Yes.

21594. Is the Ayrshire Miners' Union connected with the Scottish Miners' Federation?—Yes.

21595. Had you had considerable experience as an underground worker previous to taking your present post?—Yes.

21596. Has your attention been called to a statement made by Mr. Ronaldson, a Mines Inspector, on the question of discipline in the Scottish mines?—My attention has been drawn to it.

21597. Are you aware that he stated in evidence before this Commission that the Miners' Association sometimes defended their members who were charged with a breach of the Mines Act?—I am aware that that statement has been made.

21598. And that in making that statement he particularly referred to Ayrshire?—I so understand.

21599. Is it the general rule that your Association defends men who are charged with a breach of the Mines Act?—The rule that we have hitherto followed is that when a party is charged with a breach of the Mines Act, and asseverates that he is innocent, we only give him legal advice to prove whether he is innocent or guilty, and beyond that we do not go.

21600. I suppose we may take it that the Union would not defend a member if they thought he was guilty of a breach of the Mines Act?—We have never done so.

21601. But you have given legal advice to members charged with breaches of the Mines Act who you believed were innocent?—Yes.

21602. Do you think that the giving of legal advice to your members who are charged with a breach of the Mines Act has led to a want of discipline amongst the underground workers, and that it has encouraged men to be guilty of a breach of the Mines Act?—There is no influence of that kind that I am aware of. We have always set our faces against any infringement of the Mines Act, and, as I have said, it is only those cases where the men have very strongly asseverated their innocence, and even in some cases brought witnesses to substantiate their position, that we have given them legal aid to try and prove their innocence.

21603. Do you encourage your members, so far as you possibly can, at your meetings and otherwise, to observe the Coal Mines Regulation Acts and the Special Rules?—In every case we encourage them to observe the law in the way of promoting the safety of the miners.

21604. Do you know whether or not there is any really serious want of discipline in your mines in Ayrshire?—I am not aware that it is any worse than any other county in Great Britain. I have never heard that—in fact, some of our folks complain that we are over-disciplined in some cases.

21605. Some of the miners?—Yes.

21606. They complain that the discipline is too strict?—Yes, in some cases.

21607. You do not encourage them to be guilty of breaches of discipline?—Certainly not.

21608. Is there any system of fines imposed by any of the managers in your county for breaches of the Special Rules, or of the Mines Acts, instead of taking the men before the Law Courts?—There are present to my mind just now two firms who have tried the fining system, and I understand it is enforced where the men submit to it, but, of course, in some cases they have had to give way.

21609. Do you yourself think a system of fines would lead to discipline, more so than prosecutions before the Court?—I understand you mean by fining that the firms themselves fine.

21610. That the management fine the workmen. Do you think that would tend to improve discipline? Would it be more of a warning to the men if you took them before the Court than having a system of fining?—I do think it would be. I think prosecution by the local authorities is more effective.

21611. Therefore you do not favour a system of fining?—No.

21612. You say in a letter which you have sent to the Secretary that you are in favour of more extensive Government inspection of the mines?—Yes.

21613. Do you think that the present system of inspection is effective?—When you read the latest report of our inspector in the West of Scotland, where he himself states that they have been able to inspect each mine once for the year 1906—I do not think it goes beyond that—I think it will be easily understood that is not a very effective inspection. I take it that a good number of those inspections would be the outcome of accidents taking place in the particular mines.

21614. So far as your opinion goes, do you know whether or not there are thorough inspections of the mines in Ayrshire undertaken by the Mines Inspector—and what I mean by thorough inspection is all the places being visited by the inspector?—My only experience in that respect is

Digitized by Google

this: that I have heard statements made very frequently that the working places are not inspected—there is just, I might say, a general inspection of perhaps the main roads, and so on.

21615. That, you think, is not sufficiently frequent?—Quite so. I have had such statements made to me frequently. It is hardly yet a fortnight old since one old miner with 40 years' experience told me he had not seen a mines inspector in his working place three times in the whole of his experience.

21616. You are dealing now with inspection by the Government Inspector, and not, of course, by the workmen's inspectors?—Yes.

21617. Have you any number of additional inspectors in your mind that you would like to see appointed?—The question has been very frequently discussed amongst our people in Ayrshire, and the desire is expressed that there should be additional inspectors, but we have hitherto not been able to put it in force.

21618. Have you in your mind any particular number of additional Government inspectors that you would like to see appointed in order to make the inspection effective?—We have a feeling—a conviction really—that there should be additional inspectors, so that the changing nature of the mines might be more frequently brought within their purview, because it is not possible for the existing number to do it effectively.

21619. Do the District inspectors, and the two assistant inspectors, for the West of Scotland, reside in Glasgow?—I think there is one at Rutherglen.

21620. Is that just outside Glasgow?—Yes.

21621. What distance is the residence of the inspectors in Glasgow from the extreme end of your county?—Roughly, about 55 miles.

21622. That would be about two hours or two and half hours' journey by ordinary train?—About that.

21623. (*Mr. Ratcliffe Ellis.*) Is that the extreme distance to the collieries?—Where the collieries are situate.

21624. (*Mr. Smillie.*) That is what you mean, where the colliery is situate?—Yes. I think the South of Ayrshire collieries would be the furthest away, and it would be about 55 miles from where Mr. Ronaldson and his assistants live. It would be five or six miles further into the Dumfriesshire collieries.

21625. It is over 60 miles really to the extreme point of Mr. Ronaldson's district from Glasgow in that direction?—Yes.

21626. And his district may extend in the other direction north of Glasgow?—Yes.

21627. So that a considerable part of the Inspector's time would be taken up in travelling if there are many inspections made in those collieries?—A very large proportion of the time would be taken up in travelling. When you go past the principal towns the trains are very infrequent, and a lot of time is wasted in getting to and from the collieries.

21628. Do you favour the idea of assistant inspectors being appointed who would reside in the mining districts more closely in touch with the collieries?—I think, besides more frequent inspections, the fact that they did reside nearer would conduce to better inspections.

21629. Have you in your mind any number of workmen for whom you would like to see an inspector appointed—I mean would you say 10,000 or 5,000 men, or what number do you think an inspector could effectively inspect a mine for?—10,000 has been frequently spoken about, but in respect of the pits I have most experience of 10,000 would be a big number, for this reason, that the pits, in my experience, are small pits in Ayrshire generally, and that, of course, means that there is more labour entailed in inspecting what would cover 10,000 men.

21630. You mean by small pits that they vary from the employment of about 30 to 200 people, perhaps?—Yes, about 100 is a common thing with us.

21631. So that 10,000 would practically mean the whole of Ayrshire?—Yes.

21632. Which would be a very large district for an inspector to inspect?—Over 100 pits.

21633. I believe you are not satisfied with the present arrangements as to the appointments for inspection by the workmen, and you say you want an alteration in Rule 38 of the Mines Act. Are you satisfied with that rule as it stands at present, viz., that they have power to appoint two working miners to inspect the colliery?—We can hardly say we are satisfied, for the simple reason that only on two or three occasions has it ever been put in force in Ayrshire. The reason, plainly speaking, is that the men employed in the colliery are afraid to do the inspection and take the responsibility involved in giving a report because of what they fear might happen.

21634. Is it a fear merely, or, so far as you know, is there any ground for the fear? Have there been any cases of victimisation or illtreatment, so far as you know?—Well, one old miner reported to me less than three months ago that he had done it once—it is a very old story—and because of the treatment meted out to him at that time it was never attempted again in the Ayrshire district.

21635. That would be years ago?—Yes, years ago.

21636. You have no such experience of recent years?—No, we have never tried it, for the reason I indicate, of the feeling amongst the miners that it would not be safe for them to do it.

21637. So far as the right is concerned, you would be satisfied if the workmen had the right to appoint working miners or those who had been practical working miners?—Yes.

21638. You would be quite satisfied if the words were "or had been a practical working miner"?—Yes.

21639. Have you any idea of the extent of the firemen's district in Ayrshire?—I could not say beyond this, that they are generally bound to keep within the statutory limits, that is, to do the rounds within the two hours prescribed by statute.

21640. Do you think that they are able, as a matter of fact, to make the statutory examination necessary by law to its fullest extent in two hours?—Complaints have frequently reached us that men were given districts that they could not cover. In fact, it is within a month I have complained to Mr. Ronaldson as to one district, because by visiting the colliery and looking at the plans they acquainted me of their opinion that he was able to do it, but the firemen who were formerly in the position still assert that it is impossible.

21641. You have had a complaint as to the extent of a district and have reported that to the Mines Inspector?—Yes, about a month ago.

21642. Has he made enquiries?—I had a reply from him saying his assistant had been down at the colliery, and he found it could be done within the prescribed time. I have been there since, and the men still assert it cannot; and the inspector was not down the pit.

21643. You have been at the colliery since, and the workmen assert the work cannot be done?—That is so.

21644. But the Mines Inspector, without going down the pit, has found it can be done?—That is so.

21645. It is complained generally that the districts are too large?—We have complaints arising occasionally, but I would not like to say they are general. Now and then perhaps a complaint comes in at an interval of six months.

21646. What are the duties of a fireman at the collieries in Ayrshire? Is the duty confined to looking after the ventilation and the safety of the mine at the face, or are there other duties they have to perform?—I understand at some of the smaller collieries, where their statutory duties are not very exacting, they are set to perform other classes of work.

21647. What kind of work?—I think it is what is called repairing work.

21648. Do you know of any cases in which they are responsible for looking after the pony-drivers and getting the hutches out?—I could not specify any case of that kind

21649. I suppose you consider that the position of a fireman is a very important position?—Yes.

21650. You have not very much explosive gas in Ayrshire?—No, we are pretty free from that.

21651. It is a non-fiery district?—Yes. At a few collieries they do use safety lamps.

21652. Is it the case that there is a very considerable amount of what is known as black damp in some of the Ayrshire collieries?—Yes, more or less.

21653. I suppose you consider that that requires to be guarded against as much as explosive gas?—Quite as much.

21654. Do you consider that it would be an additional qualification to a fireman if he held a certificate of competency after examination?—We have very pronounced

Digitized by Google

Mr. Peter Muir.

12 June 1907

opinions upon that, in our part of the country. The fireman, it is very often understood, is appointed not because of his experience or his qualifications, but largely for cheapness; and we think that some kind of examination should be undergone by men undertaking such a responsible position.

21655. (*Chairman.*) You mean they are paid too little to obtain the services of the best men? Is that what you mean by "cheapness"?—Yes. I maintain that cheapness is an element in getting them appointed to these positions.

21656. You think if a man were compelled to have a certificate before he could be made a fireman, he would not work for such small wages as he could be got to work for now?—That is so.

21657. (*Mr. Smillie.*) Can you give us any idea roughly of the wages paid to men in this position?—At the present moment firemen in Ayrshire will be receiving a wage ranging from about 5s. 4d. per day up to what we recognise as our wage just now, 6s. 6d.

21658. (*Mr. Enoch Edwards.*) Is that the nett wage?—That is the nett wage.

21659. (*Mr. Smillie.*) On the question of the drafting of Special Rules, I notice that you say that the workmen's representatives should be consulted by the Home Office in the framing of Special Rules. Have the workmen in Ayrshire, or Scotland generally, been consulted previously in the framing of any special rules, do you know?—Never that I am aware of.

21661. Do you consider that the rules would be more likely to be observed if the workmen had a voice in the framing of them?—Yes.

21661A. Do you think that any assistance gained from the experience could be given by the workmen in the framing of rules for their own safety?—I am satisfied that anything embodying the desires of the workmen would contribute to greater safety and be more respected, because they would have had a say in it. Meantime they grumble very loudly that these rules are framed and established, and that no one representing them has ever had to do with the framing of them.

21662. The present system of timbering in Ayrshire is that the workmen look after their safety in the working face?—That is so.

21663. Have you any opinion on that matter, as to whether that system should be altered?—I have never given very much attention to that point; but there is no doubt it would induce to greater safety if some arrangements could be made whereby special men should be set apart to do it or to see to it.

21664. Either to do the timbering or to supervise the timbering being done?—Yes.

21665. I notice you say that the man appointed to the position of fireman should have experience in timbering and other matters. Do you think the fireman should be the person specially appointed for either doing the timbering or supervising its being done?—What was in my mind when I wrote that was that under the existing law the fireman should, but I am not sure that the duties would not be too onerous for the fireman if he also had to supervise the timbering.

21666. Unless the districts were made considerably smaller?—Yes.

21667. It might be possible to make the districts smaller so as to enable him to thoroughly supervise the timbering of the working places?—Yes.

21668. (*Chairman*). And if the places were sufficiently small you think it would be advantageous that the fireman should combine both duties?—That is so.

21669. (*Mr. Smillie.*) His experience places him in a position to know where danger exists from falls?—That is so.

21670. And consequently he would be the best person to know what was needed?—Yes.

21671. Have you any very large number of foreign workmen working in the mines in Ayrshire?—I can only give a general estimate, they are such a fluctuating quantity with us. I think the number of underground foreign workmen in Ayrshire at the present moment, and for some time past, would not exceed more than 200 to 300.

21672. (*Chairman.*) Out of how many workers altogether, do you say?—Out of about 10,600.

21673. (*Dr. Haldane.*) Are those nearly all Poles?—Nearly all Poles with an odd exception—there are two or three Germans, but an inappreciable number.

21674. (*Mr. Smillie.*) I suppose you have no fault to find with the German workmen?—None whatever.

21675. They are practical miners before they come to your mines?—Quite so.

21676. And you have no fault to find with foreigners if they are skilled and experienced workmen, and understand the language?—No.

21677. Do you think that workmen who do not understand the language constitute a serious danger to themselves and to other workmen?—It is not very pronounced with us, but it is usually understood that if they were put into a fiery mine the danger would be pronounced.

21678. It would be increased?—Increased very much.

21679. (*Chairman.*) You say you are quite satisfied with the Germans who work in the mines. Do the Germans workers understand English?—Very imperfectly. We have only a few, but the few I have come across can converse with you, although it is somewhat difficult for them.

21680. Do they know enough English to make it safe for them to work in the mines? Do they understand the rules and regulations?—It seems so. They have always been able to follow their instructions fairly well.

21681. (*Mr. Smillie.*) The Germans to whom you refer have been a considerable time in this country?—That is so.

21682. And you have heard no fault found with them as not being able to understand the rules?—No, there is never any complaint.

21683. They are efficient miners, of course?—Yes.

21684. You know there is a strong feeling among the Scotch miners generally on the question of the employment of foreign workmen who do not understand the language?—That is so.

21685. Have you any extensive system of mechanical haulage in the pits in Ayrshire?—Yes; it extends pretty generally through the newer collieries especially.

21686. You are aware that there are a considerable number of accidents arising from mechanical haulage?—Yes.

21687. Would you be in favour of enforcing the system of a continuous chain, or rope attachment, over a train of hutches or trams which were in process of being conveyed to the pit bottom?—In view of the frequency of these accidents, and the simplicity of the arrangement, we think it should be made compulsory that some arrangement of the kind you indicate should be put in force to guard against a breakaway.

21688. Have you anything of that kind at the present time?—I could not specify any particular case. I do not know of any.

21689. (*Mr. Ratcliffe Ellis.*) How long is it since you worked in the mine?—It would be nearly 30 years ago.

21690. And since that time you have been a miner's agent, I suppose?—Most of the time.

21691. Are you frequently down the pits now?—Occasionally, just now and then.

21692. Why do you go down now?—If there is a dispute between a section of the men and the employers indicate their wish, perhaps, for us to go down and have a look, in those cases we go.

21693. That is not for safety?—No.

21694. What is the object of that visit?—It is generally proposed to decide as to whether the men are being fairly treated in their payments.

21695. Now supposing the management decline to allow you to go down, how would the dispute then proceed?—If the management object we accept unreservedly the statements coming from the men's side.

21696. With reference to defending a man, you do not see any harm in the Union defending a man for an offence of which you think he is not guilty?—We wish, in taking up this attitude, to give the man, who asseverates his innocence, the benefit of the doubt until he is proved innocent or guilty.

21697. And there can be no harm in assisting him to prove his innocence?—No.

21698. Do you pay the fine if the Court finds him guilty?—We have never paid a fine.

Digitized by Google

21699. Have you a rule which says you shall not pay the fine?—We have no rule; but we have been appealed to frequently and we have consistently refused to pay fines where parties have been found guilty.

21700. Even where it is a case in which you thought you should assist in defending?—Yes.

21701. In those cases, if the Court finds he is guilty, you do not pay the fine?—We do not pay the fine.

21702. You say that you generally encourage your members to observe the regulations—Certainly.

21703. How do you do that?—When we are holding meetings and points of this kind arise.

21704. Points of which kind?—Regarding cases where men have got involved. We take the opportunity usually of telling them that for their own sakes they should observe the law.

21705. Are any of those speeches reported anywhere?—Not very frequently.

21706. Do you happen to have the report of a speech in which you have encouraged them, for instance, to obey the law?—I could not give you the report of any speech.

21707. You make a great many speeches, I have no doubt, that are reported from time to time?—We are pretty frequently at that.

21708. You have never had a speech reported in which you have encouraged them to obey the discipline of the pit?—We have never taken the opportunity, even if it was reported, to preserve it for any specific purpose. Such speeches may have been reported, but I think it is very well known amongst the management that we take up the attitude of encouraging an observance of the law and everything pertaining to the safety of the mine.

21709. The mines inspectors for Scotland suggest that the discipline is not satisfactory because, in some cases, the men are defiant altogether, and have not been brought up to obedience, and it is very difficult to maintain discipline. Is that so?—As I have said, I have never heard any complaints on a matter of that kind.

21710. From whom would you be likely to hear complaints? Not from the men?—The complaint comes usually the other way that they are too much tied down.

21711. Do you agree with the inspectors' view that there is a great absence of discipline amongst the men, that they are not amenable to discipline, and will not obey orders?—I would not like to say that that obtains to any large extent.

21712. Would you like to say it does not?—I believe in individual cases there are foolish people who will kick against instructions making for their safety; but I do not think that obtains to any great extent.

21713. Not to any sufficient extent to affect the general safety?—That is so.

21714-5. With reference to fines and prosecutions, there are many breaches of discipline that are not in themselves of a very serious character, I suppose?—That is so.

21716. Do you advise in those cases, where it is not a very serious breach, but it is a breach, there should be a prosecution?—I know that the expenses of a prosecution and the trouble are always considerable. We quite recognise that.

21717. To both sides?—Yes.

21718. Would you advise that there should be in all these cases a prosecution?—I could not advise it.

21719. Would you advise that it should be passed over altogether?—I think there is always another way of getting at it. The management usually has sufficient authority to put that right.

21720. How—discharging the men?—Not exactly discharging, but the issue of cautions and letting them know that consequences will ensue.

21721. How often should they be repeated, do you think?—That is a matter of discretion.

21722. What is your objection to a fine agreed to by the men for trivial cases? If the management and the men agree that a small fine should be paid, why do you object to it?—Because I do not think it is so effective as a prosecution. I was looking at it in a general way.

21723. And the management should decide whether they should prosecute or whether they should pass it over—that they should do either one or the other?—Yes.

21724. You think that is conducive to discipline?—I should think it was.

21725. With reference to the inspection by Government inspectors: you do not suppose these Government inspectors are to manage the collieries?—Not for one moment.

21726. Is their duty, in your view, to be more than seeing that the collieries are being properly managed by the responsible management?—I think that is exactly the duty.

21727. Do you think that an examination every six months of each colliery by the inspector would be sufficient?—That is a matter of opinion, but I think it should not be less.

21728. How frequently do you think there should be an inspection of each colliery by a Government inspector?—I find that at the present time it does not come much more frequently than once in 12 months; and, speaking generally, I think that is a great deal too seldom.

21729. I wanted to get your opinion as to how frequent you think it ought to be?—I think it would not be asking too much to have a mine examined once every three or four months, in view of the constant changing nature of the conditions.

21730. Do you think that is necessary in every case in every mine, or are there some mines which you think might be less frequently inspected?—That would depend largely on the conditions attaching to the mine.

21731. What conditions?—The changes in some mines are more thorough and they need to be attended to.

21732. Tell us the changes you have in your mind which would necessitate a more frequent inspection?—Well, the main roads may be altered.

21733. In what way altered?—By going in different directions.

21734. Extended merely?—In the case of extension there is not the same necessity for a renewed inspection.

21735. What kind of alteration in the main road do you think necessitates more frequent inspection?—Looking for the material in different directions.

21736. What material?—Coal or ironstone.

21737. As to the road itself, what conditions are in your mind which make you think they would necessitate a more frequent inspection?—Where the conditions of the mine have, as I have said, radically changed in the meantime.

21738.—If the conditions of the mine have not radically changed in the meantime the inspections would not need to be so frequent?—They would not.

21739. What do you mean by a radical change? What would contribute to it?—A lot of things might contribute to the change.

21740. What things?—As I have said, the whole character of the pit might change in the meantime.

21741. Have you ever known a case in which within six months the whole character of the mine changed?—I have known it taking place, in these small pits especially, very frequently.

21742. That the whole character of the mine changed, or is it you mean the whole character of the seam of coal changes?—No, but in the looking for the seam and the getting it.

21743. Take a case where they have the seam and they are working it. I want your view, in connection with this radical change, which you say you think would necessitate a more frequent inspection?—Well, that is the only explanation I can give.

21744. You think that the inspection should be more frequent because of the danger of radical changes in the mine occurring between one inspection and another?—Yes.

21745. (*Chairman.*) Do you suggest it would be necessary to have a government inspection every three or four months in most of the pits with which you are acquainted?—Generally speaking.

21746. In most of the pits you think it would be desirable?—Yes.

21747. (*Mr. Ratcliffe Ellis.*) In most of the pits with which you are acquainted?—Yes.

21748. Is there a radical change which takes place within a period of three or four months?—I might say generally that does obtain.

21749. There is a radical change in the whole character of the pits?—In the older pits, I should say.

Mr. Peter Muir.

12 June 1907

21750. Take the newer pits. Do you think the inspection should be as frequent as every three or four months in the newer pits?—I do not think there is the same pressing necessity.

21751. Where the conditions of the pit are pretty much the same then the inspection is not required to be frequent?—That is so.

21752. Had this old miner you spoke of, who said he had never seen an inspector in his working place more than three or four times in 30 years, been working at different places during that time?—I understood he was working generally in the same locality. He did not specify them.

21753. Different pits in the same locality?—Yes, different pits in the same locality.

21754. And working in different working places?—Yes, that is possible.

21755. So that a mines inspector might go into the place where he had been working a fortnight before, but not in the place where he was then working?—That is possible.

21756. And the mines inspector might have been in that place where he was then working a fortnight before?—It is possible that might happen.

21757. Have you any reason in your mind why you should fix 10,000 men as the number that should be subject to one inspector?—The reason why I fix that number is that I have looked at our own locality and its needs.

21758. In your locality you have 10,000 or thereabouts, and you do not think the number of inspectors sufficient for that?—That is so.

21759. How many inspectors are there?—There are three for the West of Scotland; but that takes in, I think, half of Lanarkshire roughly.

21760. What is the number of men in that district?—Between 40,000 and 50,000.

21761. I think we were informed 46,000; and there are three inspectors for 46,000 underground workers?—Yes.

21762. You think there should be one at least for every district?—Yes.

21763. And that is the way in which you come to fix 10,000?—I stated also that our district was peculiar in having so many small pits, which increases the labour.

21764. You think in your district there should be at least one inspector for 10,000, on account of the peculiarity of the district?—Yes.

21765. That is how you get at the 10,000?—That is so.

21766. Now with reference to Rule 38. The Act provides that practical working miners may themselves have an opportunity of making an inspection?—Yes.

21767. Can you suggest better persons to do it than the men themselves in the mine, putting aside fear of consequences?—The men in the mine are thoroughly capable of doing it.

21768. And are they not the best men to do it if these reprisals were not feared?—I believe that to be so.

21769. You mentioned one case in respect of which you heard of an old man who suffered from making an unfavourable report?—That is so.

21770. How long ago was that?—It must have been between 20 and 30 years ago.

21771. That is the only case you have where it is suggested that a bad report was made and he had to suffer for it?—That is so.

21772. Did you ever hear of another case?—I should explain that we have never tried to avail ourselves of that for a long number of years in Ayrshire because of the known fear on the part of the men who do it.

21773. 30 years ago there was no Miners' Federation in Ayrshire?—No.

21774. There was no organisation whatever?—That is so.

21775. But you choose to think that because 30 years ago one case happened where a man was punished—and we will assume he was punished—for making a bad report, that the same state of things would continue now?—We have no reason to think otherwise.

21776. And that fear has been upon you ever since?—That is so.

21777. Do you suggest that this inspection under Rule 38 should be made by anyone appointed by the miners' organisation?—I think so, if they have proved experience.

21778. Who is to decide that question?—I do not think the miners themselves, if they wanted an inspection, would appoint a man who had not experience.

21779. They might be mistaken. You propose that they should be left untrammelled as to the person who is sent there?—Yes.

21780. In the present Act it says a mining engineer is not to be sent?—Yes.

21781. Why is that? Do you propose that that should be altered also?—I expect that that prohibition is there because he is thought to be an interested party.

21782. Would not a miners' representative be an interested party also?—Certainly, in the same sense.

21783. Do you think it would be reasonable that that power of inspection should be extended to anyone to be appointed by the miners' organisation unless he was controlled in the same way as the Government Inspector is as to the use he should make of the information he might get when he made the inspection?—I expect, although he made a report, the employer would still have a way of getting that report reviewed.

21784. I am thinking of other things. You went down the pit occasionally in order to settle disputes which had arisen. Now supposing you had been refused, then you would be entitled to go if you were appointed to make an inspection under the pretence of safety?—Yes.

21785. Do you think there should be any limit put upon the use a man should make of this power to go down these pits?—Personally, I should agree that his power should be limited to the object laid down.

21786. That he should be put under certain restrictions as to the use he might make of it, and the way in which the power should be exercised?—That is so.

21787. Have you any notion as to what that restriction or limitation should be?—I have never given any thought to the question of limitation.

21788. You agree there should be a limitation, or it might be mischievous?—That is so.

21789. I think I understood you to say, or in effect this was your view that generally the firemen do their duty satisfactorily if their districts are not too large?—Yes, generally speaking.

21790. In exceptional cases that is not so, the districts are too large, and the men are not competent?—Yes.

21791. What proportion do these exceptional cases bear to the whole, do you think? How many objections have you had during the last 12 months?—We have never gone into it closely as to the extent to which it prevails, but, judging from the frequency of the complaints, I should be inclined to think that at least 25 per cent. of the men should not be in positions of the kind.

21792. Does that apply to particular collieries? Are there certain collieries to which there is no objection?—I would not like to specify any particular colliery.

21793. Are there collieries where the system is you give a man a limited area and you appoint competent men? Are there collieries to which you have no objection on either ground?—Yes.

21794-5. Your objection is confined to certain collieries?—Yes.

21796. Are the collieries, as regards which you have complaint to make, 25 per cent. of the whole?—I am giving a rough idea from the frequency of the complaints.

21797. I understood you to say it was only occasionally that these complaints were made?—Yes, it is from the frequency of the complaints coming in—occasionally, put it in that way.

21798. I do not understand that? Do these complaints come in frequently or occasionally?—Put it occasionally.

21799. Are they in reference to the same pits?—It is distributed pretty generally.

21800. You have mentioned one case in which you complained to the inspector that the district was too large. Is that the only complaint you ever made?—No.

21801. How often have you complained to the inspector?—Charging my memory, I believe I have complained within the last two or three years, perhaps, three or four times.

Digitized by Google

21802. They are the only occasions you have had to complain ?—That is so.

21803. The inspector on the last occasion inquired into it ?—Yes.

21804. He came to the conclusion that the district was not too large, rightly or wrongly ?—Yes.

21805. What was the result of the previous complaint that you made ?—As a rule the inspector finds out that the firemen can do the thing in the time prescribed. There was one case which occurs to me just now where, I think, there had to be a little curtailment to enable them to do it.

21806. Except in one case the inspector has inquired into it and come to the conclusion that the districts are not too large ?—Yes.

21807. In that one complaint, in the case where he thought it was too large, what happened then ?—It was put right.

21808. You think that the fireman should have a certificate of competency. What is the examination to be ? Ought he to have a second-class certificate, or ought there to be some special examination ?—I think that a special examination should be set for a man undertaking special duties.

21809. Why should not a second-class certificate be sufficient? Why should there be a special examination ?—I think that would be quite satisfactory.

21810. Not a special examination ?—There is one little difficulty with me in the second-class certificate. I hardly think that the practical experience is commensurate with duties of that kind.

21811. He must have five years' practical experience in a mine ?—I am speaking from what I know of some who hold these ; in the mine they have very little practical experience of coal getting or working at the face.

21812. They do not want experience in coal getting for inspecting ?—They are none the worse for it.

21813. They are hardly any the better for it ?—Yes, they would be better for it.

21814. Do you think for the position of fireman that a man ought to be better qualified than for the position of under-manager ?—He ought to be equal.

21815. The second-class you would give him would give him that ?—Yes ; I would not have any serious objection.

21816. The wages range from 5s. 4d. to 6s. 6d. a day ?—Yes.

21817. What do you suggest it ought to be ?—It is rather a delicate matter for me to suggest the wage, but, I think, in a responsible position that they should at least have the wage that is recognised as being paid to the working miner at the face who, while work may be hard, has less responsibility.

21818. A working man at the face has the chance of only working two or three days a week and the fireman works every day ?—Yes.

21819. At the week's end, although there is a less wage for the fireman, he may have more wages in his pocket ?—But he has given the service for it.

21820. Do you think that the fireman should have the same daily wage as the collier when the fireman is working every day and the collier taking the risk of only working two or three days a week ?—I do not think it right that a man should accept serious responsibilities unless he is fairly well paid.

21821. You do not think 6s. 6d. a day is enough. Do you know if there is any difficulty in getting this class of man at 6s. 6d. a day ?—There seems to be no difficulty in getting them.

21822. Where you have no complaint to make of the competency of a man in a colliery is that the wage there ?—Where the recognised wages are paid we hardly ever have a complaint.

21823. What is the recognised wage ?—6s. 6d.

21824. Where 6s. 6d. is paid you never have any complaints ?—I cannot remember any just now.

21825. You look upon 6s. 6d. as more like the wage than 5s. 4d. ?—It seems to command a better class of man.

21826. As to the Special Rules : do you think that the miners' representatives should be consulted ?—I think so.

21827. In what way ? Have you any scheme in your mind as to how that could be carried out ?—I have no scheme in my mind, but I think that where a change is desirable that those who represent the men should be consulted before the thing is established.

21828. I agree, but the question is the time exactly when they should be consulted. At the present time the owner is bound under the Act of Parliament when he establishes a colliery to propose Special Rules ?—Yes.

21829. He is entitled at any time after the establishment of these rules to propose amendments to those rules ?—Yes.

21830. Do you suggest that he should not be entitled to propose an amendment without the men's consent ?—I think that he should be consulted and that the men should be consulted, and then that it should be left in the hands of the Home Secretary and his advisers.

21831. Would this suit you : supposing the owner is left at liberty to propose a new rule to the Home Office and before establishing the rule and making it binding on anybody the Home Office should advertise this rule as proposed by the owner, and then the men or any person interested should have an opportunity of objecting to it, and their objections considered, and if they cannot be met that the matter should be referred to arbitration ?—I believe that would meet the case to a large extent.

21832. To what extent would it not meet the case ?—It seems to me to be fairly reasonable.

21833. You do not want anything that is not fairly reasonable ?—No.

21834. Now with regard to timbering ; do the men do the timbering themselves ?—Yes.

21835. I dare say they think they can do it better than anybody else. Is that so ?—I expect they know their needs quite well.

21836. Is not the collier himself the best man to do the timbering : he is constantly in the place and on the watch, and he sees when timbering is wanted and puts it up. Is he not the best man to do it ?—There are other elements to be considered.

21837. I am not forgetting those, but from the point of view of safety is he not the best man to do it ?—I admit that.

21838. It takes some of the time he would use in getting coal to put this timber up ?—Yes.

21839. Do you want him to have all his time to get coal and somebody else to put the timber up ?—If it could be reasonably arranged, I think, it would work better for safety.

21840. You have already told me that you think the collier is the best man to do it, and could do it most consistently with safety ?—Yes, but the other man, if appointed, is supposed to have a knowledge equal to the miner who is working.

21841. Do you think there are many people who have the same knowledge of timbering as an old miner accustomed to do it all his life ?—It is not an old miner in every case.

21842. Take the generality of miners, a man who has had two years at the face is pretty well up to this. Supposing there is a man appointed to do the timbering he would have to be appointed for a number of places ?—That is so.

21843. Supposing a collier finds some timbering wants putting up, is he to stop his work and wait till this man comes to put the timber up ?—We quite recognise that there would be a little difficulty in that respect, but whether it would be greater than the danger that accrues from the present condition of things is the point.

21844. Why does danger accrue now if the best man to put up the timber is the collier ?—That brings me to the point I wish to get at : no matter how you impress on miners the need for safety, they are paid for piecework just now, and the anxiety to get the wage sometimes overcomes the feeling that they should stay from getting coal and prop their places and make them more secure.

21845. Do you suggest if that obligation which the coal worker is now paid for is transferred to the management, that there should be a reduction in his wages ?—In the coal-getter's wage ?

21846. Yes ?—That would be a matter of arrangement. What is present to my mind is, if it could be adopted, a day wage for the coal-getter.

21847. That is altering the whole system of payment. Do you suggest if the collier is to be relieved of this duty because he wants more time to get coal, that he would be content in return for the greater safety to part with a proportion of his wages towards paying the man to do the work he at present does ?—I am not prepared to answer that.

21848. That wants a good deal of consideration ?—Yes.

Digitized by Google

Mr. Peter Muir.

12 June 1907

21849. The whole subject wants a good deal of consideration ?—Yes.

21850. Now with regard to foreign labour: your objection, I understand, is that a man cannct understand what is said to him if he cannot speak Scotch, or whatever they talk in these mines ?—That is really the main objection.

21851. I suppose that some Poles can speak English ?—A few.

21852. Can they speak as much English as the Germans you mentioned ?—I have come across individuals amongst them who could. I would not like to say the proportion, but in my experience you get one in ten or a dozen who can act as interpreter.

21853. When a man comes to be sufficiently acquainted with the language to understand what is said to him, your objection would vanish ?—Yes.

21854. Are they good workmen ?—Some of them are very good workmen ; others are not. They are brought over and learn by experience.

21855. Do you agree with the views of Mr. Ronaldson that they are very good men, amenable to discipline and very satisfactory ?—I can hardly go the length of Mr. Ronaldson. I believe that they obey orders so far as they understand them fairly well.

21856. With regard to haulage, would you be glad to see some arrangement by which it could be made safer ? —Yes.

21857. And that some expedient should be adopted for preventing tubs running away, and if they do that they should be rendered less dangerous ?—Yes.

21858. (*Mr. Enoch Edwards.*) I want to ask you first of all about this question of firemen and firemen's certificates. Mr. Ellis has been suggesting to you that the second-class certificate might cover a fireman ?—Yes.

21859. When you came here this morning was that what was in your mind—a second-class certificate ?—No ; I was thinking about the nature of the certificate. I had it generally in my mind that they should have a certificate of some kind, indicating their ability for the post.

21860. That is to say, the general manager who is responsible for the pit has a first-class certificate ?—Yes.

21861. His under-manager has a second-class certificate ? —Yes.

21862. There is no provision made to test the capacity of firemen ?—That is so.

21863. In that sense you think this man should in some way pass an examination to qualify him for his duties as a fireman ?—That is what was in my mind.

21864. The position of a fireman in your County would hardly be as onerous and dangerous as in fiery districts ?—It is not as onerous as in Lanarkshire ; the elements are not so pronounced with us : we have few mines where they use safety lamps, but the naked light is very common and of course the black damp. The ventilation and the roof and sides are practically the main duties of the firemen.

21865. Is the coal got mostly by blasting ?—Generally.

21866. Do the firemen fire shots ?—In some collieries there are appointed shot-firers. In most cases the men fire their own shots.

21867. That is where they use naked lights ?—Yes.

21868. Is that rather the explanation of this low wage, because the duties are not so onerous ?—I rather think that it will be an element in it.

21869. That would be a lower wage than they pay in Lanarkshire ?—I could not say how they pay in Lanarkshire, but I anticipate it will.

21870. It is an unusual thing. Perhaps you have not had much experience beyond Ayrshire. It is an unusual thing to pay firemen a less wage than a collier ?—It is a very common thing to pay a fireman a less wage than a collier.

21871. With you ?—Yes.

21872. You said that there was no difficulty in filling these places ?—That is so.

21873. There would be greater difficulty if you had to submit to examination ?—Yes, that goes with it.

21874. Is there any reason to think that these firemen are not competent ?—The attraction for the place is this, that they have a little experience down below and the duties not being onerous they are glad to get this steady wage without having the qualifications that, generally speaking, we think they should have for a fireman's duties.

21875. If the mines were gassy, dry and dusty—— ? —They would be dangerous.

21876. And you would require a better class of firemen ? —That is so.

21877. With regard to the fines that have been imposed, do I understand you to say that they are imposed in Ayrshire in the colliery office ?—Yes, that is so,

21878. You have no fixed degrees of fines ?—No fixed tables.

21879. They are fixed as cases arise ?—They are just the whim of the moment.

21880. Who fixes them ?—The manager.

21881. He does not delegate that work to others, but does it himself ?—Not that I am aware of.

21882. And the man is expected to pay it, whatever it is ?—It is generally deducted from his pay in the office.

21883. Of course it is paid then ?—Yes.

21884. There is not so much difficulty about it then, is there ? Is he a consenting party to it ?—In most cases it has been consented to.

21885. What would happen if he did not consent ?—He would be dismissed probably.

21886. (*Mr. Ratcliffe Ellis*) How do you know that ?—It is the alternative usually.

(*Mr. Enoch Edwards.*) You know from experience what would happen in Ayrshire.

21887. (*Chairman*) Supposing he said "I would rather be prosecuted" ?—They would dismiss him.

21888. He would not be allowed to say "I would rather be prosecuted" If he said "I will not pay the fine," and if that was because he would rather be prosecuted, or for any other reason, he would be dismissed ?—So far as it comes within the scope of my knowledge, I do not think he has had the alternative of prosecution.

21889. If he says "I do not think I am guilty and I will not pay the fine," he would be dismissed ?—That is so.

21890. Supposing he said "I want the case tried in a Court of Law : I want you to prove my guilt" : do you think notwithstanding that he expressed his willingness to let the matter be settled by a Court of Law, still the management would dismiss him ? That is your belief ?—I am inclined to think that.

21891. You do not know of a case where a man has said "I do not believe I am guilty : I want my case tried in a Court of Law" ?—No case has come before me.

21892. (*Mr Enoch Edwards.*) There are a number of fines imposed in your district ?—That is so.

21893. Your men object to fines I take it ?—They do.

21894. They would prefer, if there is a case, that they should be prosecuted in a court ?—That is the general feeling.

21895. Are there many prosecutions in court now ?—I have not taken a note of the number ; they generally appear in our inspector's report.

21896. In the inspector's report which I have before me you form one quarter of the whole area, and there have been 103 prosecutions during the year, 14 against managers or officials and 89 against workmen, so that so far as discipline and carelessness are concerned they are a very fair proportion—the managers are as bad as the workmen ? —I think we have a fair proportion in Ayrshire.

21897. There are 14 officials and 89 workmen. Have you any knowledge at all, or have you ever heard of a case of a manager being guilty of a breach and the inspector going to the office and asking him to pay a fine in the same way as a workman is asked ?—I have never heard of that.

21898. He would be taken before the court ?—That is so.

21899. They are supposed to do that ?—They are supposed to do that.

21900. Generally speaking, you say your Society encourages men in every way open to you to observe discipline ? —That is so.

21901. They realise that it is to the interest of the men ? —Yes.

21902. It is also essential to their safety that discipline should be observed ?—Yes.

21903. Although it may appear harsh and arbitrary that it should be observed, you agree with that ?—Yes.

Digitized by Google

21904. When you said you defended members summoned for breaches of rules you did it only when you had a belief that the man was innocent?—They asserted their innocence.

21905. Has your Society in Ayrshire ever been driven by the men to the defence of an action when your Society believed it ought not to have been?—No; we have had frequently members of our Society who have been prosecuted, and before coming to the court they admitted their guilt and we had nothing to do with it. Sometimes they asked that they might have a lawyer to plead an extenuating circumstance, but we never condone their conduct or help them.

21906. You would pay for a lawyer after a man confessed he was guilty?—If he said "There is a certain thing I would like someone to put before the Bench" we have gone the length of saying "We will allow a man to put that before the Bench for you."

21907. You pay the lawyer?—Yes, but he pays his own fine.

21908. You realise that it would be rather a serious state of things if there were a shadow of truth in the suggestion that the unions of the country defended men guilty of deliberate breaches of the law which endangered the safety of the mine?—We have never done so.

21909. With reference to the question of workmen's inspection: you said that they had not resorted to it much in Ayrshire?—That is so.

21910. Not more than once or twice so far as you know. Do you suppose it arises out of sheer carelessness and indifference?—Generally, but the fear also operates. Since we began to get our men all gathered into a union we have not tried to enforce that. It has been frequently talked of taking advantage of it, but we have always had before our mind's eye that the fear would continue to operate more or less and we have not taken any steps to have it done.

21911. You are well organised?—Yes.

21912. You are members of the Scotch Miners' Federation?—Yes.

21913. Do you think to-day that if a mine was thought to be dangerous and gassy and your Society agreed to appoint two men, that there is a colliery owner in Ayrshire who would object to it at all?—I do not think they would object to the appointing of the men but what lies behind it is this: if the men happen to report adversely to the managers there is the idea that the manager would take some covert way in the future——

21914. Supposing they reported honestly what they saw. Usually they are accompanied by the under-manager?—Yes.

21915. So that the under-manager would have the same knowledge and be cognisant of it, too?—Yes.

21916. Do you suggest in these days if the men went down and found gas in a place not reported by the fir man and the under manager with them, and it is patent to all three, and that they reported that fact in a book, that the management would take advantage of them for it?—Certainly that feeling obtains.

21917. Do your men think there is the ground for it now that there was 20 or 30 years ago?—Of late years we have not seriously considered it, but the reasons why we think that the liberty should be enlarged in any new legislation is because everything of that kind would be set aside by allowing independent men of experience to do that work.

21918. So that if there is any ground for that in these days your union is not yet altogether omnipotent?—Not altogether.

21919. With regard to the special rules; have there been any special rules adopted in Ayrshire since you have been agent?—I really could not say as to the dates. I have been 16 or 18 years in this position. I am not sure as to the dates of the special rules.

21920. Since that time have the inspectors ever spoken to you about the special rules?—Never.

21921. (*Mr. Ratcliffe Ellis.*) There have been special rules during his time?—The timbering rules, but we never were consulted.

21922. (*Mr. Enoch Edwards.*) Do you suggest that the workmen should be consulted about and be a party to the rules the workmen are expected to observe before they are adopted?—That is so.

21923. When you were asked the distance the inspector had to travel you were familiar with the area of the district he has to inspect?—This particular place?

21924. You know the character of the country included in it?—Yes.

21925. You have some idea of the distance they have to travel?—Yes.

21926. In getting to collieries from your place what are the railway facilities like generally? Are there such things as express trains, or do you have to change at stations, I mean go by slow trains and wait?—In the bulk of our collieries they have to change in nearly every instance. Take for instance going from Glasgow to most of our collieries in the south of Ayrshire, they have to change at Kilmarnock or Ayr, and it perhaps takes an hour from Glasgow to either of these places by express train. More or less they have to wait half-an-hour or one hour for the train again. According to the colliery being visited, it takes anything from half an hour to one hour to get to the colliery again. From, say, Glasgow as a centre it might take, roughly speaking, two or two and a half hours to get to the colliery, and the same to get back again.

21927. A good deal of the inspectors' time is spent in travelling to and fro?—That is so.

21928. You think that if there are more districts and more inspectors that a lot of time would be saved?—Yes, if they were nearer the centre.

21929. In the case of the old man which Mr. Ellis has asked you questions upon, did he work in the pit 40 years?—Yes.

21930. During that time he had seen the inspector three times?—That is his statement.

21931. You were asked if he had worked continuously or whether he was shifted about, and your reply was that he had been shifted about?—I expect he would be more or less in that district, but in different pits.

21932. It may be possible that he worked at one pit and that the inspector visited the pit once a year and did not go into the neighbourhood where this man was working?—That is possible.

21933. The inspectors admit that they do not examine collieries but that they take samples, so that a man may not see an inspector during the whole of his lifetime?—That is quite possible.

21934. (*Mr. F. L. Davis.*) Are there within your knowledge any inspections made by workmen under rule 38?—No, except that case I have cited of the old man many years ago, no case has come within my knowledge.

21935. That is 30 years ago?—Yes.

21936. And the fear has been so great ever since that they have never made an inspection?—We have never cared to do it.

21937. Do you not think that there may be another reason besides the fear of being harshly treated by the management? Do you not think it is possible that it is the hard work which prevents them from doing it?—The hard work involved in the inspection?

21938. Yes?—I do not think so. I think so far as that is concerned, if we could feel assured that nothing in the nature of after consequences would take place there would be no difficulty in getting the inspection. It is not considered very hard work as a rule, making the inspection. The man at the face is working harder than he would be if he was making an inspection.

21939. Do you think you have a very strong case in stating this fear that exists: one case you mentioned 30 years ago, and they have never tried any inspection since?—There may have been cases but they are not present to my mind where they have tried it since. The general feeling is that it would be difficult to get men to do it for that reason.

21940. With regard to the firemen; you stated in your opinion that a large number of the men were incompetent?—That is my belief.

21941. And that the management got these men because they were cheaper?—That is so.

21942. Do you seriously suggest that the manager who is responsible if anything happens will purposely engage an incompetent man as a fireman?—They rely upon the comparative safety of the mine and the fact that they are comparatively free from fire-damp.

21943. Still you have mentioned the condition of the roads, roof and sides and black-damp, and other thing. If anything happens in the mine the manager is responsible?—That is so.

Digitized by Google

Mr. Peter Muir.

12 June 1907

21944. Do you think it is to his interest that he should appoint incompetent men ?—They seem to be dominated by the same feeling as I indicated in regard to the man timbering at the face. They see a chance of saving a little and they are willing to take risks. It seems to me that is at the bottom of it, and the manager, at least the overman who is certificated, is exercising a more or less constant supervision, too.

21945. (*Dr. Haldane.*) You mentioned black-damp as being a common thing in the Ayrshire mines. Does that mean that the lamp burns badly in the air ?—If it is sufficiently thick it goes out. It often occurs where they can work and is what is called bad air or want of ventilation. They can work, but at the same time it is bad for the men.

21946. What sort of mines are these ?—Are they shallow mines chiefly where that occurs ?—It might be anything from 80 to 100 fathoms. We have a few pits beyond that.

21947. They are not very deep ?—No.

21948. Is that black-damp a serious trouble ?—Very serious to the men working in it.

21949. In what way ? What effects are attributed to it ?—It affects his lungs and his general health and shortens his life.

21950. It is said to do so, but have you any reason to suppose that it does ?—There is no question that it does.

21951. Do the men ever get stupid with it. Have you ever heard of that ?—I have never heard of them getting stupid, but I have heard many a time complaints.

21952. That is unpleasant ?—Unpleasant and painful.

21953. In what way ?—Sore heads and the like of that if working in it.

21954. I suppose you are aware that the inspectors have sometimes considerable difficulty in dealing with bad ventilation of that kind ?—That is so.

21955. Where there is no cap shown on the lamp, only that the lamp burns badly ?—That is so.

21956. There is no definite standard of purity for the air ?—I rather think it is a matter of opinion for the inspector.

21957. Yes, but the inspectors say they have nothing definite to go by, and have a difficulty in bringing these cases into court ?—We had a very pronounced case five or six years ago. It was brought into court by Mr. Ronaldson, and although it was understood on every hand that the ventilation was excessively bad, because he had not bottled up some and analysed it, the management got off free.

21958. Because he had not done that ?—Yes.

21959. Supposing he had would he have been in any better case because the law says nothing ?—That was the plea the Sheriff made for allowing the management to get off in that case, that he ought to have brought a sample of the air complained about.

21960. You are clearly of opinion that it is a somewhat serious matter—I mean this black-damp in Ayrshire ?—Yes.

21961. And that it is not satisfactorily dealt with at present ?—No.

21962. It cannot be satisfactorily dealt with ?—That is so.

21693. Or at any rate, is not ?—In my opinion if the firemen themselves were a little more independent of their relationship with the employers it might be helpful in that direction.

21964. You mean to say that firemen would always detect this black-damp ?—That is so.

21965. Do you know if any explosions have ever happened through men mistaking black-damp for fire-damp ? —I cannot point to any just now.

21966. You are aware that it is a source of danger, where there is a mixture of the two gases together, and men may very well be deceived. People think something which really is fire-damp, black-damp ?—Black-damp shows differently in the light.

21967. Yes, but when you have a mixture of the two it is rather a difficulty. It is one of the dangers of black-damp that you may make a mistake with it. You have said you are of opinion that firemen are paid too little in many Scotch mines ?—Yes.

21968. Considering their responsibilities ?—That is so.

21969. Have you ever heard another complaint which once or twice has been made to me that the managers are often paid too little in Scotland ?—That does not come in our direction.

21970. It would be a very serious matter if it were true in the interests of safety and everything else. I did not know whether that question had ever come up. As regards foreigners you have no complaint as regards the quality of the men. You are not of opinion on the whole that there is an inferior class of men being brought into the country and that there is a danger from that ?—I know from my experience that some of them are very good men, but I believe in regard to the Poles that these are in the minority.

21971. Apart from their knowledge of mining altogether, you do not think they are a very inferior class that are coming into the country in this way ?—I could not say as to that, because you are not able to——

21972. It is difficult to judge ?—Yes.

21973. That is not the general impression, that they are a very inferior class ?—There is a feeling amongst our natives that they are not up to the standard that they ought to be.

21974. They are not up to the standard of these Germans you were speaking of ?—No, not even to them.

21975. They have no objection to them as foreigners ? —That is so.

21976. Their objections are based first on not understanding the language and being a source of danger ?—That is the principal and main objection.

21977. And that some of them are rather inferior men that it is not desirable to have ?—I think that obtains generally amongst the Poles. The few experienced men get these inexperienced men cheap.

21978. You are aware that in many foreign mines, and in English and Cornish mines for that matter, there are arrangements made so that the men can change their pit clothes and have a bath at the pit-head. Have you considered the desirability of that matter ?—I have been looking at the question, and I feel it would raise the status of the men morally and physically if some simple arrangement could be brought into play whereby cleanliness when they come up from the pit could be obtained, all the more so because their homes are not suitable for getting that as it should be.

21979. Have you ever heard that it produces much discomfort to the man's wife and family when he comes home in his pit clothes and has to change them and wash at home ?—It cannot do otherwise than produce discomfort in the home where it is one single apartment, and at the most two, which is a common thing.

21980. Do you say it is a common thing to have one room in a miner's house ?—It was very common in Ayrshire. It is not so common now. The general thing now is two.

21981. Are there any houses built now with only one room ?—Not now, but the old miners' rows, many of them, are single apartments. I believe there are hundreds in Ayrshire.

21982. What time would these houses be built ?—Any thing from 30 to 40 years ago, but the latest, I must admit, are an improvement.

21983. Are they ever built with bath-rooms ?—No bath-rooms of any kind.

21984. They are never built with bath-rooms ?—Never; just the room and kitchen, and they are both used for sleeping apartments.

21985. The common thing is two rooms in a house, and no bath-room ?—Yes.

21986. (*Chairman.*) You said that there is a common feeling among the miners that the discipline is too strict ? —That has been expressed many a time. I do not say that it is well-founded, but the men themselves think that they could do with a little less of it.

21987. They come to you with complaints that the Special Rules are unnecessarily enforced, or what is the complaint they bring to you ?—It has generally arisen from the enforcement of the Special Rules.

21988. Has your Union ever taken up the point that a Special Rule is unnecessary, and ought to be done away with ? Have they ever urged that upon the management ? —No, we have never raised the question as to the relaxation of the Rules in any way.

Digitized by Google

21989. Although you have been asked by the men?—Individuals, whenever they have felt the pinch, have come to us.

21990. The men have not come in a body and said: "We consider that such and such a Rule is irksome and unnecessary"?—No.

21991. It is only in individual cases that a man feels harshly treated and makes objection to the Rule?—Yes.

21992. Is there any particular Special Rule that the miners object to? Do you know of any Rule?—The main objection has hitherto been centred round the timbering.

21993. That is to say, they do not like to be in any way interfered with. Each collier considers that he has a right to put up what timber he pleases, and shall not be dictated to as to what he shall put up?—The complaint that has reached us oftenest is as to the conditions of putting up timbering where it has interfered very seriously with the ability to get coal.

21994. (*Mr. Ratcliffe Ellis.*) Too near the face?—Yes.

21995. (*Chairman.*) Do they object because it is too much trouble to put up the timber or because it interferes with their working?—Because it interferes with their working.

21996. To go on with this question of timbering, Mr. Ellis suggested that the question involved was simply a question of wages. In point of fact, is there not a question of safety involved? If these men are so ill-advised as to object to any systematic form of timbering, is it not time that some person was put in authority who should be himself responsible for timbering and see that proper timbering was put up, whatever the hewers might think?—I think I have stated that already: that an independent man is essential, because the individual at the working face is so anxious to get his darg, that is—his full day's work—that he is willing to risk something and grumble when he is interfered with.

21997. It is a question of safety, and not only a question of wages as to how far a working hewer at the face should be interfered with in the matter?—That is so.

21998. You are strongly of opinion in the interests of safety that he ought to be interfered with, and that some person should have authority to dictate to him what timber he should put up?—That is so.

21999. You say that the firemen should be placed in a more independent position?—Yes.

22000. What do you mean by "a more independent position"?—I might explain better by one case that come before me. I do not want to locate the time too closely, but it is less than five years ago. A fireman told me he was dismissed because he was in the habit of marking the book too frequently, and when the place was not safe of sending the men home. The management wanted the men to work, he alleged, and take a little risk. That man is still acting as fireman in a different colliery, and the conviction that we have is that the firemen should be independent enough to do their duty without fear or favour from the men or the employers.

22001. How would you manage that?—By having the Home Office or some other party who to some extent would be allowed to intervene in matters of this kind.

22002. That a fireman ought to be able to appeal from what he considered a wrongful dismissal; you mean something of that sort?—Yes.

22003. I understand some of the miners consider that it is extremely desirable that the firemen should in no way help the management in the general conduct of the mine, that is to say, that their duties ought to be entirely confined to looking after the safety of the mine, and that they ought not to have charge of the trams or anything of that sort, that they ought not to have the general conduct of the mine in any way. Their simple duty should be to see that all is safe and they ought to have nothing to do with regard to any of the suggestions made by the management, for getting more coal, or for working the mine at a greater profit. Nothing that has reference to money or wages or greater output ought to be within the jurisdiction of the fireman at all. They ought to do nothing with regard to the way the mine is conducted, except with a sole view to safeguarding the lives of the men?—In carrying out their statutory obligations they are compelled sometimes to send men home.

22004. That I understand. No doubt you cannot prevent the firemen having to do that occasionally and coming and getting into the bad books of the management, and, as the management considers, too frequently. That no doubt is a serious matter, about which I was not asking. I was asking about another point of the same character as to the duties of the fireman. We quite agree his duties are to send the men away from work, and that the management may object, and think that they are unnecessarily sent away, and the men also. It has been suggested to us that the firemen are sometimes appointed not only, and possibly not principally, with a view to the safety of the mine, but with a view to their being persons who could get the best work out of the men, and see that the mine was worked at its greatest possible profit. They have charge, for instance, of the trams, and see that the loading is what it should be, and they would perhaps report a man if he put in too much small coal, or something of that sort, which has nothing to do with safety, but only the management of the mine. That is the suggestion, I understand?—I believe in Ayrshire the pits are small, and firemen have varied duties. They are not onerous enough to simply allow them to confine themselves to their duties.

22005. You think in the small pits it is natural and proper that the firemen should not only look after the safety of the miners, but also bear some part in the general management of the mine?—That might be necessary in the case of a very small pit.

22006. With regard to inspection by the men under Rule 38, it was put to you by Mr. Ellis that the men in the mine themselves at work were the best men to make the inspection?—Yes.

22007. You said probably that might be so. I should like to put another view, whether it might not be advisable to send men down mines who had a much larger experience of the general conduct of business underground than the men who have worked in a particular pit all their lives Do you not think it advisable to have a workman who is extremely well qualified and has a first-class certificate and has possibly worked in other mines in Durham or other parts of the country, because he might, from his experience in other mines, be qualified to make suggestions that would never occur to a man who had only worked in a particular pit all his life?—The inference is in that direction, that he would be able to make suggestions that would conduce to safety.

22008. You might have a very superior man who would be better capable of conducting these examinations, although he had never been working in the particular pit in question. He might make better suggestions and be better fitted to carry out that examination than a man who had spent his whole life in the pit?—In admitting that the man with experience of that particular seam would have probably the best knowledge, I believe he would so far as danger was concerned, but the man with a wide experience might be able to suggest from his wider experience what was necessary.

22009. You would send two men down at a time?—Yes.

22010. One might be a man of general experience and the other a miner who had worked in that particular seam?—That is so; meantime we cannot do that according to law.

22011. You can according to law; there is nothing to prevent you according to law from authorising any working miner who has practical experience in mines going down any mines you please?—Who is working in the mine.

22012. No, in any mine. Anybody working in any mine in the United Kingdom can be sent down the mines by your men if they like to do it. That is the law, and it is just as well that you should know it, I think. You are under the impression that you cannot send a man to inspect for you under this Clause 38 unless he has been working in the actual pit?—That is so.

(*Chairman.*) That is not the law.

(*Dr. Haldane.*) Unless he is actually at work as a miner. Is that not the point? That was the point raised yesterday.

22013. (*Chairman.*) I understood Mr. Muir to say that it would be impossible to get a man of general experience even, although at the moment a working collier, because he had never worked in that particular pit?—That is my impression.

22014. You may take it that is not so. If you think it proper and desirable, you may send any working miner wherever he comes from down any of your pits. You would be satisfied with regard to the Special Rules with Mr. Ellis's suggestion that before a rule was put into operation it should be advertised, and that the men should have an opportunity of expressing their objections. It has been suggested that possibly something more might be done

Digitized by Google

Mr. Peter Muir.

12 June 1907

with a view of bringing the masters and men together at an earlier period, and when the masters wish to advertise a rule, before advertising it and committing themselves to the proposition that in their opinion a rule was a good one, there should be a previous conference between the masters and the men, that is to say, the masters think a certain Special Rule should be put into operation and before advertising it to let the public know of that opinion, that they should take the men into their confidence and ask them previously what they think of it. Do you think that that would be an improvement?—I could not go the whole way of approving of that as an improvement. My feeling was that the thing should be submitted to the men after being arranged by the employers and the Home Office, and I thought there would be still a power to change it, but having committed themselves there would be more difficulty in making the change.

22015. That is my suggestion, that it might be as well to bring masters and men together for the consideration of Special Rules at the earliest possible moment?—That is so.

22016. (*Mr. Ratcliffe Ellis.*) With reference to the providing of baths at the collieries which you think would be a very desirable thing in the interests of the men, would you see any objection or do you suppose that the men would object to pay some small charge for the use of them, or is your idea that they should be provided at the expense of the coal owners?—I think the expense would be so trifling that it would be hardly worth making it an obstacle whether it was paid by the employer or by the men, or jointly.

22017. Do you see any objection to the men making a contribution in the way of a small charge?—I do not see any objection. My opinion is the cost would be so small that for the convenience and benefit nobody would think it worth while to make objections.

22018. Supposing they did, do you think the men would object if they used the baths? They would have the option of using them or not, but do you think that those who desired to use them would object to paying a small charge?—No, I do not.

22019. (*Mr. Smillie.*) Mr. Ellis put it to you that men employed in a mine were in a better position to make an examination under Rule 38 as compared with men who were not employed in the mine, and you agreed with him. Will you tell the Commission why that is so. Under the Mines Act a miner is not entitled to go into any part of the mine but his own working place, and if found outside he is guilty of a breach of the Special Rules?—Yes.

22020. How is he placed in a superior position to make an examination of that mine as compared with a person who works in another mine?—It was only because there is knowledge gained from his experience that I assented to it.

22021. His experience in his own working place you mean?—Yes.

22022. Miners generally in Ayrshire or Lanarkshire or any other part of Scotland have a general experience, of the various seams?—That is so.

22023. So that there is not a great deal in the fact that a person is employed in a particular mine to justify his appointment specially as an inspector for that mine?—No, the disadvantages on the other side outweigh that.

22024. In these inspections it is understood that an official of the mine must go round with the persons appointed as inspectors?—Yes.

22025. In order to point out every part of the mine to them?—That is so.

22026. I would like to emphasise the question of the baths and the benefit they would be. Many of your mines in Ayrshire are wet mines?—Yes.

22027. Men come up the pit at night drenched to the skin with water, and in many cases they have to travel a considerable distance home?—That is so.

22028. Do you think that is injurious to their health?—Most injurious, in the winter time especially. I have wondered, sometimes meeting them, how they survive it.

22029. From that point of view it would be a great benefit to the health of the miners to have some provision made?—Unmistakeably.

22030. You said that there were a few hundred single apartment houses you thought still in Ayrshire, but would there not be over 1,000 single-apartment houses in Ayrshire—I mean in the villages in which the miners live?—It would be difficult to give to an exactness the number, but I would be safe in stating that there are hundreds of single-apartment houses.

22031. Do you know any cases in the past few years in which employers have built up a passage and turned one single apartment into two apartments?—My experience rather goes the other way, where they have knocked down a partition.

22032. And made two single apartments into one?—Yes.

22033. You do not know any other cases where they have divided them?—None to my knowledge in Ayrshire.

22034. Do you know any cases in which they take in a lodger in the single apartment houses in order to help to pay?—That is quite common.

22035. Not only the lodger, but the family are in the single apartment?—Yes.

22036. As a matter of fact it must be a very trying duty on the part of the women where two or three sets of pit clothes have to be dried round a common fire?—That is unmistakeably so.

22037. That is a very regular thing at the present time?—That is so.

22038. As a matter of fact, you do not think there would be any real objection to paying if necessary a part of the expense?—I am simply giving it as my personal opinion, because that would be subject to the question being put before the men if it became part of a practical working out. My opinion is that I think it would be so infinitesimal that for the comforts and the benefits derived no single man would scruple.

22039. From a health point of view you think yourself that it would be worth any cost to the workmen or employers that was necessary?—Yes.

Mr. Robert Brown, called and examined.

Mr. Robert Brown.

22040. (*Mr. Smillie.*) You are Secretary of the Scottish Miners' Federation?—Yes.

22041. You have had a very long experience as a working miner in underground work?—Yes.

22042. Will you tell the Commission how many years you were working continuously underground?—31 years 3 months.

22043. In all classes of mining work?—Yes.

22044. Your experience in mining has not been confined to Midlothian?—Principally.

22045. You have been a miner in America?—Yes, I was in the States 20 months.

22046. (*Chairman.*) When were you last underground?—16 years ago.

22047. (*Mr. Smillie.*) Have you had any experience of other parts of Scotland or England?—No, principally in Mid and East Lothian.

22048. You have been in nearly every mining district in Scotland, attending meetings or dealing with disputes?—Yes.

22049. You know the Scottish miner fairly well?—Yes.

22050. Does your experience lead you to think that there is a very considerable want of discipline amongst the Scottish miners as compared with other miners in the country?—No, I cannot say it does.

22051. Do you think the Scottish miner is a fairly well trained person, not only in mining but in manners, as manners amongst miners go?—So far as I have been able to judge they compare favourably in all respects with other miners or other workmen.

22052. In intelligence and discipline, so far as their work underground is concerned?—Yes.

22053. I understand that you have had your attention called to the evidence given by the mines inspector in which he charges the Scottish miners with not being amenable to discipline?—That refers to Mr. Ronaldson.

Digitized by Google

22054. That does not extend to Mid and East Lothian ?—No.

22055. Mr. McLaren is the chief inspector for the Mid and East Lothian District ?—Yes.

22056. Do you know if it is a common thing for the Miners' Association of Scotland to defend miners charged with a breach of the Coal Mines Regulation Act ?—No, we do not do it in our district ; at least I have never known of it being done.

22057. In your district ?—In our district.

22058. Are you aware whether it is a common thing in other districts ?—No. If any miner approached us and requested that we should protect him when he has been prosecuted for any breach of the Special Rules we usually investigate the case, and if we find in our opinion that he has been guilty of a breach of a Rule we do not protect him at all. We tell him he is entitled to be prosecuted.

22059. If you were of opinion that a person charged with a breach of the Coal Mines Regulation Act was clearly not guilty of it, and he was a member of your Association, you would not think that it was at all encouraging want of discipline to defend him in a case of that kind ?—We defended a case recently, and I was present in court where the man was charged with a breach of a rule in going into a pony trip. The man explained to me that he was in the lie, and there was a full trip and an empty trip and another pony trip being sent away, and he had to jump in to save being jambed, and immediately he leaped in the pony trip was taken off and the man was charged with a breach of the rule, and he had to do this to prevent himself being jambed. He got off, and it was held that he had only done that to save himself, and that it was not a breach of the rule.

22060. You defended in that case, and you felt justified in defending in a case of that kind ?—Yes.

22061. I notice you are of opinion that an additional staff of mines inspectors is required if we are to have a thorough inspection of the mines ?—I think it is requisite that the staff should be increased.

22062. Do you know to what extent inspection is carried on at the present time ?—Is there at the present time any systematic inspection of mines carried out in Scotland ?—So far as I am aware there is not. It is rather this : I feel when an accident takes place at a mine that they make an inspection of the parts where especially the accident has occurred, but I do not think that there is any systematic form of inspection.

22063. Was your 30 odd years underground spent chiefly in one or two collieries ?—No, I was in several collieries. I was in the shale works apart from the coal mines.

22064. Do you remember how many ins ectors you have seen underground in your experience ?—So far as my memory serves me I have only seen an inspector in the mine three times during all my experience.

22065. If a thorough inspection of the mine was being made during the time you were working there, you would have had a very good chance of seeing the inspector ?—Yes.

22066. Was a thorough inspection being made, as far as you know, upon those occasions when you have seen the inspector, or was he there because of an accident ?—Just because of an accident.

22067. On all three occasions ?—Yes.

22068. You never remember an inspection of a mine being made which you were working at ?—No.

22069. Your impression now is that the inspectors' duties, when they are inspecting, are chiefly concerned with accidents that have taken place ?—That is my impression.

22070. If their attention is called to any special danger you have no fault to find with their inspection ?—No. I think any time I have had occasion to call Mr. McLaren's attention to anything he has given attention to it very readily.

22071. You do not think that the present method of inspection is satisfactory ?—No.

22072. Chiefly because of the inability of the present staff of inspectors to inspect the mines ?—Yes.

22073. You propose that there shall be a considerable increase to the present staff of inspectors ?—Yes.

22074. Could you suggest to the Commission how many inspectors would be required, or how many men under ordinary conditions would be sufficient for an inspector to devote his whole time to the work ?—With regard to the present staff—I am speaking for the East of Scotland district, where we have three inspectors—I should think they should be trebled to make an inspection, say, once every four months.

22075–6. You would require three times as many inspectors for the East of Scotland division ?—Yes.

22077. The present inspection is not an inspection, but a sampling of the mines. Would you mean an inspection every four months to be the present kind of inspection ?—I have it from Mr. McLaren's report that they have inspected every mine in his district at least once. He says that it is an inspection. All I want is inspection, too. If he can do it once a year I want it done once every four months.

22078. (*Chairman.*) You are satisfied with the inspection as carried out by Mr. McLaren ; you are satisfied that the inspection he has made is the kind of inspection you desire ?—It all depends how he may define an inspection against my definition.

22079. What is your definition ?—My definition is that the whole of the mine should be inspected in every part. I do not know whether Mr. McLaren's definition goes that length or not. If it does then I agree with treble the number.

22080. If he and his assistants only make a partial inspection, you want more than three times the number of inspectors ?—Yes, if only a partial inspection, but he does not state so.

22081. (*Mr. Smillie.*) It is admitted by the inspectors that generally they only sample the collieries ?—Yes.

22082. They feel they are not supposed to make a thorough examination of all collieries. That would change your views as to the number ?—Certainly. I have his report and he states that they have made an examination of every mine during the twelve months, and some of the principal mines more so. I take it that was an inspection, but if it is only inspecting part, then it would take more than treble to make an examination every four months such as, I think, ought to be done.

22083. You have mines in which there are a considerable number of men employed ?—Yes.

22084. There are 500 in some cases ?—We have one colliery within six miles of Edinburgh in which, I think, there are over 1,000 men employed. It belongs to the Lothian Coal Company.

22085. Supposing the inspector was called to inspect where a fatal accident had taken place, and went straight there and came up again after an examination of that place, you would not call that an inspection according to your definition of what an inspection should be ?—No.

22086. If that is one of the inspections Mr. McLaren refers to, that is not an inspection according to your view ?—No.

22087. Would you still think if three inspectors at the present time have only managed for the first time, I think, for years, to reach all the mines under their jurisdiction and make a cursory examination of most of them, that three times the number would not be able to carry out an inspection every four months ?—No, they could not overtake the work.

22088. Do you think a thorough inspection of all mines is necessary every four months at least ?—Yes.

22089. Do you suggest that the staff of inspectors should be increased in order to enable them to do that ?—Yes.

22090. Is there any particular class of men you think should be appointed as assistant inspectors for that duty ?—I think that the men should have theoretical and practical knowledge combined. It would be a great benefit in that direction, and that they should have the practical experience to enable them to make a thorough inspection.

22091. Will you define "practical experience" ? Would that be covered by a person being a surveyor and down the colliery surveying once or twice a week for five years ?—No.

22092. That is not what you mean by practical experience ?—No.

22093. You mean practical experience either as a working miner or as a fireman or roadsman, or some other class of workman in the mine ?—What I mean by practical experience is that a man should have the experience by which he would gain some knowledge as to the nature of the roof and the coal to be worked, so as to be able to suggest improvements even in the working of the seams and other things to obviate accidents.

Digitized by Google

Mr. Robert Brown.

12 June 1907

22094. You are aware, at the present time, a person sitting for a manager's certificate or an under-manager's certificate must have had five years' experience underground —Yes.

22095. Are you aware that persons who have never had any experience of working underground are eligible for that examination?—I have known that men would put in their five years, and they have been in the pit during that period of time, but they have not had any practical experience, so far as I would define practical experience as a miner.

22096. Surveying daily two or three times a week covers that, and enables them to take their certificates?—Yes, and sometimes measuring up.

(*Mr. Ratcliffe Ellis.*) I do not agree with that view.

22097. (*Mr. Smillie.*) Do you want a new grade of assistant inspectors?—With regard to the experience that they gain now it has been within my knowledge that the custom in our district is that a young man will be engaged by a company; he will be five years there and will be down surveying, and they will utilise him to measure the places of the working man, and working forward in a colliery, keeping time, and other things, and putting in his five years, but that is not the experience I want. I want the same experience as I have had, to dig coal and to work at the coal face, practical experience, so that he will know something of the nature of the roof and the coal with a view to knowing the best means for safety in the production of the coal.

22098. You think that the Government should appoint a sufficient number of that class of inspectors to enable those examinations, which you have suggested, to be made?—Yes.

22099. Do you consider that they would be in the interests of safety underground?—Yes.

22100. You are of opinion that mines inspection, although it has not been adequate, has tended to greater safety underground?—I think it has.

22101. If it were removed, the probability is that the danger would be increased?—Yes.

22102. You believe that additional inspection would tend to still greater safety?—Yes.

22103. Inspection by men under General Rule 38 you are anxious should be so altered as to read that the men should have the right to appoint inspectors who were or had been practical working miners?—Yes.

22104. That would satisfy you?—Yes.

22105. That rule is not much taken advantage of at the present time?—No.

22106. You believe that it would be more taken advantage of if the men had the right to appoint persons who had been practical working miners?—Yes, I think it would.

22107. I notice that you are in favour of the officials who do the inspection on behalf of the company underground, that is the firemen, passing an examination as to competency before being employed as firemen?—Yes.

22108. May we take it that in your opinion the fireman is one of the most important positions about a mine?—Yes.

22109. The safety of the workmen is in the hands of the fireman to quite as great an extent, if not a greater extent, than the manager?—Yes. I think the fireman making an inspection in the morning is in the most important position with regard to the curtailment of accidents taking place, even more so than the mines inspector in the higher grade.

22110. A careful examination of the mine in the morning by a competent fireman tends to greater safety than inspection by Government inspectors?—Yes.

22111. And the best class of man should be secured for that who has a thorough practical and theoretical knowledge of their duties?—Yes.

22112. Have you any idea as to whether or not the districts which firemen have at the present time are too large for them to thoroughly make an examination of?—Yes, they have too large an area to cover in the morning to make a thorough examination of the roofs and sides of the travelling roads and the working places.

22113. Was it your own experience that the general examination in the morning by the fireman is an examination of the faces only, and not of all the roads leading to and from the faces?—My own opinion is simply this, and I am speaking of non-fiery districts, that it was simply going round with a piece of chalk in their hands and putting the date of the day of the month on the coal face.

22114. But not making a thorough examination?—No.

22115. I notice that you want some provision whereby men employed as firemen cannot be removed or dismissed from their employment by the manager before full enquiry has been made on behalf of the Home Office to show that the dismissal was justified. Why do you make such a proposal as that?—We wish to place the inspector in as independent a position as possible, so that he will have a real inspection and make a proper report.

22116. That is the fireman?—Yes, the fireman inspector.

22117. You want to place the fireman in an independent position in order that he can give an honest report on the condition of matters as he finds them?—Yes.

22118. Have you any reason to believe that is not done at the present time?—We have had several complaints from the men that it has been reported to them that the ventilation was all right, and the men, of course, in their own judgment, came to the conclusion that it was not as it should be to work in, and they would stop working and could not get up the shaft because the report of the fireman certified that the ventilation was good.

22119. Is it your opinion at the present time that many of the firemen are afraid to give a true report because of the danger of losing their position?—That is the feeling prevailing in the mining districts, that if the fireman gives a true report that was a means of stopping the colliery for a day it would be uncomfortable for him.

22120. That is the general feeling?—Yes.

22121. With regard to the Special Rules you think that in the drafting of Special Rules the workmen should have a voice?—Yes.

22122. Is that because the Special Rules are supposed to be for the safety of the workmen?—Yes. I think that he has even a greater interest than any other party in seeing that proper Special Rules are drafted for his own guidance and for carrying out the work.

22123. In the interest of safety and general comfort underground?—Yes.

22124. You think representatives of employers and workmen should meet together and discuss new rules before they are established?—Yes.

22125. Do you think if that were done and the employers' and workmen's representatives ultimately agreed on the rules, that they would be more likely to be carried out than if the workman had no voice in the drafting of them at all?—I think it would have a tendency in that direction.

22126. Do you, as a miners' agent, impress upon the workmen the necessity of carrying out the Special Rules and the Coal Mines Regulation Act?—Yes: whenever an opportunity arises for doing so I always impress upon them to observe the Special Rules in the interests of safety.

22127. You say where it is practicable that special men should be appointed for propping or timbering. Do you mean them to do the timbering or supervise the timbering being done by the workmen at the face?—Either that, or both.

22128. Would you have one system applicable to all the mines, or would you leave it open to have one or the other system, either that the employer appointed men to do the propping or men to supervise the doing of the propping?—In my own experience circumstances vary so much that I would leave it an open question as to how it could be carried out in a practical form. I understand in longwall workings where there may be a bad roof and a danger to work, there may be section walls, and men to supervise that section and to see to the roof and instruct the men to do it, and give general directions for the safety of the men.

22129. If any new mining legislation was established which took a part of the work at present performed by the miner off his shoulders and placed it on the shoulders of the men employed by the employer, the probability is that there would be a re-arrangement of prices. That has been the general experience of the mining community?—Yes; if there is a change in the nature of the work there is a change in the rates.

22130. You, as a leader, would not object to a re-arrangement taking place providing that the cause of the re-arrangement was the safety of the workmen?—No. We are dealing with re-arrangements every day.

22131. It would not be lessening the miners' wages. Supposing the propping was taken by the employer and an equivalent price taken off for the propping, it would not lessen the miner's wages; he would be enabled to produce rather more coal?—It would simply be a matter of adjustment.

Digitized by Google

22132. That would be a matter for the workmen and the employer ?—Yes.

22133. It is sometimes said by miners that men working at the coal face are best able to do their own propping, because of their special knowledge of the working place. That is the general feeling of the miner, is it not ?—As a rule the miner prides himself on his own qualifications, and thinks he knows best. Sometimes they are so sure of that they are too confident.

22134. And very often they are so confident that they wait until a stone falls on them ?—Yes.

22135. Would the same experience not be gained by a man specially appointed to supervise the timbering, or do the timbering himself ? Would not he have more experience ultimately than the man working at the coal face ?—Yes, if specially appointed for that purpose, but there is another factor ; miners as a rule work at piece rates, and they will sometimes run risks through being in the face of danger continually. I have seen it in longwall workings where a considerable width is on either side of the road where the coal is put into the hutch. Taking it down away from the far-away end of the place they will allow the props to remain unset until they get all the coal down, so that it will make it easier work, whereas if the props were put up there is more difficulty in getting the coal down. If there was a man to see the props were put up he would insist upon it being done at the present time.

22136. You propose to abolish piecework and pay coal getters by the day ?—Yes.

22137. Are you of opinion that that would lessen considerably the number of accidents from falls of roof and sides ?—That is so.

22138. Are you of opinion that would do more than anything which legislation can do to prevent accidents ?—I think it would prevent quite a number of accidents at the coal face, and in our district some 68 per cent. of fatal accidents take place at the working face by falls of roof and sides.

22139. Many of the accidents which take place now at the working face are really the result of anxiety on the part of men to produce the day's work ?—Yes, and to keep pace with their neighbour.

22140. (*Chairman.*) Do you speak for your Federation when you suggest that piecework should be done away with, or is it only your own opinion ?—I understand that it is the opinion of the Scottish Federation.

22141. It is the opinion of the Scottish Federation, and you are speaking for the Federation when you say that ?—Yes.

22142. (*Mr. Smillie.*) You are in favour of every precaution being taken which experience can dictate so far as haulage is concerned, to prevent haulage accidents ?—Yes.

22143. You think where any method of preventing accidents has proved a success, that that should be incorporated in an Act of Parliament and should be made compulsory ?—Yes.

22144. With regard to certificates for engine-winders, do you think it would be an additional precaution in the interests of safety that engine-winders should have a certificate of competency ?—Yes, I think they should.

22145. Of course you have no fault to find with the general body of engine-winders in the country ; they are a steady, competent class of men ?—I think also that there should be two winding enginemen on every engine when men are being raised or lowered in the shaft.

22146. Many men may be in the shaft in your largest colliery at the same time ascending and descending ?—We may have 96 men on the two cages. I think I am right in saying it can be 48 on one cage, and if raising and lowering at the same time when the shift is changing, there may be 96 men in the shaft.

22147. (*Mr. F. L. Davis.*) Are there two decks ?—Yes ; they draw 12 hutches of coal in one cage at Lady Victoria.

22148. (*Mr. Smillie.*) Do you know if there is any mechanical appliance to stop the engine in the event of anything going wrong with the engine-winder ?—I do not think there is.

22149. You would be favourable to the compulsory adoption of any method which had been proved successful in stopping the engine in the event of anything going wrong with the engine-winder ?—I think any approved method for safety should be adopted by compulsion.

22150. You think that it will be more necessary in the future than in the past that two winding enginemen should be in the engine-house when men are raised or lowered, because of the increased number of men on the cage now ?—Yes, and the depth of the shaft, and the size of the engines ; anything may go wrong with the enginemen while these men are in the shaft.

22151. (*Mr. Ratcliffe Ellis.*) You have not been working down below for many years ?—Not for sixteen years.

22152. You have from time to time occasion to go down the mines now ?—I am never down now.

22153. Your information as to the present state of things is from what you are told ?—Yes.

22154. An inspector spoke very strongly of the want of discipline among the men. You do not agree with that altogether ; you think, from your experience of this place compared with other places, it is neither better nor worse than it is elsewhere ?—Quite so.

22155. With regard to Government inspection, do you think there is any one class of mine which it is less necessary to inspect than another ?—No, I think every mine should be inspected thoroughly.

22156. You do not think there is any difference between one and the other ?—No.

22157. Your view of an inspection is the examination of every part of a mine where the men are at work ?—Yes ; and also in other parts of the mine where men may not be at work, such as airways and aircourses.

22158. Take the mine you are speaking of, where 1,000 men are employed underground. Have you any idea of the area of the workings that would have to be inspected there ?—They extend to a considerable extent.

22159. What length of time do you think it would take one man to examine those workings in the way you think the examination ought to be made ?—I think it would take a man a week to examine the Lady Victoria pit as it should be done.

22160. Of course it would not be necessary for one man to do it ; two or three men might do it ?—I would prefer that one man should finish the examination of one pit.

22161. And it would take him a week to do that ?—Yes.

22162. If you took all the collieries in your district, how long would it take for this examination throughout the whole of the collieries ?—I dealt with the East Scotland District, where there were from 50,000 to 60,000—that is the district under the care of Mr. McLaren and his two assistants. In this pit you are dealing with there are about 1,000 men employed, so that if the same area had to be covered in proportion there would be about 50 times the same amount.

22163. If it took a week in that case, then you would want a year to make one examination ?—It would take a week to examine that mine thoroughly, I feel.

22164. And 50 times that would be about a year ?—Quite so.

22165. According to your examination, it would take one man 12 months to make a complete examination of the whole of the mines in your district ?—While it would take one man a week to examine a pit employing 1,000 men, it would not work out in proportion according to the number of men employed in the pit ; and we are only taking the number of men employed in the district under Mr. McLaren's charge. I can quite imagine a pit employing 200 or 300 men, and it would take only two or three days to do it thoroughly.

22166. It would take a long time to examine all the pits as you suggest ?—Yes.

22167. You think inspectors should be appointed sufficient in number to do that ?—Yes.

22168. Have you calculated whether one inspector to every 10,000 persons employed would be able to do it ?—I think one in every 10,000 could do it.

22169. Have you any idea how many it would require ?—It would not work out properly, taking the number of men employed, because there may be less or more in different mines ; and one mine with fewer men employed might be as difficult to examine as a mine with probably double the number. I will put it I think it should be done once every three or four months at the least, whatever number it should take to do it.

22170. You think that men qualifying for inspectors should be men of practical experience, and you want them to have scientific knowledge as well ; I think you put it

Digitized by Google

Mr. Robert Brown.

12 June 1907

theoretical knowledge ?—I take it our inspectors now have theoretical knowledge, and I would like practical knowledge to accompany it.

22171. Do you think there should be one man with practical knowledge and another with theoretical knowledge, or that one man should have both theoretical and practical knowledge ?—I think, with respect to any additional inspectors appointed, it would be to their advantage to have practical experience.

22172. Do I understand you would confine the office of an inspector to a person who had actually worked at the face, or as a workman in the mine ?—Yes, I think it should be confined to that—they should gain that experience.

22173. Now five years' experience with theoretical knowledge is sufficient for the manager, the man who has the sole responsibility of the mine ?—It may be sufficient so far as he is concerned ; it is not sufficient, in my opinion. I think even as a manager he would be all the better for having practical experience.

22174. Supposing a person has been in the habit of going down the mine every day, not merely surveying, but looking into the management, as, for instance, a fireman, does it matter what class he belongs to if he gets that experience ?—He cannot get the experience I want unless he has actually worked or been at work in the face.

22175. You come to the conclusion that a man must be a collier to qualify himself ?—He will be better qualified if he is.

22176. You think an inspector should be drawn from that class ?—In my opinion it would be advantageous in the view of safety.

22177. With reference to general rule 38, Mr. McLaren gave some reasons why the men do not make use of these inspections. He says at Q. 2604 : " Do those accidents not appeal to the men ? Do they not think they can do anything, by having their own inspection, so as to render those accidents less frequent ? (A). I think inspection by the workmen would have a good effect in that way, as it might help to keep things up to the mark. (Q). Apparently they do not think so themselves in your district ? (A). I do not know what they think, but as a matter of fact they do not make any inspection under general rule 38. (Q). You think they do not make any inspection because they seem to think the work is too hard ? (A). Well, I have spoken to several men, and they said they would not take £1 a day and do the work that one has to do in making an inspection—they have to crawl through the roadways and airways. (Q). Do you think any arrangement could be arrived at by which the men should be paid something in addition to their ordinary pay, so as to induce them to undertake work of that kind ? (A). I think if the Miners' Union would take the matter up and get it done systematically, and pay the men well, they would do it." Do you agree with that view ?—Not wholly.

22178. To some extent ?—I do not think the hardness of the work is what prevents the inspection being done at the instigation of the miners.

22179. You do not think it is not being properly renumerated prevents their doing it ?—No ; the renumeration has nothing to do with it.

22180. You think it is the risk of reprisals ?—Yes.

22181. Have you any reasonable ground for that ?—Only this, that when we have tried to put it in operation we could not get the men to undertake the duties simply from the fear that if they gave a correct report of their inspection perhaps the after-effects would not be pleasant.

22182. You have never had any experience that that was so ?—No ; but that is the reason the men give that they will not do it.

22183. What examination do you suggest the firemen should pass to obtain a certificate ?—I think they should be able to satisfy the examiners in a general way that they are capable of making an inspection of a mine.

22184. Do you suggest that the Home Office should conduct the examination ?—Someone at the instance of the Home office.

22185. I mean you suggest it should be a Home Office examination ?—Yes.

22186. You are on the Examination Board for your district ?—Yes.

22187. Do you think the examination for the second-class certificate would be sufficient ?—I should think it would.

22188. That if a man had a second-class certificate he should be qualified to act as a fireman ?—Yes.

22189. You think the districts are too large. Is that general, or is it only exceptional ?—It is general. The district apportioned to a fireman in our mines, that he has to go over in the morning, is so large that he has not time to do it and to make an examination of the sides and roadways and general safety of the place.

22190. That you have been aware of for some time ?—Yes.

22191. Have you made any representation to the inspector as to that ?—No ; we have been continually urging in that direction, that the inspection was not as it should be.

22192. You have not made any representation to the inspector ?—No.

22193. Have you made any representation to the manager of the mine ?—We never have an opportunity of approaching the management in that way. I do not think the managers would consider we had a right to approach them on that subject.

22194. You have a right to approach the inspector, at any rate ?—I understand we have been approaching someone in higher authority : we have been approaching the House of Commons, year in and year out, in that direction.

22195. But the person who is answerable is the inspector. You look to the inspector as a safeguard, to some extent ?—Yes. Then the inspectors come to the pit-head and see that the report is correct.

22196. You have never made any representation that the district is too large ?—I have not.

22197. Have you made any representation as to the qualifications of a fireman, and that you think the fireman are not properly qualified ?—No.

22198. What reason have you for thinking they are not properly qualified ?—They are not drawn from the ranks of the best workmen as a rule.

22199. Is that the only reason you have for supposing they are not properly qualified ?—From my own observation I have known they are not properly qualified. I have known men act as firemen who had no experience of working at the face at all.

22200. Acting as firemen ?—The district I am speaking of is a non-fiery district, and I am speaking more with regard to the roofs and sides and working faces—not for gas.

22201. These are exceptional cases in which you think the men are not competent ?—As a rule they are not competent for that work.

22202. As a rule the firemen, you think, are not competent to examine for the roof and sides ?—Yes.

22203. You think the firemen should not be dismissed except subject to the approval of the Home Office ?—Yes.

22204. The manager is responsible for appointing competent persons ?—Yes.

22205. If you take that responsibility from him and place it in the Home Office, would you relieve him from the responsibility of their default ?—No, they would still be in his employment.

22206. Although you deprive him of his right to send away a man who was not competent, you would make him responsible for the misdoings of a man he could not select ?—He is to have the selection, but he is to select from those men who have the qualification.

22207. Would the certificate be a sufficient qualification ?—The certificate is to certify that that man has passed an examination qualifying him to be a fireman.

22208. You want to take away from the employer a part of that right ; you want to say: " You may appoint a man, but you cannot dismiss him " ?—Yes. I want to take away that power.

22209. Still you leave the manager responsible ?—Yes.

22210. If he thought the fireman was not competent, you would still make him responsible if he neglected his duty, although you deprive him of the right to discharge an incompetent man ?—When he became aware that he was not competent he would apply to the proper authority to dismiss him.

22211. In the interim has he to be responsible to the manager if anything happens through his incompetence or neglect ?—If it was of such a glaring nature, then he would have to get a substitute and suspend the man for the time being.

Digitized by Google

22212. You think that is an easy thing to do?—That is done in the case of municipalities at the present time with regard to medical officers and sanitary inspectors.

22213. You do not suggest there is any analogy between the danger to lives in pits and a sanitary inspector doing his duty?—Oh yes, there is a great danger of an outbreak of disease in such cases.

22214. But you really suggest there is any analogy between the two?—I think if a man is responsible for making an examination he should be in such a position that he can give a fair and honest report of what has come under his notice when he makes his examination; and he should not be removed from his position for giving that report unless it is an offence which can be taken as justifying his dismissal.

22215. If you are going to take from the manager the right to appoint a competent man, or discharge a competent man, is it fair to still leave upon him the responsibility for anything that the man may do which is wrong?—Yes.

22216-17. You really think it is fair?—Yes.

22218. As to the timbering, the best man is the collier, because he is there and he can see every minute the condition of the roof and sides in his place, and put up the timber if necessary; but you think he is apt to neglect that, because he wants to spend all the time he has got in getting his coal, and therefore, in order to guard against any mischief happening to him because he has not put up the timber, you transfer that responsibility to the manager to put the timbering up?—My view is that the miner ought to be the best party to know when timber is required and to put it up; but I would not relieve him of that duty altogether while a man was being appointed to supervise a section, and to see to the putting up of the timber—I think that the miner in the interests of his own safety would not work where he saw danger, and there would be another precaution in having a man to see that what he had neglected was done.

22219. Your view is this, that the putting up of the timber, whilst it should be done by the collier, should be more carefully supervised and scrutinised by the officials?—I would rather have it that a man was told off to see that a certain district was properly timbered.

22220. Your view is that although the collier should be answerable for the safety of his place there should be more supervision to see that he did what was necessary to keep the place safe?—When I say a man set apart to see it is done, I mean set apart to do it. A man should be appointed to do the timbering, and over and above that the miner, in the interests of his own safety, would do, in that man's absence, what he thought was required.

22221. At the present time the collier has to do the whole of the timbering?—Yes.

22222. That is included in his tonnage price?—Yes.

22223. Would you consider it right that if that work is taken from him and his time put at his disposal to get coal, a reduction should be made in his wages?—We will leave the coalowners to see to that.

22224. Do you say that should follow?—We are always very reasonable in this country, and wherever any rearrangement of the work takes place we try to discuss matters and come to a fair agreement.

22225. The reason for the change, I understand, is because the collier might be anxious to get as much coal as he could, and be disposed to neglect the necessary precautions for his safety?—Yes.

22226. You suggest that piecework should be abolished and the miners paid by the day or the week?—Yes.

22227. Would there be any security then for the miner getting a full quantity of coal?—I do not see any reason why the miner should object, any more than the men engaged in the mine, to work by the day and the week.

22228. Do not forget there are good and bad colliers?—Yes, the same as with respect to every other class of workman.

22229. When a man is paid by the ton it is to his interest to get as much coal as he can?—Yes.

22230. And it is to the interest of the employer?—Yes.

22231. You take away that inducement to a man to get a full quantity of coal?—I am prepared to admit that in the interests of safety if a man is paid by the day, instead of being paid by the ton or by the piece, the output sometimes may be a little less, but still I see where it would be a gain.

22232. But the output being less would be at the cost of the employer, because it would be his loss and not the workmen's loss?—It all depends upon the wages fixed.

22233. If the output of the pit is not maintained it cannot pay?—Quite so; but I can quite conceive where the output would be as great at the end of a period of time. For instance, if that mode of working prevented a man getting a broken leg, then he would not be absent in consequence of an accident, and the output would be as great at the end of the year because there would not be that delay.

22234. You think the output would be considerably reduced?—I do not think "considerably reduced," but it might be reduced.

22235. You suggest with reference to engine-winders that there should be two men at each engine?—During the time the men are being lowered.

22236. Do you think there might be a danger arising from the two men talking and neglecting their duty?—I do not think there would be so much danger from that as what may arise from the present system.

22237. What is the danger you want to guard against? Is it because a man may faint, or suddenly become incapacitated?—Yes.

22238. Does that often happen?—I cannot say it does, but the possibility is there, and so many men's lives being at stake, it directs our attention to what is likely to happen.

22239. This system has been going on for many years; and have you ever known an accident of that sort occurring? Remember that thousands and millions of men are taken up and down the shafts every year almost without an accident. Are you justified in anticipating that such an accident is likely to happen?—It is in anticipation that we want to direct attention to it. It is too late to wait until an accident occurs, and it is better to have a prevention than a cure.

22240. (*Mr. Enoch Edwards.*) What have the men who are appointed firemen been usually employed at previously?—Some may have been engaged working on the roadways as roadsmen, and sometimes they just come up from being pony-drivers and working in the employers' time until being capable, in the employers' opinion, of being a fireman.

22241. Is that the class they are drawn from chiefly?—Yes.

22242. It is rather a revelation to those who come from England, to be told that the firemen are almost exclusively taken from men who have not had practical experience of working at the face?—We call them firemen in our district, or inspectors. It is a non-fiery district, and their principal work is to inspect the roadways and faces before the men go to work in the morning. I think the strongest reason I can give that they are not drawn from the best class of men is that they are not paid as high a rate of wages as the other men who work at the face.

22243. The duty of the fireman is to see to the ventilation and to examine the working places?—Yes.

22244. You say that you think this class of men are invariably appointed from men who have had no experience at the coal face?—Invariably.

22245. Have you had much experience of men being fined for breaches of Rules?—Now and again I have complained of a part of a man's wages being stopped for something for which he has been blamed for doing in the pit; and of course if he submits to that then there is no prosecution.

22246. Have you been able to trace and find out in many cases whether there was any justification for those fines?—We have had cases where the men could prove they were not at fault, and we have asked that the money should be refunded where no prosecution has taken place. Sometimes I have found the manager was acting in good faith, but the information he got was wrong.

22247. That is to say the information is conveyed to the manager by some other official in the pit?—Yes.

22248. And whilst the other official reports the breach of a rule, the manager has the power to inflict a fine and decide the amount of the fine?—When a man goes for his wages he is told that so much is deducted for the offence, and then he can take what action he likes.

22249. You, in your Union, think that discipline is necessary?—I never miss an opportunity of insisting upon the Rules being observed by our men.

Digitized by Google

Mr. Robert Brown.

12 June 1907

22250. You do not think the method of enforcing discipline by fining the men is the best?—I do not think it is the proper remedy to prevent a similar occurrence.

22251. What would you do?—Whenever the manager fines a man at fault for a breach of a rule, let him be prosecuted in the Court, so that both sides can be heard.

22252. You suggest that practical men should be engaged for propping and timbering the roof. You mean by that men over the colliers getting the coal?—Yes.

22253. Have you heard that is largely the rule in the North of England?—I have heard that system prevails in some parts of England.

22254. And you say you would abolish piece-work and pay men by the day?—Yes.

22255. Have you yourself, or any members of your Federation, had any experience of the number of accidents where men were engaged by the day?—My experience—and I have been dealing with claims for compensation since the Compensation Act was introduced in 1897—is that we have a lower percentage of men paid by the day injured, in proportion to those engaged, than those working at the face.

22256. Much would depend upon the nature of his occupation?—Yes.

22257. Timbering roadways in done by day wage?—Yes.

22258. Are there not a great number of accidents in roadways through timbering?—Not in our districts.

22259. The returns would show it. All that is done by day wage?—Yes. We find that 68 per cent. of the accidents in our district take place at the working face by the falls of roof and sides.

22260. This is a phase of the question which has not come before the Commission hitherto, and I should like to put it to you. When you express that opinion does that convey the desire of the Scottish miners?—It has been before our district for a number of years, and I held that opinion years before I left working the coal myself. I have put it forward at our mass meetings time after time, and the men seem to approve and think it would be much better to be paid by the day or the week.

22261. You think that the men contracting in the pit would accept the position of day wage rather than work by contract?—Some men will object, but I think it is a general opinion that it would be much better. It is like everything else, that some men do not know what is to their advantage sometimes.

22262. Of course wages are much higher by contract sometimes?—As a rule.

22263. If we were arguing elsewhere we should say they were much higher?—Yes.

22264. It is rather new to be suggested here upon this Commission for the first time that the men are consenting parties and willing to work by day wage rather than by contract. The other aspect of it, whether some of them—especially those engaged outside getting coal—would want to put up the timber, is another matter; that is to say, the men work by contract, but the company undertake to do the timbering, as they do in the North of England?—I may say, with regard to the amount of money earned, it is generally understood in our district that while miners are engaged at so much per ton, and may make more sometimes than a man paid by the day, at the end of the year the man working under the company and paid in that way is earning the most money by the steady employment he has, and he is not subject to the fluctuations of want of work and such things.

22265. He is not engaged in getting coal?—I mean those getting coal. A man may make a greater wage to-day getting coal, and he cannot get work to-morrow. It is generally understood that a man engaged at a regular day wage paid by the company has more money at the end of the year than a man engaged on piece-work.

22266. He is working more time?—Yes, and steadier.

22267. He is found employment when the other is not?—Yes. The miner would have his day wage when he is in the mine the whole time, but now it happens that sometimes they are in the mine a whole day and only get half a day's work on piece-work.

22268. With reference to the certificates for firemen, of course, now the collieries are managed by the manager, the under-manager, the fireman, and so on, and the manager has a certificate and the fireman has not. You suggest the fireman should have a certificate to show he is competent to do the work?—Yes

22269. You prefer, whether he is a manager or otherwise, that he should have had some practical experience before he gets that certificate?—Yes.

22270. In making your computation about the increased number of inspectors, had you in your mind the Federation's Mines Regulation Bill?—I have had the Bill in my mind, but I think 10,000 is too big a number under certain circumstances for a man to undertake.

22271. If more districts are created, the present inspectors will be able to give more time to inspection and not have so much travelling?—Yes.

22272. You think it would be an advantage if there were more inspectors' districts created?—If there were more inspectors appointed, then, of course, they would be situate in the areas suitable, and they would have a shorter travelling distance to get to the mines.

22273. Is it necessary, do you think, that the assistant inspectors should undergo the same examination for their position as the present inspectors do?—Are you speaking of general inspectors?

22274. General inspectors.—I think they should have the same examination to pass.

22275. You do not favour the suggestion that there should be another class of inspector created, or of a more practical type, who could be in the colliery and get round the colliery?—I understand our inspectors are drawn largely at the present time from the ranks of the employés with a first-class certificate. If they had had so many years' real practical experience at the working face it would quality them still better for that duty.

22276. For any increase in the number of inspectors you would require the same high standard of examination?—Well, there might be grades—first, second, and third.

22277. Whatever practical knowledge he may have, you agree he should have a thorough theoretical knowledge?—Certainly.

22278. It has been suggested by many witnesses that there should be created a class of assistant inspectors at a lessened salary, to get round these collieries. You do not suggest that?—No.

22279. (*Mr. F. L. Davis.*) Your suggestion of abolishing piece work and paying day wage would entail curtailing the coal-getter's earnings, would it not?—Not to the same extent as it would have done some years ago. My experience is that there are more men being employed by the day than ever there were before. The introduction of coal-cutting machinery and contracting is prevailing to such a large extent that there are more men paid by day than there used to be a few years ago.

22280. Mr. Edwards put it that it is a new suggestion to the Commission, and it is surprising to me, judging from our part of the country; do you suggest that colliers, men working at the face, would earn as much, generally speaking, at day work as piece work?—It would depend upon what they had per piece or per day.

22281. I am talking about things as they are at the present time?—Some may earn more and some less. It works out as an average.

22282. You are proposing to penalise the good workman. The man who works well by piece work is to be penalised for the sake of his fellow-men who are not such good workmen?—It is in the interest of safety I make the suggestion. I hold, in all practical work, if miners were paid by the day there would be fewer acoidents. I must admit I have run a risk because I was on piece work, to get my quantity out, which I would not have run if I had known my day's wage was right at the end of it.

22283. I agree with you, that putting men on day wage instead of piece work would do more for safety than any legislation. I am inclined to agree, because a great many of the collieries would be shut up and there would not be half as many accidents as at the present time?—I do not dispute anything of that nature. It is well known what a man can produce in any seam. He is set what he is capable of doing, and I am sure the managers will look after those in their employ to see that they are looked after as well as possible.

22284. Before you settle a price list on a new seam, is it the custom to work on day work?—It has been done in some instances.

22285. Is there not a great difference in the earnings of the men once the price is fixed and it is piece work, compared with day work?—Not much, in my experience. In a new mine it is different. There may be some inducement

Digitized by Google

to take care that the best conditions are made when they come to piece-work. If a system was adopted to be paid by the day, there would be no inducement to hang anything up.

22286. (*Dr. Haldane.*) Your contention was that the employment is more regular with a day wage than piece-work ?—Yes.

22287. Although the wage per shift is less, yet the total earnings will balance in the year ?—We look upon shift men as being the best paid men at the end of the time. They have steady employment.

22288. Your day's wage men ?—Yes ; we call it paid on shift in our district.

22289. (*Mr. F. L. Davis.*) Do you suggest that the work in your district is not regular ? It must be so if you put it in that way. You do not get full work ?—Many things happen during the day to prevent the miner getting full work.

22290. There are some districts I know where work is not so regular as others. Take a district where the work is regular ; then your point does not apply ?—It would not apply where a man is getting full work. I admit by piece he earns more money as a rule, while others, again, working by the piece, those below the average, do not earn as much as those paid by the day.

22291. I am much impressed by your evidence here with regard to the working men's inspection under Rule 38, and the firemen, that the men are afraid to do the workmen's inspection under Rule 38 because of their employers, and that the firemen are afraid to give a true report. Do you consider that the Scotchman is a more nervous gentleman than the Englishman ?—It is owing to the lack of nervousness. They are so cautious they will not run the risk.

22292. It strikes me that you are giving a bad character to your own countrymen. A man is paid wages for doing certain work, and yet he is afraid to do his duty ?—I say they are afraid to do their duty.

22293. Is there any other thing he is afraid of besides inspection and making a true report ?—I do not think he is afraid of the work. He is afraid of the result if he gave a correct report and threw the pit idle for a few days.

22294. I suppose it is the case if a mine manager appoints an incapable fireman, and this man is afraid to do his duty, still the manager is responsible ?—He is responsible.

22295. It is hardly reasonable for people to expect a manager will appoint incompetent men and afraid to do their duty, because he remains responsible all the time ?—Various things can be done for which a manager is responsible and it never comes to be investigated, and the men are suffering all the time. I have known men working with the ventilation such as they should not have worked in. If a report had been made of it the pit would have been idle. If the man had reported it he might not make another inspection.

22296. My experience is that the manager would be only too glad to know, so that he should not take undue risks. You have never known of a Scotchman being too nervous to take his wage in case the money was bad ?—No.

(*Mr. F. L. Davis.*) It is surprising, the fear of these men to do their duty. We have not heard of it from any other district.

22297. (*Mr. Smillie.*) You will hear it from South Wales before we have finished ?—I was at an enquiry in Wales about two years ago, where a fireman was in the witness-box who could not sign his name, and had to admit that the manager had to sign his report given verbally by him. An explosion had taken place, and the manager employed that man.

22298. (*Dr. Haldane.*) You spoke just now of the ventilation being bad in some mines and not put right. What was in the air, firedamp or black damp ?—The want of pure air. It was workable ; your light would still burn, but the miner knew it was not proper to be there.

22299. He felt something wrong with the air ?—Yes.

22300. Do you suppose that was black damp ?—Yes.

22301. It was not the heating of the coal, or anything of that sort, which is worse ?—No.

22302. Do you think that is a fairly common thing in districts you are acquainted with, having too much black damp in the air ?—Yes, and I have seen several complaints as to the want of fresh air to clear away powder smoke. They blast with ordinary powder in our districts, and the men complain they are working continuously in the powder smoke, and can hardly see what they are doing.

22303. You think the firemen often do not do their duty in reporting that ?—I do not think they do.

22304. Are you aware there is no very definite standard with regard to ventilation except with respect to firedamp in the air ?—Yes.

22305. You are of opinion that there are many other things besides fire damp to consider in the air ?—Yes. We have what we call white damp. The lamps burns very well, and the miners term it "white damp," while it is killing you all the time.

22306. Is that always associated with heating of the coal ?—Yes, and where there is a lot of blasting going on.

22307. You call that "white damp" too ?—It is called by some oxide.

22308. Yes, it is exactly the same thing, carbon monoxide. You have seen many cases of that ?—I have worked in it myself. We were driving a stone drift and our lamps burned, and we were unaware that it was going for us, and when we came to the fresh air we fell.

22309. You fell when you got to the fresh air. That is characteristic of carbon monoxide. I am not sure whether you were asked about provisions for changing clothes and washing ?—I did not make any suggestion in that way.

22310. Have you considered the question of the desirability of providing means for changing pit clothes and washing at the pit-head ?—I think that it would be a very good provision if that could be accomplished.

22311. You are clearly of opinion that it is desirable ?—Yes, it would be a great improvement to the homes of the miners.

22312. Have you ever seen that system carried out in any mines you have visited ?—The only place I saw it was in the States. We practised it to a small extent in a little pit I was in.

22313. That was a coal pit ?—Yes. It was not so much a custom established as that the working was wet. It would enable us to get changed before going into the cold.

22314. Are you aware it is the practice in the metalliferous mines in this country to provide a place for washing and leaving the pit clothes to dry ?—Yes. If I may state this, that matter was stated when we met our employers at the Conciliation Board in dealing with ankylostomiasis, and I think the chairman gave his opinion that he was favourable to some such system being adopted.

22315. No colliery has started it yet ?—I am not aware of it ; it may be with a few individuals. They may shift at the pit-head. That is all.

22316. Are you of opinion when the workings are dry that it is desirable to leave the dirty clothes and not bring them home ?—It would be a splendid institution if we had it.

22317. Do you suppose that the miners would be willing to pay something towards the cost if it was established ?—Our men are not against contributing to anything of that nature where we see the benefits. We have been discussing where the men have agreed to pay a penny a fortnight for an infirmary, which doubled the contribution from what it used to be, but knowing it was beneficial they did not mind. They are not against doing a thing when it is properly put before them. Scotchmen are not very bad when things are put before them.

22318. You have had no experience of foreigners ?—Yes, we have a number near here at Newbattle Colliery.

22319. Poles ?—Yes.

22320. They have come here ?—I believe there will be 150 or 200 Poles employed in the Lothian Coal Company's works.

22321. How did they come here ?—One or two got located there and they seemed to call for the others to come.

22322. Have you seen much of them personally ? Do you know many of them ?—I have had some experience through a number of them being injured, and, for their numbers, more get injured than our own people.

22323. Do you attribute that to their not knowing the language ?—Either that or not being practical miners when they are engaged.

22324. Being unskilled ?—Yes. My opinion is that some are very good workmen, those who have been miners before, but there are a number who have not been in a mine until they came here.

22325. Apart from their knowledge of the work, do you think they are fairly respectable men on the whole ?—We

Digitized by Google

Mr. Robert Brown.
12 June 1907

have two classes. There seems to be one class a little more respectable than the others, but there are a number of rows at Newton Grange, and a number taken to Court for fighting and brawling. They seem to have a great regard for Scotch after they come here.

22326. (*Mr. F. L. Davis.*) Do they brawl amongst themselves?—Mostly amongst themselves.

22327. (*Dr. Haldane.*) There is no disagreement with the miners or anybody else here?—Very little. They keep mostly amongst themselves. If they quarrel they usually take weapons to settle the difference, and that makes it worse.

22328. Do they all learn to speak English before they are here very long?—No, unfortunately I have had 10 or 12 deputations at our offices within the last two months, and only once one of the men could make me aware of what he wanted. I have to give them a letter to the delegate who knows what they are talking about.

22329. (*Mr. Ratcliffe Ellis.*) They are not much use, then, on a deputation?—They come and do their best, but they cannot make one understand what they want.

22330. (*Dr. Haldane.*) Supposing a fireman told them anything underground, they would often not understand?—No. I will give you a case that happened at New battle Colliery, where we had a Scotchman living at Dalkeith who was accompanied by one of the workmen to repair a road, and a fall took place and covered up the Scotchman. This foreigner ran off and passed two or three squads of men and they did not understand what was wrong, and this man was lying there for 2½ hours before they could get relief. He would have been better with a dog beside him.

22331. Are you of opinion it is a danger to employ men like that?—I think it is.

22332. (*Mr. Smillie.*) In what way is the manager held responsible for the misdeeds of the fireman? It has been said that the manager is held responsible for the misdeeds or mistakes of firemen, and I think you agreed that was so. I want to know where a manager was held responsible for the wrong-doing of a fireman he has appointed?—I understand that the fireman, being employed under the Statute, the manager may be responsible for damages at Common Law or under the Employers' Liability Act.

22333. That is what you meant?—Yes.

(*Mr. Ratcliffe Ellis.*) I mean this: under Section 50 of the Act, and there is a similar provision with regard to the Special Rules, the owner, agent or manager are responsible for every contravention of the rule by anybody, and can only relieve themselves by showing that they have to the best of their power used reasonable means to enforce the regulations. If it is shown that they have appointed an incompetent person they would not be relieved of their responsibility.

22334. (*Mr. Smillie.*) Supposing a fireman gets a hint from a manager—that is common in Scotland—that he is not to mark in the book anything that is wrong at the coal face and anything takes place as the result of his wrong-doing, is not the fireman prosecuted for that?—In that case it is the fireman.

22335. Would not the manager bring the Report Book to the Court if he was charged, and prove that it was the fireman who had signed the Report Book "Correct"?—Yes.

22336. (*Mr. Ratcliffe Ellis.*) Do you know any manager whom you think would do that, give a hint to the fireman to make an incorrect report and let the fireman be summoned and the manager escape at the expense of the fireman?—I have not known anyone so foolish as to let that be known.

22337. (*Mr. Smillie.*) As a matter of fact firemen are charged again and again with breaches of the Coal Mines Regulation Act?—Yes, sometimes at the instigation of the inspector of mines.

22338. The manager is not charged at all?—No.

22339. Mr. Ellis put it, did you know any case in which an engine-winder was suddenly taken ill, and you said no. Have you read Mr. McLaren's evidence at *Q.* 3325?—No.

22340. Have you known of cases of enginemen dying suddenly? He says: "I have known two cases in my district where that happened: they were small engines at a winding shaft. If that takes place at a small engine it might take place in a large engine?—That is possible.

22341. That is at least two cases in your district where that has taken place. You were asked whether or not you knew that there was a large number of your firemen whose districts were too large, and you said a considerable number of them were. Are you aware that Mr. McLaren at *Q.* 3388 was asked: "You say in your opinion there are too few firemen or deputies to undertake the work at the present time which you think they should undertake?" and his answer was:—(*A.*) "Yes, I think the duties are too large and the appointments too few"?—Yes.

22342 And in the second place that there is a necessity for an increased number of firemen being appointed? The Polish workmen in your district come from the West of Scotland generally?—I could not say where they come from.

22343. The reason I am putting this, it will be apparent to you, is that it has been stated repeatedly that Poles come from Russia and Poland, and that 95 per cent. or 96 per cent. of them have not been miners, and have never seen a mine till they come here. You stated in answer to Mr. Davis or Dr. Haldane that these who are experienced miners are very good workmen?—Yes.

22344. Do you mean those who have got their experience in Scotland and then come to your district, or before the came to Scotland at all?—I am dealing with those whom our men tell me are miners before they reach our district I do not know where they get their experience, but I understood that they had been miners before they left their own country.

22345. You are not aware that in the country from which the majority, nearly the whole of them, come, there is no mining at all?—I know that.

22346. Many of those men you speak of as being good miners may have come from the West of Scotland to your district?—It is quite possible.

22347. Do you think there is a large proportion of them charged with offences before the Sheriff?—There has been a number of cases from Newton Grange taken to Edinburgh and charged before the Sheriff.

22348. I do not mean ordinary offences?—No. My information is that there is not a very large number of these men working at the coal face; I mean only of those who are. A large number are employed by others. Contractors will take them on to lift the debris after it is taken down. They are working with a shovel more than with anything else.

22349. They do not interfere with the native here unless interfered with?—They seem to keep to themselves very much.

22350. (*Chairman.*) You say the firemen are not as a rule drawn from the best men, and you suggest that they should be paid higher wages to begin with?—I would not say from the best workmen.

22351. You need not be a good workman to be a good fireman?—I wish to put it that they are not drawn from the best practical workmen who have experience of the work.

22352. You also mean they are not the best persons to attend to such duties as a fireman has to?—I think not.

22353. Do you suggest that they should be paid higher wages?—If they were drawn from the better source they would command a higher wage.

22354. If bound to be certificated would they command a higher wage then, do you think?—I think so.

22355. I suppose it would be more difficult for a manager, if he dismissed a fireman because he gave what he chose to call an incorrect report which was not in point of fact incorrect, to dismiss a man if he was a certificated man in a certain position than an ordinary workman?—Yes, and I think if the Home Office held a veto against the fireman's dismissal we should be insured upon having a true report.

22356. That it should be illegal to dismiss him?—That they could not dismiss the fireman without giving good cause.

22357. That a fireman should be able to appeal against any dismissal, and that the manager would have to appear in court, if necessary, to justify his dismissal?—Yes.

22358. That is your theory?—Yes.

22359. That ought not to be the case with any ordinary workman. He should be able to dismiss him at his will and pleasure just as a workman could dismiss himself?—Yes.

22360. You think, as regards the fireman, that it ought to be one-sided, that a fireman ought to be able to say "I shall go whenever I choose, at a week, or at the ordinary notice," but the management, as long as they kept him

Digitized by Google

in his position of fireman, ought not to be allowed to send him away. Supposing they want to send him away, they cannot do so. You mean to say that a fireman, once appointed a fireman, could not be dismissed from his position of fireman. He could not be relegated to a hewer again?—I think he should have a right of appeal. He has a responsible position to see to the safety of the men, and in performing his duties he can give offence to the managers, and if he thought it would reduce the output he might not do so. I want him to be in the same position as a sanitary inspector, and where he gives offence the Local Government Board holds a veto there.

22361. I do not mean that a manager should not be allowed to dismiss, but should not put him to any other work, for instance, send him back to be a hewer. For instance, he could not say, "I know some other man who ought to be made a fireman, I will not dismiss you, but send you back again to be a hewer." Could he not do that?—I think that would open the door to the same system which prevails now.

22362. Because when he was a hewer he might be dismissed as an ordinary hewer?—I think once a man holds a certificate to be a fireman and gets a situation from a manager, that manager ought not to have the power to dismiss him without the consent of some other power.

22363. Not only no power to dismiss, but no power to change his occupation?—No, that would be the same as dismissal, in my opinion.

22364. (*Mr. Ratcliffe Ellis.*) Would you suggest that the fireman should dismiss the manager?—No, I would not put anything so ridiculous before anybody.

22365. (*Dr. Haldane.*) You want to put the fireman in the same position as a medical officer of health, who has a right of appeal to the Local Government Board?—Yes.

22366. (*Mr. Ratcliffe Ellis.*) Is not that where they pay a part of his expenses?—They pay a small part of his fee.

22367. Would you suggest that the Home Office should pay a part of the firemen's expenses?—I would not object to them paying a small amount to get a right of veto.

22368. Would you also require that we should not dismiss the manager?—Whenever the manager commits a fault those who employ him will dismiss him.

(*Mr. Ratcliffe Ellis.*) Those people employ the fireman.

Mr. Robert Brown.

12 June 1907

22369. (*Chairman.*) Mr. Ellis suggests, if he was a certificated man, one mode of dealing with him might be that his certificate might be taken away. That might be a penalty for doing his duty badly. If his duties were not properly performed he might lose his certificate?—I am not thinking about a man being dismissed for not performing his duties properly. My theory is, that they would be dismissed for doing it properly.

22370. Mr Ellis suggests that there might be some safeguard in appointing a man as fireman who was certificated because, if he misbehaved himself, perhaps his certificate might be taken away. You would have a greater hold upon him than an ordinary man?—A case might occur where a man was justified in being removed. I am not against a man being punished for committing an offence.

22371. I was only asking you with regard to the certificate. With regard to the duties of fireman it has been suggested that too many duties are put upon the fireman, and it is desirable that he should only be concerned with matters connected with the health and safety of miners, and should not be permitted to be employed in any way merely affecting the pecuniary working of the mine, that the Manager should not be able to look to his pecuniary interest as regards the working of the mine to see that the man attended properly to the trams or loaded up properly, and that nothing that does not concern directly or indirectly the health and safety of the men should be the duty of the fireman?—The practice in our district is that the fireman makes an inspection in the morning and is engaged part of the day on the roadways doing repairing, and then he will take a run through the faces before the men quit. I want the fireman to make a proper inspection in the morning and look to his district as fireman inspecting the places during the day.

22372. He should not do anything but inspect the places?—I think it would be conducive to safety if tied down to inspecting properly.

22373. Do you consider it would be advisable or not that a fireman should be also a man who supervises the setting of timber, or would you have another man?—Part of that duty might devolve on the fireman. It would depend upon circumstances.

22374. If a fireman was a good timberman there is no reason why he should not be also timberman as well as fireman?—It would also depend upon the extent of the area that he had to cover.

Mr. MICHAEL KELLY, called and examined.

22375. (*Mr. Smillie.*) Are you a practical working miner?—Yes.

22376. How long have you been working in the pits? I should say over 39 years.

22377. Your experience is not confined to Lanarkshire; you have been in other mines besides the Lanarkshire mines?—Yes, I have been in Mid Lothian a short time and in America for a short time, in the coal mines.

22378. You have worked in quite a number of collieries in Lanarkshire?—Yes, and visited a number, not as a workman, but as a representative of the Lanarkshire Miners' Association.

22379. There is no seam worked in Lanarkshire in which you have not been employed or that you do not know, either from visiting or working in it?—I do not think there is. I know of none that I have not seen or worked in.

22380. Are you acquainted with the different kinds of mining, stoop and room, and longwall working?—Yes.

22381. You have worked at both kinds?—Yes, I worked a short time at longwall, but most of my time has been stooping, and in stoop and room.

22382. You have worked in seams of varied thickness?—Yes.

22383. From the thickest of our seams, 7 or 8 ft. thick. down to the thin seams?—Yes.

22384. So that it may be taken you have a thorough experience of mining?—I think so.

22385. I suppose your experience has given you a knowledge of what the duties of the various officials, the firemen, the roadsmen, the manager and others, are about the mines?—Yes.

22386. Are you a member of the Executive Committee of the Lanarkshire Miners Union?—I am.

Mr. Michael Kelly.

22387. And have been for a considerable number of years?—Yes, for about 10 years, I should say.

22388. While at the same time you have been a working miner?—Yes.

22389. Do you think that the districts for which firemen are responsible generally in our County at the present time are too large?—Some of them are undoubtedly very very large, too large for a fireman to efficiently do his duties. There are others I have experienced very small, where the fireman can easily do his duties and do them effectively, but a great many districts are undoubtedly very large in which a fireman has practically to run round.

22390. The size of the districts varies?—Yes.

22391. Has it been your experience that the firemen's duties are confined to looking after ventilation and the safety of the men at the face, or have they sometimes other duties to perform?—They have invariably to do that, and also to look after the driver and drawers, and to see that the work in what we call the cleek is carried on.

22392. In addition to their duties of examining the places in the morning and generally looking after the ventilation and safety of the mine at the working face, they almost invariably are expected to look after the pony drivers and the getting of the coals out from the men's faces?—That is so.

22393. That is sometimes considered by the management a very important part of the fireman's work?—Very often.

22394. Firemen are sometimes held responsible for getting the hutches out?—Yes. If the output is short for a day or two the firemen generally gets a wigging as to why more stuff has not been taken out.

Digitized by Google

Mr. Michael Kelly.

12 June 1907

22395. If the output in the section does not come up to the ordinary amount fault is found with the fireman by the overman?—Yes; unless satisfactory reason is given fault is found with them.

22396. Are they very often engaged in laying down roadways?—Yes.

22397. And lifting roads?—Yes.

22398. And redding falls?—Yes; heaps of these things.

22399. Do you think it would tend to greater safety if the time of the fireman was entirely devoted to the ventilation and the propping of the working faces?—Undoubtedly I do.

22400. I suppose you will admit that some accidents, fatal and others, arise from either carelessness on the part of the miners or anxiety to get away their coals?—Anxiety more than carelessness, I should say, and the amount of duties firemen have to perform cause accidents as well. I do not know that I know of an accident occurring through sheer carelessness, but accidents occur in the hurry and excitement of work which requires to be done carefully, and that causes them.

22401. Do you know whether or not the very best class of men are always chosen as firemen, I mean from the practical point of view, and the point of view of thorough knowledge of the duties?—No, I know that they are not. I have known of men filling the position of firemen who had no experience whatever of work in a coal mine. I have known a man come from the surface and before he was three months in the coal pit he got the position of fireman, and he had never previously been down the coal pit.

22402. Was that in what we call a fiery mine, a close lamp mine, or a naked light pit?—I do not remember whether before the explosion which took place at Cadzow Colliery safety lamps were used or not, but that is the colliery I have in mind, and in which a man got employment as a fireman who had been a confectioner by trade and lived where I lived myself. I knew him from a boy, and he got a position in that colliery before he had left his trade as a confectioner three months. Before he had been three months in the coal mine he was a fireman.

22403. Whether or not that was a naked light colliery at that time, it has been a close light colliery for many years?—Yes.

22404. Because of a very serious explosion that took place?—Yes. I do not remember whether this man was a fireman in the colliery previous to the explosion or since.

22405. Has it been your experience that firemen sometimes were appointed not so much because of their competency or qualifications as because of favour on the part of the overman and manager?—There is a great deal of that done.

22406. Are there some collieries in Lanarkshire in which the firemen are very carefully trained by the employer, beginning as pony driver, then roadsman and up to the grade of fireman?—There are some such collieries.

22407. No fault can be found with these men, because they are thoroughly experienced?—Yes.

22408. Although often they have not worked at the face?—Often they have not worked at the face, but they have been through all the grades, what we call shift work, on cost work.

22409. Do you think that it would be an additional precaution in the appointment of a fireman if there was an examination and a certificate of competency?—Undoubtedly. I think a fireman holds a very responsible and onerous position, and that he should be a competent man.

22410. So far as the safety of the mine is concerned, you would consider the fireman at least equal to the manager so far as the responsibility is concerned?—Yes.

22411. Your employment is at present in what is called the fiery district and a close-lamp colliery?—Yes.

22412. Can you tell us from memory how often you have seen the Government Mines Inspector examining collieries?—I never in my lifetime as a miner recollect seeing a mines inspector in the part of the pit where I worked.

22413. You have never seen a mines inspector examining your place as part of the examination of a colliery?—Never.

22414. That applies to your whole 35 years' experience underground?—Thirty-nine. Of course the mines inspector has visited the colliery I have worked in many times, but he has never come to the part of the pit I was working in.

22415. Why do mines inspectors visit collieries?—Invariably after an accident.

22416. If their attention is called to any danger, they at once pay a visit?—Yes.

22417. How long have you worked in the colliery you are at present employed in, Earnock?—I should say 17 years.

22418. Continuously?—Continuously, without a break. I worked some years previous to that.

22419. You have been there 17 years without a break?—Yes.

22420. Have you known of any general inspection taking place in that colliery during that time by the mines inspector?—No.

22421. An inspection may have taken place on a day that you were not there?—That is so.

22422. You might have heard of it, supposing you had not seen one?—Yes.

22423. You have not heard of an inspection taking place?—Not a general inspection. I know an inspector has been there several times.

22424. That is a very well-managed colliery?—A very well-managed colliery, generally speaking.

22425. So far as ventilation and other matters are concerned, it is looked upon as a model colliery, practically?—Yes.

22426. There might not be so much occasion there for mines inspection as there is in other parts of Lanarkshire?—That is so.

22427. The usual method of inspection by the mines inspector, if an accident takes place, is that he goes down to the place at which the accident has taken place, makes enquiries and goes right to the pit bottom again?—That is so.

22428. If mines inspection was properly carried out there would require to be a considerable increase in the number of inspectors?—Yes.

22429. There is a question which none of our witnesses have dealt with yet, and that is the question of shot-firing. Are you aware that there are very strict rules regarding shot-firing in fiery mines?—Yes.

22430. In the Explosives Order and Coal Mines Regulation Act there are very strict rules?—Yes.

22431. It is understood in a close-lamp colliery that there should be sufficient shot-firers appointed for firing shots, specially competent persons. Are you aware that is so?—Yes, I am aware that is so. The rule invariably is that the fireman are told off to do the shot-firing.

22432. He might, of course, be the competent person under the Act?—Yes.

22433. That would be all right?—Yes, in addition to their other duties.

22434. Earnock was a well-managed colliery, you say?—Yes.

22435. May we take it what is applicable to Earnock might reasonably be applied to a worse-managed colliery?—Yes.

22436. It is not worse in any respects, so far as you know?—Certainly not. In a good many respects considerably better.

22437. Is there a very considerable amount of blasting at Earnock?—Yes.

22438. Who stems the shot?

(*Mr. Ratcliffe Ellis*) Are you speaking of the face?

22439. (*Mr. Smillie.*) The face?—The miners.

22440. They bore their own holes and stem their own shots?—Yes.

22441. Who carries the detonator?—The miner is served with it at the lamp station by the fireman in the mornings. He asks "How many shots have you to-day." and he may say one, two, three, or four, as the case may be, and give him as many detonators as he will have shots that day, and he carries them to the face with him.

22442. It is a high explosive that is used there?—Yes.

22443. What is the method of firing shots?—By electricity.

22444. What steps lead to the firing of the shot? The fireman is the shot-firer; what action does he take usually?—As a rule they have stated hours for going round, twice in the day for shot-firing, between 7 and 9, and very

Digitized by Google

probably 12 till 2, and he takes the round of his district; he goes round the faces and shouts in to the miners he is passing "Let me have a shot; are you ready?" Sometimes they go in. Invariably the fireman goes in with his cable and connects his cable with the wire atttached to the detonator, and uncoils his cable and goes round the end of the stoop and puts his battery on the other end of the cable and fires the shot. But instances have occurred where firemen have not done that, but have shouted to the miner at the face to take one end of the cable and attach it to the shot while he was attaching the battery to the other end of the cable, and fatal accidents have occurred because of that. I have known of three fatal accidents occurring in that way, and one permanent injury; the man lost his hand, practically all of his fingers.

22445. In the Earnoch Colliery you remember that?—Yes.

22446. Three fatal accidents, and one man permanently disabled. Is that during the last 10 years?—Yes.

22447. That is one of the best managed collieries in Lanarkshire?—Yes.

22448. You have no idea at the present time what takes place in the worst managed collieries in Lanarkshire; from personal experience you do not know?—No. I have been making enquiries as to the method of shot-firing where safety lamps are in use, and where they are fired by electricity, and it is the same as I have described; the fireman serves out the detonators to the miners in the morning at the lamp station and they carry them to the face.

22449. The fireman is a competent person for shot-firing?—Yes.

22450. Those firemen, in addition to being shot-firers, have the ordinary duties of firemen, ordinary examinations to make, and they have to look after ventilation, and sometimes when they are shot-firing, may they not be called away to look after the hutches?—They are.

22451. They are sometimes called away even when engaged on duties as shot-firers?—That is so.

22452. To do what?—To look after the drivers where something may go wrong on the road. The driver runs to the fireman to get some assistance to put hutches on the rails, and for the time being he has to attend to the output.

22453. Is not the output usually looked upon as the most important thing?—Yes. It is no good carrying on the pit; in fact they will not carry on the pit if the output is going back. The output is the thing to carry on the pit for.

22454. That is the chief thing?—Yes.

22455. As a member of the Executive Committee of the Lanarkshire Miners' Federation you have heard from time to time complaints as to the condition of the mines in various parts of the county?—I have.

22456. Are you aware that some time ago the Lanarkshire miners decided to permit any branch of the Union to appoint examiners under Rule 38 of the Mines Act?—Yes.

22457. And that is now being largely taken advantage of?—There are a considerable number of branches who have taken advantage of it.

22458. Should I be right in saying that it has led to a considerable improvement in the condition of some of the mines?—We have heard so.

22459. You have heard that reported?—Yes.

22460. You have heard that officially reported from the miners' officials at the colliery?—Yes.

22461. There is nothing to prevent the miners at any mine in Lanarkshire appointing inspectors to make the inspection under Rule 38; so far as payment is concerned, that is guaranteed?—Yes, we guarantee the payment.

22462. The report comes to the Executive Committee as to the condition in which the mine is found?—Yes.

22463. Has there been any case in which fault has been found by the inspectors with the condition of the mine?—Yes, several.

22464. And the attention of the mines inspector has been called to those?—That is so.

22465. You do not know at the present time whether immediate attention has been given to them by the inspector?—I have not heard.

(*Chairman.*) How long have they been appointed?

(*Mr. Smillie.*) For the last 12 months almost. It is 12 months since we agreed to this.

22466. Do you remember a threatened strike at Dechmont Colliery?—Yes.

22467. I suppose you know that colliery well?—Yes.

22468. You are aware that it is a close-lamp district?—Yes.

22469. In what is known as the fiery zone of Lanarkshire?—Yes.

22470. Do you remember what the dispute was about?—The dispute was about the introduction of an improved lamp.

22471. An improved safety lamp?—Yes, which would be a great advantage over the lamps previously used in the colliery, both from the point of view of safety, the company alleged, and also a better light for the workmen while at work.

22472. Is it a pretty general thing for the workmen to pay a penny per day for the use of safety lamps at the collieries in Lanarkshire?—Some of them do, and some get free lamps.

22473. It is fairly general that there is a charge made of a penny a day?—Yes.

22474. For the use of lamp, oil and wick?—Yes.

(*Chairman.*) Do they not get the extra 2d. a ton for working with the lamps?

(*Mr. Smillie.*) In a naked light district, if they are forced because of danger to adopt safety lamps, they usually claim a penny per ton for a thick seam 4 or 5 or 6 ft., and 2d. a ton for 2 ft. to 2½ ft., and they almost invariably get it.

(*Mr. Ratcliffe Ellis.*) They have not to buy their candle?

22475. (*Mr. Smillie.*) No; it means about the same thing to the workmen. At Dechmont Colliery, where this strike was threatened, the workmen never have paid anything for the use of their lamps?—No charge whatever has been made.

22476. The employers introduced an improved lamp?—Yes.

22477. The general manager himself said it was an improved lamp?—That is so.

22478. That was proved to the Executive, that it was an improved lamp so far as the safety of the mine was concerned?—The workmen in the colliery admitted that it was.

22479. They admitted it was a better light, at least?—Yes.

22480. Did the employer wish to charge a certain amount per day for the use of that?—Yes.

22481. And the men refused to pay?—Yes.

22482. We were brought to the verge of a stoppage of 300 or 400 men about it?—We were.

22483. Do you remember the negotiation between the officials of the Union and the management, which ultimately prevented the strike, and we prevailed upon the management not to make the charge?—We endeavoured all we could, but we avoided a rupture by withdrawing the improved lamp.

22484. (*Mr. Ratcliffe Ellis.*) He withdrew the lamp and gave the men the old lamp?—Yes, without any charge, as formerly.

22485. (*Mr. Smillie.*) The dispute ultimately came to this, that one farthing per day would have been accepted by the company for the use of the lamp?—He would have taken the smallest fee providing the workmen had agreed to pay.

22486. The workmen declined to pay anything, having paid nothing previously?—Yes.

22487. The safer and better lamp was withdrawn?—Yes.

22488. That colliery is worked now with a lamp less safe than the lamp introduced?—Yes.

22489. In Earnock Colliery there is a considerable amount of mechanical haulage?—Yes.

22490. You do not know whether or not there has been any serious accident arising in connection with haulage?—There was one serious accident with a haulage incline heading. Precautions have been taken since. It was due to the breaking of a coupling. A tram of hutches, about 28 or 30, were going down a steep incline and a coupling

Digitized by Google

Mr. Michael Kelly.

12 June 1907

broke near the end. The chain man stands on the last hutch down the brae, and when the coupling broke there was only one hutch left on the tram then, and it rebounded with such force that it broke his knee and permanently lamed him. Since that accident the company have introduced a safety chain which, in addition to the rope attached to the hutches, is attached to the last hutch and put on underneath the hutch ; it will probably take half of the number of hutches which is running in the tram, so that if a coupling broke in any of the hutches of the safety chain there are sufficient hutches on to prevent a rebound. If a coupling broke further on in the tram where the safety chain was attached, then the brake was in contact, and it was sufficiently strong to hold. No accident has occurred since they introduced the safety chain.

22491. Suppose the safety chain goes the whole length of 28 trams, from the first tram right back to the rope, that would prevent a rebound of the hutches, or the hutches running away in the case of a coupling breaking ?—Yes.

22492. Or a rebound to cause this injury ?—A rebound cannot take place with that safety arrangement, because the weight is sufficiently heavy to prevent it.

22493. Are you aware that a considerable number of accidents have taken place by reason of the breaking of couplings, or draw bars—generally, not in your colliery ?—Yes, generally.

22494. Do you think that it should be made compulsory by Act of Parliament that that wise precaution should be taken ?—It should. I am of opinion that the runaway points should be compulsory. A good many managers have taken that precaution and have runaway points, but others have not taken that precaution. I was called up a fortnight ago to Quarter Sessions in Edinburgh to give evidence in a case of a very serious accident that occurred because of the want of runaway points.

22495. Runaway points would have prevented that accident probably ?—They would have prevented it ; as a matter of fact I was informed that the management has put on the runaway points since the accident occurred.

22496. If they were compulsory they would have had them on before ?—Yes.

22497. I want to deal with a not very savoury point, as to which you are well qualified to give evidence, and that is the condition of the mines in Lanarkshire. Are they kept in a clean sanitary condition ?—No, they are not clean, and there is no keeping of them at all.

22498. Is there any attempt made to keep them in a clean and sanitary condition ?—None whatever.

22499. Am I correct in saying that you have seen in some of the mines, roadways where you could scarcely walk along for filth—human excrement ?—Yes, many times.

22500. For a distance of 20, 30 or 40 yards ?—Yes.

22501. The men use the bye-roads or disused roads for the purpose and no attempt is made to cover up the excrement ?—None whatever. I have known men sick and vomit several times with the stench and smell which was carried in from these things at times. Men have had to go home.

22502. It is not an uncommon thing for the men to be drinking the water which may be passing through those very places sometimes?—Some may do it. It is not common, because a large number of miners now carry water from the surface in pails, but there are many who have travelled a considerable distance from where they live to the colliery where they work who do not do that, and they have to resort to whatever they can get to quench their thirst.

22503. It is not an uncommon thing for some of the collieries to be infested with rats. There are hundreds and thousands of rats in some ?—Collieries are practically infested with rats now. As a matter of fact at the Earnock Colliery they employed a professional rat-catcher for some time to get rid of them.

22504. Do the rats in the pit sometimes give rise to a terrible state of matter which makes it almost impossible for the workmen to pass and re-pass ?—Yes, terrible.

22505. Is that one of the conditions where, if ankylostomiasis broke out, the temperature being favourable, a spread of that disease is bound to be rapid ?—I should fancy so.

22506. As far as you know, there is no colliery in Lanarkshire where there is any attempt made to put any place at the service of the workmen ?—I have never heard of any attempt being made anywhere.

22507. (*Mr. Ratcliffe Ellis.*) You say that you have visited many collieries in Lanarkshire ?—Yes.

22508. In what capacity ?—As a representative of the Lanarkshire miners.

22509. Under Rule 38 ?—No.

22510. In what capacity ?—We have had disputes about rates or drawing conditions between the workmen and the management. In order to thoroughly ascertain the conditions of employment, as to whether claims of our members were just or excessive, our Executive invariably send one or two of their members to visit the colliery in dispute, or the part in dispute, and examine the working conditions and report to the Executive, so that they would be in a better position to decide as to the merits of the men's claims

22511. You do that by permission of the management ?—Yes.

22512. Have you visited Baird's Collieries under Mr. Forgie's management ?—Yes.

22513. Have you ever inspected under Rule 38 ?—I have.

22514. Which colliery ?—Earnock Colliery, some years ago.

22515. That is where you were working yourself ?—Yes.

22516. Have you inspected more than once ?—Only once.

22517. In company with another miner ?—Yes.

22518. One who worked at the pit ?—Yes.

22519. How long did it take to do the work of inspection ? We did it in one day ; it was only one seam.

22520. What time would it take to make the same inspection of every pit ?—I should say it would take two men, if they visited the whole mine, at least a week.

22521. What sort of a report did you make ?—The seam that I and the man who accompanied me visited was the seam I happened to work in at the time, and we reported that we found everything correct. The occasion which led up to this inspection was a breakdown in the fan at the colliery at the time, and there was a rumour spread amongst the workmen that certain parts of the mine were fiery and that they were working under great danger, and this alarmed the men considerably, so that it resulted in a number of men being appointed to inspect the colliery. The colliery was laid idle on a given day to permit of this inspection, just to allay the fears.

22522. You and another man inspected your part, and other men other parts of the colliery ?—Yes.

22523. I suppose nobody could do that better than you men who worked there ?—I am not prepared to admit that.

22524. Could anybody do it better than you ?—I do not know that anybody could do it better, but certainly they could do it as well.

22525. Did you find any reprisals were made by the management for making this inspection ?—No.

22526. The management made no objection ?—No.

22527. You have not found yourself any worse than anybody else ?—No ; as a matter of fact the manager was very pleased that the inspection took place, because he was aware of the fear that the men were working under at the time, and he was also aware that there were no grounds for those fears, so that he was very pleased that this inspection took place.

22528. That inspection really had the effect of satisfying the men that these rumours were unfounded ?—Yes.

22529. With that object do you not think the men would be more satisfied by an inspection by their own members, by somebody working in the pit, than an outsider ?—No, I do not think they would.

22530. Were they satisfied after your inspection ?—They were.

22531. Everybody went to work again ?—Yes.

22532. As far as the result was concerned it could not have been more satisfactory whoever examined it ?—Not upon that occasion ?

22533. Do you think that there is a reasonable ground for a fear that if workmen engaged in a colliery other than the one they inspect, or some other colliery, if they had to make an unfavourable report, that they would suffer for it ?—Yes, there are grounds for fear.

22534. There is fear ?—Yes, and grounds for it.

22535. Have you known anybody who has suffered from making an unfavourable report ?—These are matters you cannot directly prove, because it is so easy to find excuses and reasons for dismissing workmen.

Digitized by Google

22536. With reference to timbering, do you propose that timbering in the working places, which is now the duty of the collier or hewer, should now be transferred to somebody else?—I do.

22537. Do you think there is anybody more competent to do it than the collier himself?—Yes. I do not say that the miner is incompetent and cannot do it; he can do it; but just now that is not what he is paid for. He is paid for getting coal, and he intends putting timber in its place, but it is put off and put off until too late.

22538. I understand that exactly, but the rate he is paid includes the work of timbering?—Yes; in theory that is so.

22539. Although the miner can do it, yet he wants as much time as he can get to get coal, and neglects this work for safety?—Yes.

22540. You want to give him more time for getting coal and put the duty of timbering on somebody else?—Not exactly. If the duty of securing the working places is put on the owners, it would be a matter of readjusting rates.

22541. I understand that. You agree if the timbering was put upon the owners it would be necessary to adjust the field rates?—Yes.

22542. So that the miner, being relieved from that work, would have less field rate?—Precisely so.

22543. You think it would conduce to safety if that change were made?—I am absolutely certain.

22544. The ground of your belief is because the miner is tempted to put off doing it in order to get coal, and it is often too late, and then the mischief comes?—Yes, that is so.

22245. With reference to shot-firing, have you any suggestions to make in addition to the present regulation with reference to shot-firing?—I think the best solution of the shot-firing business would be that everywhere where safety lamps are used shot-firing should only take place during the night time.

22546. Or when the men are not at work?—Yes. At Dixon's Colliery, at Blantyre, since the big explosion about 30 years ago that system of shot-firing has been in operation That is a colliery including four pits. Some of the seams are large seams and no shots are fired while the men are at work, and an accident has never occurred during the last 30 years in that colliery.

22547. Your view is that where lamps are used and not naked lights, the shot-firing should be done between the working shifts?—Yes.

22548. You said, if I understood you aright, that the present practice at your pit is that the detonators are given to the collier?—I do not refer to the colliery where I work. I say that is the general rule.

22549. At the colliery you work what is the rule?—That is the rule.

22550. To give the detonators to the collier?—Yes.

22551. Do you know the regulation in the Explosives Order?—I do.

22552. That detonators shall not be used or taken for purposes of use into any mine unless the following conditions are observed. "Detonators shall be under the control of the owner, agent, or manager of the mine, or some person specially appointed in writing by the owner, agent, or manager for the purpose, and shall be issued only to shot-firers or other persons specially authorised by the owner, agent, or manager in writing." That obligation is not carried out?—According to my reading of it it is not carried out.

22553. Are colliers instructed to fire their own shots? The shots are fired by the firemen?—Yes.

22554. What is the object of giving the detonator to the collier?—To save time. If a miner charges and stems his own shot and has everything ready, the shot-firer, who is invariaby the fireman, has only to run round.

22555. That does not seem to be in accordance with this regulation?—You can take it from me that it is the invariable method.

22556. There is another thing: "Where the charge is fired by an electrical apparatus the shot-firer shall not use a cable for the purpose which is less than 20 yards in length. He shall himself couple up the cable to the charge and shall do so before coupling the cable to the firing apparatus." In the particular case you mention that regulation was not observed?—No.

22557. The fireman who asked the collier in that case to couple up his cable with the shot—did you know that fireman pretty well?—Yes.

22558. How long had he been a fireman?—He had been a fireman for years.

22559. Did you know him before he was a fireman?—No, I do not think I did. He was a fireman when I knew him first.

22560. You do not know what rank he had been drawn from?—No.

22561. (*Mr. Enoch Edwards.*) He was not the confectioner?—No.

22562. (*Mr. Ratcliffe Ellis.*) That fireman, you suppose, was a competent man?—I do not know. I would not put him down as an incompetent man.

22563. He was careless upon that occasion?—I do not know that it was carelessness, either. The man had too much work to do.

22564. Because the man had too much to do was the reason this mishap took place?—Yes.

22565. Can you give me the name of the confectioner who was a fireman afterwards?—I do not remember his Christian name, but Walker was his surname.

22566. How long is it since this took place?—This is long over 20 years ago.

22567. You have not known anything of the sort during the last 20 years?—No, but I heard of a case probably six or seven years ago. I have no knowledge of it. I know of a case of a policeman who became a fireman.

22568. Do you think it would be an advantage if there was a regulation that there should be no shots fired in the haulage roads unless under the immediate direction of the manager?—Very seldom, if ever, are there shots fired in the haulage roads, and when they are it is usually between the shifts.

22569. Whether between the shifts or not, do you think the manager ought to authorise the firing of shots in the haulage roads?—Certainly.

22570. Do you think there should be any further regulation than exists with regard to the stemming of the shot?—I do.

22571. You think they might be detailed a little more?—Yes.

22572. So as to secure that the shot is properly stemmed?—Yes.

22573. Do you think that there should be any further regulation with regard to the drilling?—No, I think that is perfectly safe.

22574. The stemming ought to be more provided for?—Yes.

22575. Can you suggest in what way you think there should be an addition?—I think the authorised shot-firer should be the stemmer—the person to stem the hole—and not the miner.

22576. That is often the case in England, but apparently not the case in this country?—That is the reason they serve them to the miner, so that they may get every thing ready.

22577. With reference to the haulage, you think anything that would conduce to preventing tubs running away, or minimising the mischief when they do run away, would be a very desirable improvement?—Runaway points, in my opinion, are a very necessary precaution to take, and I think mine-owners should be compelled by law to provide some such precaution.

22578. (*Mr. Enoch Edwards.*) What class of men are the firemen generally drawn from, and what are they before they become firemen?—Some of them do a little driving, and some of them get on as roadsmen.

22579. What do you mean by "driving"?—Pony driving—tramming, I believe you call it.

22580. And some of them roadsmen?—Yes.

22581. The policeman you referred to might have belonged to a fire brigade before?—I do not know what he belonged to.

22582. I mean that would be a sort of qualification for a fireman. You do not think there is much of that, after all, in Scotland, where they appoint a man so thoroughly inexperienced?—There is not much of that.

22583. Is the colliery you work at a fairly average well-managed colliery?—It is.

Digitized by Google

Mr. Michael Kelly.

12 June 1907

22584. Would it be correct to say that the firing of these shots in the method they are now fired by the fireman is done with the knowledge of the manager in that colliery?—The method is known to the manager.

22585. The manager knows what is going on?—Yes. Of course a manager would never anticipate that a fireman would ever ask the miner to take one end of the cable and couple it on to his shot. The fireman who was guilty of that was dismissed by him at once.

22586. So that is not done at your colliery?—No. I have only instanced the four accidents that occurred because of that being done.

22587. But not recently?—No. A number of Poles are employed in that colliery, and I was told that the Poles, who were so very very anxious to please the fireman, when they heard him shouting ran out and met him and took one end of the cable. They it was, I believe, who voluntarily did this themselves before ever a fireman thought of allowing a miner to do it.

22588. You do not suggest that they do that sort of thing at your colliery now?—No; but the method lends itself to its being done. It may be done any time because of the present method of the detonators being served to the miners.

22589. So far as you know it is not practised in that form at your colliery?—It is not.

22590. But the method of handing these things to the colliers lends itself to it?—Yes.

22591. I understand the reason why you say that is because the district is too big?—Yes.

22592. You think it could be met by the appointment of an additional fireman?—Yes.

22593. Is this colliery a gassy colliery?—No.

22594. You use lamps?—Yes.

22595. And only permitted explosives?—Permitted explosives.

22596. You have considerable knowledge of other collieries besides where you work. What is your experience as to the scarcity of firemen at these collieries? Are there more collieries where there is a lack of firemen and they cannot do the work?—That is to say an insufficient number. It is a common complaint of firemen that their district is too big and their work is too heavy.

22597. Can you tell us what is the qualification for a fireman?—I do not know that there is any qualification more than a desire to get such a job.

22598. There is no standard set up?—No standard.

22599. So that it is quite open to appoint anyone as fireman?—Yes.

22600. Does the manager appoint them?—I am not aware whether the overman or manager appoints them. I should be inclined to think it would be the manager.

22601. It would be more likely to be the manager?—Yes, but I do not know from my own knowledge.

22602. Would you think that the manager was not carrying out his duty if he appointed someone who was not qualified?—I would, indeed.

22603. The fireman is more in direct touch with all the elements of safety in a pit than anyone else in it?—That is so.

22604. With reference to timbering, I gather you have had long experience in pits in Scotland and elsewhere, and you think that if the company undertook to do the timbering it would lead to greater safety?—Undoubtedly.

22605. Do you think it would be practically possible for a collier, say, you and your mates, to work on a place by contract and the company find men to do the timbering?—Yes.

22606. Is it necessary at times that a prop should be set rather hastily?—That is so.

22607. Would you suggest that in every working place the company should keep a man to set timber?—That would not be necessary.

22608. We are a bit anxious to get the practical side of this, and we want you to tell us how we can do it, if it is a good thing. Are you aware of the methods of timbering in the North of England?—I have been informed that the miners are not asked to do the timbering in the North of England.

22609. The deputies do it?—Yes. As a matter of fact we know a number of North of England miners who come down here cannot do it, and they know nothing at all about it.

22610. But in the absence of the deputy the men ought to timber for themselves?—Yes.

22611. You think that would be practical in Scotland?—Yes. Just now in the bigger seams where stooping is involved, more often than otherwise the timbers at the disposal of the men do not fit, they are too long. The floors and the roofs are gradually getting nearer to each other, and posts that would be of a proper length to-day would probably be three or four inches too long to-morrow. The miners' great difficulty is in failing to get timber the proper length, particularly for the stoop.

22612. Do you work the coal longwall?—No, stoop and room.

22613. You are not confusing spragging coal with timbering?—No. Some of the seams are worked longwall.

22614. And the sprags would have to be set by the men working longwall?—Yes.

22615. What you are referring to is the timbering in the roof?—Yes, in the roof.

22616. (*Chairman.*) Have you a first or second-class certificate?—No certificate whatever.

22617. Have many of your mates in the mine working with you certificates?—Yes, a considerable number of miners now have first and second-class certificates.

22618. (*Mr. Enoch Edwards.*) I suppose you have never sat for one?—I have never sat for one.

22619. (*Dr. Haldane.*) Do you think it would be quite practicable in Scotland for the company to do the timbering? Would there not arise delays in the work from no one being present to set the timber at the right time?—I do not think there would be many delays. As a matter of fact if a miner felt there was a necessity for a prop being put up, and there was not a man to put it up, he would put it up. One of the things I have noticed, in a number of pits in Lanarkshire, is that the overman or manager who generally accompanies him invariably in almost every place they go in have to complain of the miners not having their places properly timbered, and certainly not in accordance with the timbering rules. As a matter of fact, managers cannot afford to enforce the timbering rules, because the men tell them they are not paid for it, the rates are so small, and so on. Only one instance have I noticed where a manager has sent a workman home for want of having his place wooded and spragged because there were no props for him. He told the manager there were no props, and the manager said, "Well you will go home—you have no right to be there, supposing you have no props," and the manager told the overman never to let this occur again; and he told the miner, "Next time I get you in this way I will prosecute you." In all the other cases they warn the men, and the men say, "Well, we are going to put them up, but we have not time just now, we are too busy getting the hutches."

22620. (*Mr. Ratcliffe Ellis.*) If a man's place is not properly timbered, in accordance with the Act of Parliament and the Rules, he is not allowed to stop there?—Quite so.

22621. (*Dr. Haldane.*) With regard to the question of sanitation in Lanarkshire, are the mines you referred to as being dirty also hot or warm?—Some of them are very warm.

22622. Warm so as to make you sweat?—Yes, without working at all some of them make you sweat.

22623. Are any of them wet as well?—Yes, wet and hot.

22624. What district are you referring to now?—I am referring to the Blantyre District and the Burnbank District. There are some of the mines there very hot.

22625. Deep mines, I suppose?—Well, ordinary.

22626. Would they be 500 yards deep?—No, about 200 yards.

22627. And still very hot?—Yes.

22628. How is it they are so hot?—I think it is coming out of the waste workings; some of it is due to steam. The haulage underground is worked by steam, and some of the heat is caused by steam.

22629. Do the steam pipes come down the downcast shaft and warm the air that is going into the mine?—Some of the steam pipes are carried from the bottom along the main intake roads.

22630. (*Mr. F. L. Davis.*) Are the boilers underground or on the surface?—The boilers would be on the surface. It is the steam pipe.

22631. (*Dr. Haldane.*) You think that is one of the main causes of the heat in these shallow mines?—Yes.

Digitized by Google

22632. Generally a shallow mine is not hot?—I know that. One of the causes is that the heat comes out of the mineral somehow when the drift closes and the men are endeavouring to get the coal closed in by the drift—and in some cases the coal is so hot that you can scarcely hold it in your hand.

22633. That is working stoop and room?—Yes.

22634. I quite understand in that way you get mines that are both hot and damp?—Yes.

22635. I think you have worked in America for a time?—Yes, for a short time.

22636. In the mines at which you worked had they any facilities for washing at the surface at the pithead, and changing their clothes?—No.

22637. You have never seen that system carried out?—No; but at all the other works—ironworks and steelworks—in America, they have the means of washing.

22638. Are you of opinion that it would be desirable to have arrangements of that sort at the top of each pit?—Yes, it would be very very desirable, and a great improvement.

22639. You think that the men would be in favour of it?—Yes.

22640. Of course it causes some delay in getting home and there is something against it, perhaps, from that point of view?—Yes, but it has the advantages that you are going clean into your own home, and you are not taking filth with you as you do at present.

22641. You think from that point of view it would be desirable?—Yes, very very desirable. A considerable number of the coal-owners in Lanarkshire have a large number of their workmen housed in their own houses, and the sanitary conditions are very very much below what they are with respect to other property. The sanitary conditions about the miners' homes are very primitive indeed.

22642. You mean there are not proper conveniences?—None—no proper conveniences.

22643. No water-closets, for instance?—No.

22644. Have they just out-of-door arrangements?—Yes, common ashpits.

22645. No proper drains?—No.

22646. Are there means for regularly taking away the stuff from these ash-pits?—Just when the heap gets so large that the structure for holding it is getting congested and sometimes a few weeks elapse before the removal.

22647. That is hardly a matter for this Commission; it would be a question for the Medical Officer of Health?—You see the relation between the two. Where conveniences are so very very bad for the miners at their homes it necessitates much more of that being done in the coal mine than would be done if proper facilities were given.

22648. Is there a good supply of conveniences usually at the pit-head or about the pit-head?—There is not.

22649. That is not the custom?—No; there is usually a large dirt bin, and as a rule the workmen about the pit-top go away out to that dirt bin.

22650. (*Mr. Smillie.*) Are there any females employed at the pit bank at your colliery?—Yes.

22651. What number?—I should say about a dozen.

22652. Are there females employed at other collieries around Earnock and the Hamilton district?—I know there are at Blantyre and Hamilton.

22653. There are hundreds employed altogether within some miles?—Yes, round Bothwell.

22654. Do you know whether there are any conveniences for the women at the pit banks?—There is a little wooden structure at Earnock; I do not know about other collieries.

22655. Do you think that the employment of women at the pit bank is a desirable thing from a moral or physical point of view?—It is not.

22656. (*Chairman.*) Do I understand you to say that to your knowledge throughout Scotland at present it is the custom for the management to issue detonators to workmen?—Not the management; the firemen, who are specially appointed shot-firers, get the detonators after going round their district and examining their district before the workmen descend the pit in the morning. They have a lamp cabin, and they keep the detonators there in a box; and at that lamp station when the fireman is examining each miner's lamp, he asks them how many detonators they want, and each is served with the number he asks for.

22657. The management know that is the practice, I suppose?—Yes.

22658. So that the management allow these firemen to issue detonators to ordinary workmen, and they allow those detonators to be handled by ordinary workmen?—Yes.

22659. That is a contravention of the rule under the Explosives Order, which says "Detonators shall be under the control of the owner, agent, or manager of the mine, or some persons specially appointed in writing by the owner, agent, or manager for the purpose, and shall be issued only to shot-firers or other persons specially authorised by the owner, agent, or manager in writing." The manager would not be justified in allowing him, if he knows about it, to issue a detonator to an ordinary miner?—Not only the manager must know of it, but the mines inspector must know of it in Scotland.

22660. Do you say the mines inspector must know of it?—Yes, he must know it.

22661. It is a strange thing. This order has been in force ten years, and we have not had a single word from a mines inspector telling us that it has been infringed. It seems to me to be a clear infringement. I do not know whether the mines inspectors read the order in this way, that so long as the management give out these detonators to the authorised person, then the authorised person may do what he likes. But I cannot read it in that way. It says "shall be issued only to shot-firers or other persons specially authorised." The manager might say it was issued in accordance with that Order to the fireman, who was the person specially authorised, and what he did with it has nothing to do with him. But I should not think that could be the reading of it. It does not specially say that no one but shot-firers might handle it; but that surely would be the corollary, I should think?—Well, it is done.

22662. The next rule says; "Shot-firers and other authorised persons shall keep all detonators issued to them until about to be used in a securely locked case or box separate from any other explosive"?—That is what the rule says.

22663. (*Mr. Ratcliffe Ellis.*) I understand from you that the fireman hands it over to you when he gives you a lamp?—Yes, in the morning.

22664. That is a long time before the detonator is going to be used?—Yes.

22665-6. (*Chairman.*) It seems to be an extraordinary thing that this Explosive Order should have been in force ten years, that the mines inspectors seem to think it is all right, and that a fireman should be allowed to issue these detonators at the beginning of the work with the lamps?—Well, it is so.

THIRTY-FOURTH DAY.

Thursday, 13th June, 1907.

At Edinburgh.

PRESENT

Lord MONKSWELL (*Chairman*).

F. L. DAVIS, Esq.
ENOCH EDWARDS, Esq., M.P.
THOMAS RATCLIFFE ELLIS, Esq.
JOHN SCOTT HALDANE, Esq., F.R.S.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary.*)

Mr. JOHN WILSON, called and examined.

Mr. John Wilson.
13 June 1907

22668. (*Mr. Smillie.*) Are you a miners' Agent?—Yes.

22669. You are prepared to give evidence to this Commission as representing the Scottish Shale Miners and West Lothian Coal Miners?—That is so, but I give evidence to-day chiefly for the Scottish Shale Miners.

22670. Your practical experience as a miner is confined chiefly to shale mining?—Mostly, although as a young man I have got both coal and iron stone.

22671. You have a considerable amount of shot-firing in the getting of shale?—A great deal.

22672. Far more so than in getting coal?—I should say much more than in the getting of coal.

22673. Are there many accidents arising from shot-firing?—We have several every year.

22674. Do the workmen generally fire their own shots?—That is so.

22675. Are there any shale mines which at the present time are being worked with safety lamps?—Not to my knowledge.

22676. There have been explosions of gas in some of the shale mines?—There have. In some of the districts there are generally one or two every year.

22677. You propose that the rules with regard to shot-firing should be so rearranged that miners should not go back upon a shot which had missfired until the following morning?—We discussed that on Saturday last with the shale miners' officials, and they think that is a wise precaution with respect to shale mines.

22678. I take it the workmen fire their own shots?—That is so.

22679. Do you know whether or not they are fired with detonators or with ordinary strum?—They use strum chiefly.

22680. (*Dr. Haldane.*) What is the present time limit for going back in the case of a misfire shot?—I have examined into it, and it varies from half an hour to forty minutes at the present time.

22681. And still there are accidents sometimes in going back after that time?—That is so. It is dangerous to go back in some cases within half an hour, or even an hour.

22682. (*Mr. Smillie*). In some cases have shots been known to go off after an hour?—We were told on Saturday that men would kindle a shot at 3 o'clock, and that the engine man two hours after the men have gone out of the mine has heard sounds which told him that an explosion took place. Sometimes they just kindle them and go away and leave them, and the engine man has heard the sounds of shot-firing two hours after the men have left the mine.

22683. There are a number of accidents arising in sinking dooks from runaway hutches?—That is so.

22684. A good many of your workings in the shale district are steep?—That is so

22685. You want some precaution for the workmen in dooks against runaway hutches?—We do.

22686. That is a prolific cause of accidents?—There is such an accident occasionally. We had one last year.

22687. (*Dr. Haldane.*) The men are at the bottom of the dook, and if there is a breakaway they run down into the dook face?—Yes.

22688. (*Mr. Smillie*). There are a considerable number of men working at what we call the bottom of the dook face?—Yes.

22689. You think a very simple rule might be applied to prevent injuries in the event of runaway hutches?—I do. Our suggestion is twofold: either a strong iron tree erected below the bottom road, or have open points so that when the hutches come down to that point they would run into a sort of cutting which could be made.

22690. You think runaway points would prevent such accidents?—I am certain they would.

22691. Have you been urging that upon managers?—It would not be strictly true to say that we are on the point of agitation, but there has been a great deal of discussion about it. There is no provision in the law respecting it, and we find there is great difficulty in getting anything done which is not mentioned in the law if it involves any expense.

22692. The Scottish Miners have proposed a resolution on the subject?—Yes.

22693. Have you any difficulty about the supply of prop wood, at the present time, of convenient lengths at the proper places where it is to be used?—We have wood both in shale and coal, and the practice is for the wood to be kept at the lye; frequently it is not of the proper length and when the accident takes place the workman is blamed for not having proper wood. We think the right way to meet that would be to change the law making it compulsory on the employers to provide the prop wood at the working face.

22694. The law is that it must be provided of proper lengths.—It so states, but not necessarily at the face.

22695. It must be at either the working place, where the employer is responsible for drawing the material, or at the point where the workman delivers the material.—That is so.

22696. You would make it compulsory that in every case the employer should be bound to have the timber supplied at the proper place?—Certainly. Under the Special Rules at the present time it is incumbent on the workman to have the timber within 10 yards of the working face. This is not fair. He cannot have it there unless he gets it. We think the obligation should be on the employer to have the prop wood of proper lengths at the working face.

22697. With regard to the examination of winding shafts you are aware that must be done now at certain periods, and, according to the Act, there must be an

Digitized by Google

examination of the shaft guides, conductors and other appliances?—I am aware of that, but unfortunately my experience is that that examination can take place in a very perfunctory way. It can be called an examination although the pithead man is descending the shaft in the cage and the cage never stops. I was at an inquiry on the 20th May of this year, where the evidence showed that the pitheadman was in the cage making the examination and the cage never stopped but went constantly down; consequently there was no proper examination made, with the result that a pipe found its way into the shaft and the cage came in contact with it.

22698. The usual rule is for the cage to go down slowly, unless the person examining the shaft signals for the engine winder to stop?—Yes—that was so in this particular case.

22699. You feel that, as a matter of fact, the examination which takes place at the present time generally is not a proper examination?—From the evidence at that inquiry I feel it is a sham.

22700. Is not the winding rope examined in the same way?—I have no doubt at all from the evidence that that is so.

22701. (*Dr. Haldane.*) Are there any cases of the winding rope breaking?—It does not happen so frequently now, but it occasionally happens that the rope breaks both in the winding shaft and in the haulage roads. Of course in shale mines it is very different from coal mines, because they are chiefly inclined planes, and the winding rope is a very important business, and it may be half a mile or a mile in length. It is a most important thing for the men to know it is properly examined.

22702. Do you propose, in the case of a winding rope, either for inclined planes or perpendicular shafts, that there should be any particular period it should be allowed to run before renewal?—I could not state what length of time it would take to wear it out, but I think it ought to be carefully examined every day before the commencement of the shift to see it is in good working order. In some cases it might last longer than in others, so that you could not have a fixed period.

22703. It would depend upon the nature of the atmosphere perhaps, whether it was wet or dry?—Yes, and the strain on it.

22704. Have you known cases of broken ropes in which they have been corroded on the inside, and did not show any indication of that on the outside?—I could not say, but we have had cases where it has been obvious that it was cracked partly before the final break took place.

22705 (*Mr. Smillie.*) As to the protection of roof and stoop sides in high shale workings, are there more accidents in the high shale workings through falls of roof and sides than in the ordinary four or five feet workings?—That is so. The ordinary examination is not good. I suggest there should be crowns and rances put up every 3 feet in the roof and sides of the travelling roads. Unless the crowns are put up regularly an ordinary inspection is of no use. A piece of shale falling on a workman is likely to be very serious.

22706. A small piece of shale falling would be serious if it fell any distance?—A quarter of a hundredweight falling but a few feet would kill a man. In some cases we have seams now going 10 feet, and often there is a good deal of powder smoke when it is impossible to see the roof or the stoop 12 feet wide. An ordinary examination is of no use because a man might think the thing was safe, whereas if there were crowns placed every 3 feet from each other, and a prop under them, it would render it safe.

22707. (*Dr. Haldane.*) I do not quite understand the method of working. What is a stoop?—The stoop is the pillar left in, and the room is the working place.

22708 (*Chairman.*) Is there any rule with regard to the distance the crowns must be apart?—There is no rule. At a working face a man must put in props every six feet.

22709. Besides the working face, there is no rule saying what distance the crowns must be apart?—There is no rule.

22710. They must be put up every 6 ft. at the working face; but do you not keep it up behind you until the whole thing is allowed to fall down?—That is only a tree, but I am talking of a crown. The crown going across would tend to protect the whole roof.

22711. Why should not the shale fall in between the 3 ft. space?—It is very strong; it is a good roof and of great height, and pieces fall off the side. By putting the legs close to the stoop side, there would be a guard against a fall from the stoop side, and if you put the rances across from crown to crown it would be a great preventative.

22712. (*Mr. Enoch Edwards.*) Do they not timber the roof?—A timbering is done in a very perfunctory way. When a fall takes place they send a man to timber it, but there is no systematic method of putting up crowns at a given distance—it means a little expense, and they avoid doing it so long as the law does not compel them to do it. Unfortunately when you do not impose any exact conditions it becomes a matter of individual judgment. The roadsman actually stood in the witness box and said in his opinion he had examined the shaft, in the case I have called your attention to. If you leave it to everybody's opinion, it is loosely done.

22713. (*Mr. Ratcliffe Ellis.*) You want to prescribe the way in which it could be kept safe? Just the same as it is prescribed with respect to hauling.

22714. Do not the timbering rules, adopted a few years ago, apply to shale mines?—Yes, but they do not prescribe what I am now suggesting. They require the manager to prescribe the distance from the place where the props shall be placed. Unfortunately he is not down the mine for a week, and it is a difficult job for an overman to examine all the working places in a mine—I do not think one man could do it—whereas if the crowns were put in it would not require the present inspection, because all a man would be required to do would be to examine the crowns, and if he found them in good order he would have reason for thinking it was safe. It should be part of the system of working to put in the crowns every 3 ft.

22715. In the drawing roads?—Yes. If they were put in every 3 ft., and renewed when they were broken, it would be part of the system of working, and it could be easily attended to and rendered safe.

22716. Where you want the crowns put in is in the miners working place?—Yes. If the law is altered to make it compulsory the manager has the option of arranging for its being done.

22717. I want to know where you suggest it should be done. Is it in the miner's working place where he is now required to make it safe?—No; I want it all over the working roads.

22718. Not the miner's working place?—It will come to be done there too. I want it there.

22719. You want it to be done in a particular way?—Yes, one special way.

22720. You are not discussing who is to do it at present?—Quite so.

22721. Are you supplied with the necessary timber to enable you to do it at the present time?—It is not compulsory now.

22722. Are you supplied with the timber to enable you to do it?—Not to carry out this idea.

22723. (*Dr. Haldane.*) You just put in trees?—Yes, at the working place.

22724. (*Mr. Enoch Edwards.*) The men are not called upon to put crowns up at the working face?—If it is a very bad face they are required to do it.

22725. Would they carry on the same method of timbering 6 ft. from the face as you suggest along the road?—In some cases if the roof is very bad they have to do it. they have to put up crowns to make the thing safe, and my point is that there is no obligation to do it on the road sides and stoop sides—it depends only on the men's casual observation, and that is no good.

22726. What is the gradient in these mines?—Sometimes 1 in 2, 1 in 3, 1 in 4 and 1 in 6. We have them even more steep than 1 and 2.

22727. (*Dr. Haldane.*) You say these places are not kept in a proper condition?—And cannot be under the present conditions.

22728. The manager is responsible, is he not, if an accident happens?—But he or his underman say that they examined the place and found it was safe. But I put it to you as sensible men, how can a man looking at a place 10 ft. high see by his eye that the whole thing is safe. If you had crowns you could easily detect whether a place was in a bad condition or not.

Mr. John Wilson.

13 June 1907

22729. (*Mr. Smillie.*) What you advocate is that it should be made compulsory in those thick seams to have systematic timbering through the method of crowns being put up every 3 ft.?—Yes.

22730. And you say, altogether outside who has to do it, whether the workman or the manager, it would prevent a good many accidents which now arise?—I am absolutely certain of it.

22731. Have you any idea as to the state of the ventilation in the shale mines. There is a considerable amount of blasting—is it done by means of high explosives or powder?—Chiefly powder. The ventilation in many cases is fairly good, but owing to this very heavy use of explosives, it requires special ventilation to keep the place clear. The fault I find with the Mines Act is this: the first rule states that an adequate supply of ventilation should be given, but it does not define it. I think it should be obligatory on the Mines Inspector to see that a definite quantity of air was provided in the working places. The word "adequate" is very elastic, and various people interpret it differently. I think they should say 500 cubic feet, or something of that sort—a definite quantity—so that anyone examining it, and not finding that quantity there, would know they were not doing their duty.

22732. The number of cubic feet would depend upon the number of men employed, or the number of shots fired?—According to the working conditions; but I do not think the word "adequate" is of much use.

22733. (*Dr. Haldane.*) You cannot measure how much air is going to a working face, for instance, very well?—No.

22734. You can measure what is in the main airway?—In those stoop and room workings, where you know the height and the width, I think they can obtain a very good idea by an instrument as to what is passing every second. They could see the motion of it.

22735. They would only see that in the main road?—They would see it in the main air course, and that would conduct the air round the mine; and they would see what ventilation was passing along by the motion of the current.

22736. (*Chairman.*) You suggest there should be some instrument placed near the working face which would show the rate at which the air was going?—What I suggest is this, that if the Mines Act defined what was to be kept, under certain conditions, the manager and overman occasionally—say once a week—by an examination would have a very good idea of what was passing all along by the strength of the current.

22737. You might say that if the current was going at so many miles an hour that would show that the ventilation was good?—Still, the question of cubic feet has something to do with it. Where the air course is very wide a slower current would take along a much greater quantity of air.

22738. You then suggest that in an airway of particular dimensions the current should be so many miles an hour, and in another airway it should be more, and so on?—That is what I mean.

22739. (*Mr. Ratcliffe Ellis.*) With reference to the haulage, I suppose anything that could be devised to prevent tubs running down an incline, or, if they did escape, prevent their doing mischief, you would be quite content to accept? There might be something better than that which you suggest, might there not?—I may state under the present system they have what is called a jock, that is an instrument attached to the end of the hutches with two prongs attached to it, and whenever a breakaway takes place, that is supposed to catch in the sleepers and turn the hutches off the road. We had an accident arising from that last year—from the jocks not being put on—consequently I think if you had runaway points it would prevent all that.

22740. If there was anything better that could be devised you would not object to it. You say what is there at present is not sufficient, and you want something to make the mischief as small as possible if they do run away?—Yes, the best arrangement that can be got.

22741. You say you have a good deal of shot-firing in your mines?—A very great deal.

22742. Do the rules in the Coal Mines Act apply to the shale mines?—Yes.

22743. Have you anything to suggest beyond what is provided for in the Act?—The suggestion I make is the one which Mr. Smillie referred to, namely, when a shot misses the miner should not be allowed to tamper with that shot until the next day.

22744. You think there should be a fixed time?—Yes, and that fixed time should not be during that shift.

22745. That should not be left to his discretion?—That is so.

22746. Where the shot is fired is in some man's working place?—Always in a working place.

22747. Supposing a shot was fired between the shifts, and then a working shift comes on after that, is the man in that place not to do any work the next day?—What I suggest is this: supposing a shot misfired at three o'clock, then no work should be done in that place for that day, and by the next morning there would be a sufficient lapse of time to have extinguished any fire in the hole.

22748. That would result in the miner not being able to work at all on the following day?—Not for that shift. He would be able to work the following day, because there would be sufficient time to allow the fuse to go out. He would have to begin the next morning, and bore a new hole.

22749. You think it would not be proper to go there again that shift?—I am certain it would not.

22750. What is the length of time you think a shot may remain without exploding?—The men have told me that they have gone back at the end of an hour in some cases, and it was quite safe; but we have had cases of men going back at the end of an hour and saying it was then safe, whereas the engine-men have heard shots going off two or three hours after the men left the mine.

22751. How are they fired?—By a strum or fuse. I may say the men kindle five or six in some cases, and so save their having to go back into the smoke again after each shot.

22752. They cannot examine all the shots immediately after?—They examine the whole place the next morning.

22753. If they have not examined all the five, or make a mistake, then one might not have gone off?—That would involve their going back in half an hour to see; but if they did not go back until the next morning they then know it has either gone off or gone out.

22754. You think it should be a rule that if a shot has not fired it should not be dealt with until the following shift?—Yes, a lapse of seven or eight hours.

22755. Do you see any objection to firing more than one shot at a time?—Not necessarily, with practical men. Supposing the place is so thick with smoke that you could not see 2 feet before you, if you had to go back and kindle every shot that would be a very terrible experience.

22756. Are you aware that there are districts where the height is as great as yours, and probably greater, and where the system of timbering you recommend is adopted?—I am glad to hear it.

22757. Under the General Rules?—But it is not compulsory.

22758. The manager is responsible if he does not keep it safe, and he considers the only way to do it is something on the lines which you suggest?—My reply to that is that that is a matter of opinion. Where you have a good manager he will do it, but where you have a man limiting the expense he will not do it—and it is not being done just now in shale mines.

22759. (*Dr. Haldane.*) When there is an inquiry, does not that matter come up?—It does, but the man is dead by that time; there is no change in the law, and it will simply go on.

22760. (*Mr. Ratcliffe Ellis.*) Has the present system never been questioned as to whether it is safe or not?—Our means just now of rectifying that are very clumsy. We could not ask the company to do it now; they are not bound by law to do it. An inquiry takes place after the man is dead; the evidence then comes out, and it all depends upon the good sense of the manager and the employer whether they have a lesson from that inquiry or not. They are not obliged to do it.

22761. The question is how much detail would you prescribe. What it requires now is that it should be kept safe. You do not want to give the management any discretion as to the means they should adopt, but you want to say that they should adopt certain means?

Digitized by Google

—There is no safety where it is left to everybody's individual opinion. I want them to adopt the same rule as with regard to holing.

22762. There is a little discretion there.—Not beyond 6 ft.

22763. You might apply that to almost everything in the Mines Act?—I am dealing with cases coming under my own experience.

22764. (*Dr. Haldane.*) The purpose of the new Accidents Inquiry Act is to enable questions like this to be thoroughly threshed out before a jury?—Yes, it is being done now; but then these inquiries do not change the law, unfortunately.

22765. Supposing in the opinion of a jury the method of working is unsafe, they will return a verdict to that effect, will they not?—Yes, if they are asked, they may do it.

22766. A manager surely cannot go in the face of that?—They can go in the face of that. They often pay compensation, but compensation does not bring dead men back to life.

22767. It would be a question of compensation in any case?—So long as a man can say in his opinion he thought it was safe, that is sufficient.

22768. (*Mr. Ratcliffe Ellis*) General Rule 21 is: "The roof and sides of every travelling road and working place shall be made secure, and a person shall not, unless appointed for the purpose of exploring or repairing, travel or work in any such travelling road or working place which is not so made secure." There is no abstract point; it is a specific obligation, and the manager is liable if that is not done. You want to go further and say they must adopt a particular way of securing that. Now suppose the manager does that, and it is not safe, what then?—My view is that in 19 cases out of 20 where accidents occur, they occur from falls of the roofs and sides. You might think it is safe, and I think it is unsafe.

22769. You might be mistaken possibly as to your view of keeping it safe. If the manager adopted your view he would not be relieved from responsibility if it was not safe?—What I affirm is, that if my idea was carried out the bulk of cases of accidents due from falls of roof would be prevented. If a man saw a crown was broken he would know it was not safe; but if now he looks up 10 ft. he cannot possibly say whether it is safe or not.

22770. Supposing a manager adopted your view, he would be responsible if it was wrong and not you?—He would be responsible; but if he did what I am suggesting now he would be relieved from the bulk of the accidents.

22771. That may be so or not. You want to prescribe the way in which it is to be made secure?—That is so.

22772. Now, as to the timber. Where now is the timber taken to by the management?—In general cases the lye, where the drawers get the hutches.

22773. That is the passbye. Where the full tubs are taken to, and the empty tubs are taken from?—Yes.

22774. You make a complaint that the timber is not in suitable lengths?—My complaint is, that it is not to be got in the lye always in suitable lengths.

22775. That is an offence against the law?—There is this to be said about it, when a man has an accident a quibble arises as to whether there was timber there or not.

22776. That is a question of fact. If a manager is summoned for not having timber there, and then if he says there was timber there, and someone else says there was not, whoever tries the case has to decide who is telling the truth?—Yes.

22777. That is not the point. Where the manager has to have the timber in sufficient quantity is where they get the empty hutches?—Yes.

22778. What is the difficulty about that?—If it was put where I suggest, the faceman would not have to blame the drawer—he would go out and get it himself.

22779. It is part of his business, when he takes the full tub, to bring back the empty tub. What difficulty is there in putting the timber on the empty tub and bringing it back to the face?—There is this difficulty: he cannot bring it if it is not there.

22780. The manager is responsible for that, and I cannot see what difficulty there would be in his putting it into the empty tub and bringing it to the face?—The difficulty is not exactly obvious, but there is a difficulty If a man has a drawer the drawer has to remember to put the wood in of proper length; whereas, according to my idea, the Company must have an official in the lye who had examined the working face and would know there was wood required there, and he would say, "There is the wood."

22781. You do not want to have an unnecessary quantity of timber near the working face—there is no room for it?—A road the proper width would have room for the timber.

22782. When the collier sends his drawer he says, "I want props of such and such a size." The drawer brings the exact props he wants from the gate-end where there is a large store of timber. How would you get over that difficulty? The collier does not know in the morning exactly the quantity and size of timber he wants.—I think you are wrong in that about the size. Generally, in 95 cases out of 100, a faceman does know to an inch the height of the wood he wants for the whole of the day. Taking one day with the other he would. He would have an adequate supply—a liberal supply.

22783. You do not want a store of wood placed outside your working face; you want just what you require. Is it not more convenient for the drawer to go down to the gate-end and bring in the tub exactly what is the quantity required, than to have a large quantity of timber which may not be wanted, and messing up the place?—I do not agree with you. In stoop and room shale mine working, a very small place would hold what wood was wanted for a week. A man will not go more than a fathom-and-a-half or two fathoms in one week, and a very small place would keep sufficient wood for a fortnight. There are other difficulties. Take, for example, a man killed to-day in the mine—his drawer may have told him, "I looked in the lye and there was no wood." By the time of the inquiry we have the greatest difficulty in preventing the official having people in the witness-box to say there was wood in the lye on that occasion, whereas we know there was not. Under my system it would be different.

22784. Would your system make all people truthful?—The face could be examined at the time of the acoident to see whether there was wood there. The obligation should be on the company to have the wood there.

22785. You would shift the obligation from the drawer and the collier on to the management?—Yes, on to the management.

22786. Do you propose to make any reduction from the wages for the increased responsibility which you will put upon the management, and which you are taking from the collier and drawer?—I think you are joking now.

22787. Indeed I am not. At present they are paid for doing certain work, which includes taking the wood there, and they are responsible for it. You want to relieve them of that responsibility and put it upon the manager?—My reply to that is this, that that will adjust itself.

22788. How?—Under the present system the management allow the men to earn certain wages, and when they find they are paying too high a rate they give them notice of that, and the end is we find they have to take something off. That will adjust itself between the manager and the workmen's agents.

22789. You admit it is a case for adjustment?—I admit there might be something in it.

22790. That is perhaps all I ought to ask you to admit. When you speak about an examination of the guides, &c., do you mean the ropes?—I mean all the woodwork, and all the other things in the shaft which are a fixture. I mean everything about the shaft.

22791. General Rule 20 is: "Where the natural strata are not safe, every working or pumping shaft shall be securely cased, lined or otherwise made secure?" That provides for the shaft being made secure?—Yes.

22792. Then we have Special Rule 48: "They (the roadsmen) shall, at least once in twenty-four hours, examine the state of the external parts of the machinery, the state of the guides and conductors in the shaft, and the state of the ropes, chains, and other similar appliances of the mine which are in actual use below ground, and shall make a true report of the result of such examination, and every such report shall be recorded without delay in a book to be kept at the mine for the purpose, and

Digitized by Google

Mr. John Wilson.

13 June 1907

shall be signed by the roadsman making the examination." Do you want anything more than that, if it is carried out?—I want more than that, because you will get men to go into the witness-box now to tell you that they made an examination, whereas they go on the cage and until they get to the bottom the cage is constantly in motion, and they have only a naked light to see it with

22793. If this requirement is complied with do you want anything more than that?—Yes, I do, I want far more.

22794. Even if this is complied with "At least in every twenty-four hours examine the state of the external parts of the machinery, the state of the guides and conductors in the shaft, and the state of the ropes, chains, and other similar appliances of the mine which are in actual use below ground, and shall make a true report."—It does not say "properly."

22795. I will assume it means "properly." Do you want more than that?—I do not want to discuss the means.

22796. If there is a proper examination made, as required by the rule, do you want anything more than that?—It does not say properly done.

22797. If it is properly done?—That is a matter of opinion again.

22798. I want to go by stages. If it is properly done do you want more than that?—Yes. If you and I first agree as to what is "properly done," I will agree with you.

22799. If it is done as you think it ought to be done. You do not want to put that in the rule, "If it is done as Mr. Wilson thinks it should be done"?—I want that the cage should stop at every 6 ft. He goes on the cage and down to the pit bottom and the cage never stands, and he is just looking round.

22800. There is no way which would satisfy you unless it is provided that the cage must be stopped at every 6 ft.?—Yes, and no man in this room could do it unless it is done in that way.

22801. If it stopped every foot would it satisfy you?—That is an extreme statement to make. It would not be required to stop every foot.

22802. You are not satisfied with this rule unless it provides how it should be done specifically?—It must prescribe a specific examination.

22803. You say that your method is the best of all?—I say what I suggest gives one of the conditions of a sound examination. I do not say it gives all the conditions.

22804. With reference to ventilation, how often do you say the air should be measured?—What I do say is that, where the height and the width, and the cubical area of the air-course is known, an examination of the current, say twice a week, with ordinary care would suffice for ascertaining if there was an adequate supply of air, provided you first define what an adequate supply is.

22805. Can you define an adequate supply of air?—I think that is a question for a scientific expert—a man who has studied the matter thoroughly—just as you do now with school houses and public buildings where a number of people are working. The space and so on is defined.

22806. You do not feel competent to describe it?—If I had known you were going to put it in that way I should certainly have improved my knowledge before I came here; that is not the sort of information I require every day.

22807. If you had any views it might be useful to give them to us?—I will be perfectly frank with you; I do not pretend to know things I do not know.

22808. There is a provision for the air currents being examined in General Rule 1: "In the case of mines required by this Act to be under the control of a certified manager the quantity of air in the respective splits or currents shall at least once every month be entered in a book to be kept for the purpose at the mine?—I do not think that is a very frequent examination; and besides, my point is this, that that does not provide any guide as to what is to be an adequate supply of ventilation under the existing conditions.

22809. It says "Shall at least once every month be measured and entered in a book to be kept for the purpose at the mine"?—I do not think that is sufficient.

22810-1. How often is it measured in your mine?—Judging from the reports of the workmen I should say in many cases it is not once a month, but on that point I would not like to dogmatise.

22812. (*Mr. Enoch Edwards.*) Your evidence refers only to shale mines?—I am prepared to give evidence in regard to coal.

22813. But now it is given in reference to shale mines only?—Yes.

22814. You have been asked about measuring the ventilation twice a week. Do you mean measuring the amount that goes down the shaft, or measuring the air abstracted on the working faces?—The working faces.

22815. You say that sometimes they fire five or six shots at a time?—Yes.

22816. That would be, I suppose, to cover the whole width of the face?—Yes.

22817. And they so arrange them that by a longer or shorter length of the fuse a man can go to his place and clear it. You do not work by shifts?—In some cases.

22818. I understood you to say they were fired at the close of the shift?—Yes, fired at 3 o'clock, and another shift might come on at 10 o'clock.

22819. So that the tubes are cleared when the other men come on?—Yes.

22820. What do you mean by men coming back to them. Are all the shots fired at the close of the shift?—No, there are a great many cases in which the men are firing shots every half-hour in the day.

22821. They occasionally get a missfire?—Yes.

22822. And they may go in too early and the shot go off afterwards?—The shot may go off while they are in the place.

22823. Have you had experience of that?—Yes, I should say every year we have one or two bad cases. I had a bad case at Ingleston last year where both shots missed, and the man went back to one and put it right, and then he went to the second one, and it went off and killed him.

22824. (*Dr. Haldane.*) How long was that after?—Inside the hour.

22825. (*Mr. Enoch Edwards.*) We have had evidence already about that. You say in the case of shots fired during the working of the shift, where two or three are fired and one happens to miss, there is considerable risk, and you have had accidents from that?—Let me correct this; it is not the practice amongst our men to fire more than one shot at a time during the day, but at night when they are firing shots at 3 o'clock they may fire four or five at once, but they do not go back on the shots.

22826. In reference to firing those four or five shots at the close of the shift, you do not suggest that there has been any accident to the men going back the next morning?—Not after seven or eight hours' interval.

22827. You suggest that if this happened in the day time the man would have to go?—Yes, and my opinion is that a man's life is of more importance than his work—and if it misses fire he should go home. There is no doubt about that.

22828. In reference to the question of timbering, does the seam run pretty uniform?—I should say there would not be many faults in it unless it might be one every 100 yards.

22829. There is no great difficulty as to the length of props required?—Not generally.

22830. Do they sink their props at all in the floor?—They sink them one or two inches if it is required.

22831. If it is too long that is what they do?—That is what they do if it is too long.

22832. Is there much complaint about lack of timber?—Occasionally both in coal and shale.

22833. You say if they are properly timbered you have a greater guarantee of safety than you have if they are left without timber?—The greatest guarantee I know—and then it is easy to see under the system I propose when things are wrong.

22834. When the props are broken you can replace them?—Yes.

22835. (*Dr. Haldane.*) What is it that you think is specially unsatisfactory about the ventilation? Is it the prevalence of powder smoke or is it gases in the air?—

Digitized by Google

In many cases the current is not sufficient, and there is no sufficient rule. There is just the word "adequate," which people look at differently.

22836. What is wrong with the air, is it bad smoke, or gas, or black damp in it?—That is one fault. In many cases it arises in this way, that where there is a sufficient quantity of air going down the shaft it is not properly conducted round the mine.

22837. What is wrong with the air at the face? Is it the amount of powder smoke or gases arising from minerals?—You mean its chemical composition at the face?

22838. Is it the smoke, or the heat, or the fact that a light will not burn properly that troubles the men?—If the air is bad at the face there is an accumulation of lamp reek, and they see it is in a bad condition; and if they are firing shots it becomes in a very bad state, and in some cases you cannot see 2 ft. before you. If there was a specific condition in the law that there must be so many cubic feet passing per second you could determine that by measuring the current.

22839. You could easily measure the air into the split in the mine on the main airway; but when you get actually up to the working face it is a very difficult thing to examine it with an anemometer.—In the stoop and room workings they conduct it with a screen-cloth, and that is brought within 6 ft. or 7 ft. of the working face. There would be no difficulty in seeing from the anemometer if there was a good current of air. Men can see it from the lamp when they hold the lamp out.

22840. You are aware that an anemometer is not a very delicate instrument?—Yes.

22841. It takes a fairly good current to move an anemometer?—That is so, and we want a good current.

22842. (*Chairman.*) There is a Special Rule about timbering which seems to apply to Scotland only. The last Special Rule is: "In addition to a supply of suitable timber being provided at the working place, gate-end, passbye, siding or similar place (in terms of General Rule 22), the miners where the timbering of the working places is done by them shall keep a sufficient supply of suitable timber for immediate use at or within ten yards of every working place where mineral is being gotten by them, unless where exceptional conditions render this inconvenient." You say it is very hard that a workman should be punished for contravention of this rule, whereas the manager is only bound to provide timber at the gate-end, which may be a long way off?—Yes, and that is very unfair; it should be provided at the face.

22843. It seems in Scotland there can be no objection raised to that, because you have a Special Rule which makes it incumbent upon the men, at all events, where that is not inconvenient to have the timber at the face?—That is so. There are one or two other points I should like to mention before I conclude, if you will allow me. The first is this, I think the present Inspectors are inadequate. We have only half a dozen, and we think there should be one for every 10,000 men. The next is under General Rule 38; it gives the miners power to appoint two men to examine once a month. I think it should be made compulsory on the men to appoint two men to make the inspection once a month, and the law should be altered to allow independent practical men to make the inspection.

22844. What do you mean by independent practical men?—A man like myself, or a practical mining check-weigher, and not dependent upon the employers, who would do this work much more thoroughly.

22845. (*Mr. Enoch Edwards.*) Would the employers object to your examining?—Some of them would not, but the bulk of them would. Further, I think the law should be changed so that firemen could be appointed and dismissed by the Government Inspector, and paid by the employer. At the present time a fireman is simply an employé of the employer, and he must consult the employer when a question takes place; whereas if he was appointed and dismissed by the Inspector and paid by the employer he would be a far more efficient man.

22846. (*Chairman.*) What you say is that he should be appointed by the inspector and not by the manager?—I think the appointment of firemen should rest with the inspectors.

22847. (*Dr. Haldane.*) How are the inspectors to know his capabilities?—I think the firemen should be subject to a proper examination, and obtain a certificate to qualify them for the work. The inspectors would know the men and have a list of them, and they would know exactly the kind of men to appoint. They would have a personal knowledge of most of the men.

22848. (*Chairman.*) The inspector would have a knowledge of them?—He would; he would not have an intimate knowledge, but a very general knowledge, of most of them. Then, further, I do not think the Special Rules should be enforceable unless they are endorsed by a joint committee representing the employers and the men. At present it is slipshod. If the manager can get the Inspector and the Secretary of State to adopt Special Rules, although they have not the men's consent, they can be enforced. It is admitted the men can object, but it is a haphazard way for them to object, and I think the rules should have the endorsement of a joint-committee. In regard to cages, I think the present law is dangerous and loose. There is no rule whereby they must have iron bars on each side of the cage, or a door to prevent men falling out. In hydraulic lifts they have bars which will go together like a sponge. and I think they should have such bars on cages so that they could be closed, and the men could not fall out, We have accidents every year through men falling out of the cages.

22849. (*Mr. F. L. Davis.*) Do you know of cases where an accident has occurred and men may have been able to jump out, but have been prevented from doing so because of the bars?—I do not know of a case. My experience arises from men falling out. Then there is no prevention of over-winding. The rule says the speed shall not be more than three miles an hour. I do not think that is adequate, I think we should have a law making the adoption of preventative measures compulsory. In regard to the managers, I think the present law is loose. A man can now sit for his certificate if he can show he has had five years' practical experience in a mine. That is interpreted very loosely. A man enters a mine say at 13; he is a pony driver or a general on-cost worker, and he may never have worked at the face in his life—but according to that he can sit and become qualified. I do not think it is fair to the men to have a man to dismiss and pay them who has no real knowledge as a practical miner. I think he should have had four or five years' practical experience as a working miner at the face. Further, in General Rule 39 you have a provision that no person can be employed at the face unless he has two years' experience under a practical miner. That is a very loose rule. One man cannot be allowed to work alone at the face—two unskilled men can work. We think that should be altered, and that no man or men should be allowed to have charge unless he or they have been trained for a certain number of years under a practical working miner. Under the present law a man cannot sit for an examination unless he pays £2 for the First Class Certificate and £1 for the Second Class Certificate. I do not think the State are so very hard up as to exact those fees from a working miner. Oftentimes a man has a family, and there is great pinch in providing the £2. I think that should be removed in both cases.

22850. (*Chairman.*) It is worth the £2 to him?—If you made it obligatory that he should pay £2 if he passed and got his parchment, he would be getting value for his money; but for a man to pay £2, and have the worry of the examination and not pass, is too much.

22851. (*Dr. Haldane.*) The examiner has to read his papers?—But he is paid for that.

22852. Out of the fees?—That may be. Then with reference to the investigation of mining accidents, I should like to suggest an improvement. I think the Procurator Fiscal, who manages the inquiry, should not be a practising lawyer who may be doing private business with the employer. We find where that is the case they are very keen sometimes to prevent us putting nasty questions. I suggest that the Procurator Fiscal who manages the inquiry should not be a man engaged in private practice and acting for the employers. Further, we think there should be a verbatim report of the inquiry, and that the representatives of the deceased should get a free copy of that report. This would all tend to make managers pull up, if they felt there would be a thorough inquiry and report. If they were to be thoroughly exposed when they neglected their business, those things would be very useful.

Then, again, there is no proper sanitation just now in the mines—none whatever. A man cannot even get a drink of water. The employer is under no obligation to

Digitized by Google

Mr. John Wilson.

13 June 1907

supply it, but a very little expense, I believe a halfpenny a ton, would provide the putting of a half-inch pipe all round the mine which would enable a supply of water to be obtained.

Further, with regard to human refuse, it is really very shameful. A man goes in some 50 yards from the face and performs a natural function, and it is left lying there. Proper facilities should be provided. A trench could be dug and a pail put into it, and there should be one of those in the shale workings at every upset close to the face, which should be removed regularly. In my judgment, it would be infinitely better for the men than to have the ventilation beating on this refuse and the microbes polluting the atmosphere. I do not believe the water and the natural facilities would involve a cost of more than a farthing or halfpenny a ton, and, in my judgment, it would very greatly improve the healthy condition of the working miners. I hope that this Commission will at least give some attention to that very simple precaution, because there is none just now. It is simply disgraceful. In many cases the men cannot get a drink of water. There is a small trench and the water gathers, and the men are supposed to drink that when it settles. It trickles along the pavement and comes from places where no man should be allowed to drink it from. I hope some precaution will be taken to alter the present disgraceful condition of things.

22853. (*Dr. Haldane.*) Do not the men take water down with them?—They may, but that, of course, is very inconvenient very often.

22854. You could not have a tap everywhere?—I did not say that—you would have it in the lye.

22855. (*Mr. Smillie.*) When you said that under General Rule 38 the workmen should be compelled to make an examination, did you mean that you had passed a resolution to that effect?—I must admit that we have not come to a resolution upon that. I am speaking from my experience that it should be compulsory on the men to make the examination.

22856. You would not put it that the miners are of that opinion?—I certainly would not say I have a mandate from the men to state that one point here.

22857. What you have said this morning with that exception represents the views of the Federation?—I am speaking for the shale miners primarily. I did not have a mandate in regard to this matter about the water; but I think the general body of the miners would be in favour of that if you gave it to them, and would thank you very much.

22858. (*Mr. Ratcliffe Ellis.*) How long ago is it since you worked in a mine?—I have not worked in a mine for 21 years.

22859. For how long did you work in a mine?—From the age of 13, I think, until I was 24½—shale and coal and iron.

22860. About 11½ years?—That is so.

22861. (*Dr. Haldane.*) Is the work in a shale mine dirty work, and do the men get black?—The men's faces are cleaner than when working in coal. The powder smoke, though thick, does not black the face like coal dust.

22862. There is not so much black dust about as there is in a coal mine?—No.

22863. We have had some evidence with respect to the desirability of providing baths at the surface. That would not be such an important matter in a shale mine as in a coal mine?—I do not know that I have a mandate to make the suggestion, but I certainly think if there were facilities for men washing themselves when leaving work, and being able to leave their pit clothes there, it would be a great improvement.

There is another matter:—Under the present law the employers are not bound to supply an ambulance wagon—they are bound to supply stretchers and splints—to take a man to the infirmary. We had a bad case last year, where a man was badly injured and died within three hours; but he was kept lying on the pit bank for two hours before they obtained an ambulance wagon. Now that may have been a case where if they could have got him away quicker his life would have been saved. I think it should be compulsory on the employers to have an ambulance at every colliery so as to remove men under such circumstances—I do not mean every single pit but every colliery. I may say that the Miner's Federation have adopted that suggestion. I do not know whether it has been mentioned, but they have passed a resolution in favour of it.

MR. RICHARD MCPHEE, called and examined.

Mr. Richard McPhee.

STATEMENT OF WITNESS.

22863A. I have had 26 years' experience of mines, 14 years as manager, 3 years as an overman, and the balance as fireman, roadsman, and oncost man. I am at present manager at Bothwell Park Colliery, owned by William Baird & Co., Limited, where nearly 600 men and boys are employed; 180 of that number are Poles. The output of coal is 217,000 tons per annum, and is got from four seams, with bad roofs compared with roofs in the other collieries of Lanarkshire. The haulage is mechanical throughout, with compressed air as the motive-power, and ropes are carried up to within an average distance of 70 yards from the face. I have had 11½ years' experience of Poles, and for the last 5 years the average number employed would amount to 180. I have found some of them equally as good as the British workmen under ordinary conditions, and all of them more amenable to the discipline of the mine. While socially some are not all that could be desired, others are good citizens and are very thrifty, many of them having bank accounts to their credit. They were first introduced to this country in a labour dispute at an ironworks in Ayrshire, many of them since then finding their way to the mines, they in turn bringing others. When a new Pole goes to work along with an experienced Pole he does not as a rule get an equal share of the money, but is paid what he is worth. In that respect they are not worse than the British are, as they (the British) take a novice or a boy down with them, and claim full ben of hutches and pay the novice and the boy their value, which may be anything from 1s. 6d. to 2s. 6d. less than the value of their share, and the man who employs them pockets this which makes his earnings a long way above the current wage. We have Poles working in the same place and in neighbouring places at the same rates as British workmen. We have not had a single accident to British workmen through Poles not knowing the rules and regulations. We have the rules printed in Polish and posted up, also have circulated copies to those who could read them. For the past five years we have had only two fatal accidents—one of these was caused by the deceased wilfully pulling the cap wires from a borehole that was charged with saxonite and stemmed. The charge exploded, and he was killed instantaneously. The other was caused by a fireman going in too quickly to a roadhead after firing a shot, when a stone that was loosened by the shot fell on top of him. There were eight accidents to British workmen reported to the inspector of mines, and three to foreign workmen.

22864. (*Chairman.*) You have had 26 years' experience of mines, 14 years a manager and the balance as overman, fireman, roadsman and oncost man. What does an oncost man do?—Ordinary repairing work.

22865. There are 600 men and boys employed in your colliery, and 180 of that number are Poles. You have had 11½ years' experience of Poles, and for the last five years the average employed would amount to 180. You have found some of them equally as good as the British workman, and all of them more amenable to the discipline of the mine. We have been told that amongst themselves they are extremely quarrelsome. Is that so?—We do not find that.

22866. You have no difficulty with them, either among themselves or in their relations with other workmen?—No.

22867. As regards discipline, they are more easily managed than the Scottish men?—Yes, that is so.

22868. They were first introduced in consequence of a labour dispute, and they brought in others. When a Pole goes to work along with an experienced Pole, he does not as a rule get an equal share of the money. He does not get the ordinary wage of a miner, but merely what he is worth?—Yes.

Digitized by Google

22869. In course of time, when they get skilled, they get the same wages and belong to Trade Unions?—Yes; from the very start, I should mention, they become Trade Unionists.

(*Dr Haldane.*) How is it they work at a lower wage?

22870. (*Mr. F. L. Davis.*) That is contract work?—They are paid according to their ability.

22871. (*Chairman.*) They are paid in the same way in the British mines. A novice or boy is taken down with miners and paid anything that his work is worth. You have not had a single accident to British workmen through Poles not knowing the rules and regulations. How do you see that the Poles comply with these rules and regulations if they do not know the language? How can you make them understand what they have to do and not to do?—They are educated from first going into the mine. We post up the rules in Polish, and also circulate copies amongst the Poles who can read.

22872. You find they mostly can read their own language?—Not most of them; a good few can.

22873. They tell the others?—Yes. When the Pole comes to the country he is taken in hand by an experienced Pole who has been employed in the mine for some time, and educated into the method of working, and the rules at the same time.

22874. Do you find that satisfactory?—Yes.

22875. You have had no difficulty in working with these 180 Poles?—Not the slightest, any more than we have with the other men.

22876. You say for the past five years that you have only had two fatal accidents. Do you mean caused by Poles?—No, two British workmen. We have had no fatal accidents with the Poles.

22877. Only two fatal accidents?—Yes, in the five years for an output of 1,085,000 tons.

22878. One of these was caused by the deceased—would that be the Pole?—wilfully pulling the cap wires from a borehole?—No, he was an Irishman named Dan Lynch, a thoroughly experienced man, who was making a manhole on a haulage road, and he had bored a hole, and he charged it with saxonite——

22879. We need not enquire into that, because it has nothing to do with the Poles. Of the reported accidents in five years there were eight to British workmen and three to foreign workmen. That is such a small number you can hardly get an average. You employ 600 men and boys. That is something over 400 British men and boys and 180 Poles. Therefore, it is very much the ordinary proportion you would expect?—Yes.

22880. The accidents are pretty much in proportion to the numbers?—The percentage is 30 to British workmen and 25 to Poles.

22881. (*Mr. Ratcliffe Ellis.*) You have two Poles here?—Yes.

22882. Have they been in this country long?—The eldest of the Poles has been in the country for eight years.

22883. Has he worked during that time under you—Yes.

22884. How long has the other been here?—He has been in the country seven years.

22885. And worked all that time under you?—He has been employed for three years as a drawer-off in the pit top, and the remaining four years as an underground worker.

22886. (*Chairman.*) Do they understand the English language?—The elder fellow does, and the other as much as is needed.

22887. (*Mr. Smillie.*) You say the average number of workmen you have had during the last 10 years is 180?—During the last five years. The five years before that it would be much less.

22888. Is it a fact you have fewer now than at any time for the five years?—No. That census was taken on the 17th May, and we have rather less this month than last, probably by six. *Mr. Richard McPhee.* 13 June 1907

22889. Do you post up the Special Rules and the Coal Mines Regulation Act in the Polish language?—No, in Lictwish.

22890. Are not the men you refer to as Poles, Lithuanians?—They may be.

22891. Do they belong to Poland?—They are commonly called Poles.

22892. Do they belong to Poland?—Most of them.

22893. Are you sure of that?—I would not like to say that every man belongs to Poland.

22894. Is it not the fact that the large majority of the workmen are Lithuanians?—Yes, but there is very little difference.

22895. They have a different language?—They have the same books.

22896. Have you found a very strong feeling among the foreign workmen: if you call them Poles they say they are not Polish men, they are Lithuanians, and have a language and literature of their own of which they are proud?—I have not found a Pole take objection to being called a Pole, except a German, who resented it very much.

22897. These men are members of our Trade Unions, and we are now printing our rules in their language, but it is not in Polish. It is in the Polish language that you have those rules posted at the colliery?—It is in Lictwish.

22898. And all the workmen who read and write understand that?—Yes.

22899. What proportion of those 180 understand English? Do any of them?—There will be a few.

22900. You have agents holding morning meetings at your collieries very often?—Yes.

22901. Would I be correct in saying that 75 per cent. of those men do not understand the speeches delivered to them?—I do not think so.

22902. I would be wrong if I said so?—There is a method of speaking to these men. The speeches that are made by the miners' leaders may not be understood by the Poles, but when it comes to our officials to deal with them in a sort of pigeon English we have no difficulty in getting them to understand.

22903. It has created almost a new language?—I do not know if pigeon English is looked upon as a new thing. It is as old as pigeon Scotch, or something of that kind.

22904. The foreign workmen usually work in companies; they do not mix up so much. The managers usually endeavour to have them in sections by themselves?—We make no arrangement for that; we have Poles working with British workmen.

22905. I think in Bairds' colliery generally. Do you know what takes place at Craighead and Priory. That is done in some of Bairds' collieries?—We have sections confined to Poles, but not for the express purpose of isolating them.

22906. Do you find those very good men, willing to obey all orders, and carry out the law so far as possible?—Yes.

22907. You have no fault to find with them at all?—None.

22908. (*Chairman.*) What are their names?—That one is William Yorksin, of 72, Bothwell Park Rows.

22909. Is that what you call them?—That is the name that passes through the books.

22910. What is the name of the other one?—Joe Ymities, of 62, Bothwell Park Rows.

Mr. WILLIAM YORKSIN, called and examined.

22911. (*Dr. Haldane.*) You have been eight years in Scotland?—Yes. *Mr. William Yorksin.*

22912. Did you ever work in a mine in any other country?—Yes, on a farm.

22913. You came straight from there to Scotland?—Yes.

22914. What was it that brought you to Scotland; you had friends here?—No, just myself, single.

22915. How did you know where to come to?—There are some people who send letters for us to come.

22916. Did any of your friends in your own home work in the mines in Westphalia, in Prussia?—No.

Digitized by Google

Mr. William Yorksin.

13 June 1907

22917. They never go there?—No.

22918. In Westphalia, in Germany?—No; no places. It is the first time they came to Scotland.

22919. They came to Scotland?—They came to Scotland.

22920. Do the men from the same part of the country go also to the mines in Westphalia, in Germany?—Yes.

22921. Some go?—Some go.

22922. There are a great many there. I have seen many of your countrymen there. I think they are in Westphalia. Can you speak German?—No.

(*Mr. McPhee.*) We have a number of Poles from Westphalia, and some have been employed in coal mines in Poland.

(*Dr. Haldane.*) In Cracow.

(*Mr. Smillie.*) The majority are agricultural labourers.

(*Mr. McPhee.*) We have some from the mines in Poland.

22923. (*Dr. Haldane.*) Do you like Scotland?

(*Witness.*) Well enough. It is a fine country. We like Scotland.

22924. The wages are good on the whole?—Fine wages. Five, six, seven, eight, or more different works to go to.

22925. Do you think your countrymen are happy here?—Yes.

22926. You would rather not go back? Would you rather stay here than go back?—For pay?

22927. Would you like to go back to your own country again?—Who said it?

(*Mr. McPhee.*) This man has a wife and family in Poland.

(*Dr. Haldane.*) Are they not coming over?

(*Mr. McPhee.*) No, she refuses to leave the country They are a passing population. Nearly 30 left our district last Tuesday for Canada, some to be employed in the mines and some on the railway.

(*Mr. Smillie.*) A large number of our foreign workmen have gone to America during the past. They come from Poland here, stay a short time, and then go to America.

(*Mr. McPhee.*) Yes.

(*Mr. Smillie.*) Do you know whether compensation is paid to those men just as freely as to British workmen?

(*Mr. McPhee.*) In our colliery?

(*Mr. Smillie.*) Generally.

(*Mr. McPhee.*) In our colliery, certainly.

(*Mr. Smillie.*) Have you known the Scottish Mine-owners' Association refuse to pay the widow of a foreign workman who is killed, on the ground that she was not here and was not a naturalised British subject?

(*Mr. McPhee.*) I do not know that. know there is a great amount of malingering. There is a higher percentage among the foreign workmen than the English workmen, and for the least injury they look for compensation.

(*Mr. Smillie.*) In things of that kind they are very well able to look after themselves?

(*Mr. McPhee.*) Very well. That is the main difficulty we have in dealing with them; they demand an exorbitant price when it comes to digging coal, or any other class of work.

(*Mr. Smillie.*) You find some of the men are very sharp and clever?

(*Mr. McPhee.*) Some who have been 18 months in the country can speak fluently. Usually when you get a man of that stamp he does not stay long.

(*Dr. Haldane.*) Do you come from German territory?

(*Mr. Ymities.*) I come from Russian country.

(*Mr. Smillie.*) All your countrymen are from Russian Poland?

(*Mr. Ymities.*) Yes, all the same. It is the same country. There is a different set.

(*Mr. Smillie.*) You have more freedom here than you do at home?

(*Mr. Ymities.*) Yes.

(*Mr. Smillie.*) A good many of your countrymen come here in order to avoid serving in the army; they do not want to serve in the Russian Army?

(*Mr. Ymities.*) No, they do not like to go soldiers.

(*Mr. McPhee.*) I think the Germans are the worst, they come away more to save conscription.

Mr. JAMES BROWN, called and examined.

Mr. James Brown.

22928. (*Mr. Smillie.*) You have had considerable experience as an underground worker?—Yes, 29 years.

22929. You are President of the Ayrshire Miners' Association, and have been for a number of years. I think you are now an agent or collector for the Ayrshire Miners' Association?—Yes.

22930. You worked continuously underground for 29 years?—Yes.

22931. Has your experience been confined to Ayrshire?—Except once or twice in Lanarkshire, once at Hamilton and once near Old Flemington.

22932. You have worked in other collieries outside?—Yes.

22933. You understand fairly well general mining as applied to Scotland?—I ought to.

22934. Do you know by sight all the mines inspectors for the West of Scotland, from seeing them inspecting the mines?—I never happen to see any in the mines except Mr. Mottram. I know the Chief Inspector.

22935. Mr. Ronaldson?—Yes.

22936. During that 29 years have you met Mr. Mottram or any other inspectors making inspections underground?—Only once that I remember.

22937. In the whole of your experience?—Yes.

22938. You have been a miner during the time of a considerable number of inspectors. There has been a considerable number of changes during those 29 years?—Yes.

22939. Mr. Ralph Moore at one time was Chief Inspector while you were underground, for many years?—Yes.

22940. Did you ever see him?—No.

22941. As a matter of fact you have only seen one inspector underground?—Yes.

22942. Are the collieries in Ayrshire better conducted? Are the ventilation and general conditions better than elsewhere?—I should not say they are.

22943. Do you think more frequent inspection is required?—Yes, certainly much more than I have been in the habit of seeing.

22944. Has inspection by Government inspectors tended to greater safety underground?—Yes.

22945. Do you know whether or not the mines managers are given notice of a proposed visit by the inspectors?—I have always considered so, because I never happened to know of an inspector being in the district except when an accident has happened.

22946. When an accident has happened they naturally know an inspector will be visiting?—Yes.

22947. Have you heard of visits by the inspector to the mines when considerable preparation has been made?—I have known that preparation was made after an accident. I never knew of another visit. There may have been one.

22948. You do not know of any surprise visits other than those where accidents have taken place?—No.

22949. You think that there might be considerable increase in the number of inspectors, and that there should be more surprise visits?—I think so.

22950. You have had a long experience of pit firemen?—Yes, I have worked under them all that time.

22951. You have known a considerable number from first to last?—Hundreds.

22952. Are they usually a fairly capable class of men?—Sometimes, but were I a manager I would not care to employ some of them.

22953. You do not think they are the very best class of men to be found in the mines?—Occasionally, but certainly not very often.

Digitized by Google

22954. Not as a rule?—Not as a rule.

22955. You have not very much explosive gas in Ayrshire?—Yes, in my own particular district.

22956. Annbank?—Ayr Colliery.

22957. It is worked with safety lights?—Mostly. Soft coal always.

22958. A fireman in a case of that kind would require to be a very competent person to look after the safety?—He ought to be.

22959. Have you had any explosion at Annbank Colliery?—We have had slight explosions. Nine years ago we had an explosion at Drumlee Pit, in which seven lives were lost—I should think about nine years in September.

22960. We have been told that the firemen in Ayrshire are not very well paid. They are paid 5s. 4d. to 6s. 6d. a day?—That is so. That is about the average. In the Colliery just now I think it is about 5s. 10d.

22961. You do not think that is a wage which would encourage the best class of men?—You cannot get them at the wage, generally speaking.

22962. You cannot get good men at that wage?—It is not to be expected.

22963. Do you consider a fireman a very important official about the colliery so far as safety is concerned?—Yes.

22964. Do you think that the best class of men should be chosen for work of that kind?—I do.

22965. You favour the holding of an examination and the granting of certificates of competency?—Yes.

22966. You think that everything should be done that can be done to prevent accidents at wheel braes, and arising from continuous haulage?—Yes.

22967. You think that something more than is done now might be done and might be made compulsory?—Quite easily.

22968. We had before us the question of runaway points to prevent accidents on braes, and a continuous chain over the top of a train of trams, so that if a breaking of a coupling or a draw bar takes place, it might prevent a runaway. You would favour those things being made compulsory by law?—Yes.

22969. Do you think it would lead to a lessening of the accidents arising from haulage?—It certainly would.

22970. Many of those accidents which take place now could be prevented if the appliances which we know of were made compulsory?—That is so.

22971. Most of those appliances might be provided at a trifling cost?—Very little.

22972. There is nothing that is proposed to prevent haulage accidents which would be prohibitive so far as the price is concerned?—No.

22973. Have you heard of accidents occurring to men sometimes in the night time or at other times during the day when they were working in an isolated position and no person near them?—I have known one or two accidents to the men at the coal face working singly. I have known other cases where a very serious accident might have happened to the man, only he escaped providentially one might say.

22974. You do not think it is a good thing that a workman should be working alone at night time, or in any isolated part of the pit? If an accident takes place which might not otherwise prove fatal, it may from the want of assistance?—Yes.

22975. In Scotland there have been a considerable number of men who have lost their lives who were proved afterwards to have lived a considerable time and died because they could not assist themselves?—Yes.

22976. Do you think it a wise precaution that two men should be employed together where they are isolated, or working in the night?—I think it should be compulsory.

22977. Dealing with the introduction of any new explosive here, as to whether a change of explosive should be brought to you, you say it is desirous that the workmen should have a voice in saying if there should be a change, and what explosive should be used?—It comes hard on the men who have changes sprung upon them, as I have seen at times.

22978. You will admit that the explosive which is proved by experts to be the safest possible explosive is the explosive which should be used?—Certainly.

22979. You would not allow anything to stand in the way of safety?—Certainly not.

22980. Do you think the explosives the men use are changed from time to time without their being in any way consulted about the matter?—That is so.

22981. It is not always beneficial?—I have thought so many a time as a practical miner.

22982. You advocate that there should be drinking water provided in the mine for the men?—Yes.

22983. It is the case that men often in our Scotch mines have to go all day unless they carry water with them. They cannot get water unless they run the risk of drinking water that should not be drunk?—Yes.

22984. You think it would not cost very much to put water in?—No.

22985. (*Mr. Ratcliffe Ellis.*) Upon the question of the inspectors, do you suggest that there should be an increased staff of Government inspectors?—Yes.

22986. What is your view as to how often a pit should be inspected by the Government inspector?—I have not thought carefully out as to how many inspections, but a great many more might be made than are made.

22987. Do you think once in every six months every pit should be examined?—I think six months would be rather a long period.

22988. They say at present in Scotland that they examine each pit once a year, at any rate six months is not often enough?—I think not.

22989. How often would you think?—At least once a quarter, I should think.

22990. Do you think it would be necessary to examine all the pits every quarter, or might some not be examined so frequently and some more frequently?—Of course an inspector knows his district and his pits, and some mines might be advantageously examined more often than others.

22991-3. Would you leave that to the inspector's judgment, as to how frequently he should examine?—It would depend upon the inspector.

22994. That is a little awkward to work out?—It might be, perhaps.

22995. Assuming an inspector was a competent man, give him credit for competency, would you leave it to him to say how frequently he should visit the pits in his district?—No, I think it ought to be compulsory that a visit should be paid at a stated interval, and not less than——

22996. Not less that once a quarter?—Yes.

22997. What do you mean by a "visit"? Do you mean he should go through the whole of the mine, all the working parts?—Why not.

22998. I am asking you. I do not want you to ask me questions. When you say he should visit it do you mean that he should go through the whole of the working places of the mine?—I think he ought.

22999. You are actually engaged in mining now?—No. I have not been at the coal face for about three years.

23000. When you did work what were the number of men employed underground in the mine where you worked?—The last pit I worked in there were about 250.

23001. That is not a very large place?—One of the largest in Ayrshire.

23002. How long would it take one man to make such an inspection as you consider ought to be made of the whole of the working places in the mine, and the whole of the mine where inspection ought to be made?—He might do it, if he cared to work long enough, in one day, or a day and a half.

23003. What distance would he have to travel?—It would depend upon the age of the mine.

23004. In the mine you worked in?—Do you mean the whole of the area of the mine?

23005. What you say ought to be inspected. What would satisfy you?—Taking everything into account, perhaps about 2 miles or 2½ miles to cover everything.

23006. That would cover everything?—I could not swear to that.

23007. Do you think about 2 or 2½ miles would cover the whole?—Yes.

Digitized by Google

Mr. James Brown.

13 June 1907

23008. Would that cover all the travelling roads, the airways and working places?—It would, nearly. I am thinking more particularly of the mine I worked last at.

23009. I am speaking of that. What distance is the furthest place from the shaft?—So far as I remember, about 800 or 900 yards at that time.

23010. That is getting on for over half a mile. That is one road, and that is the main road?—Yes.

23011. What area of faces have you open?—The area is not large. There are two or three sections worked.

23012. Do you think that you are right in saying 2½ miles?—I would not swear to that, as I have told you.

23013. It might be double that?—I do not think it would be double, but it might be considerably more.

23014. How many firemen are employed there?—There are four firemen.

23015. For the whole pit?—Yes. Excuse me, there were seven firemen; four firemen for one seam, and three for the other.

23016. The whole of the pit is only 2½ miles to travel?—I do not say it is only 2½ miles; it might be considerably over. I would not like to say.

23017. I am talking of the time when seven firemen were employed?—Yes.

23018. I want to know the distance these seven firemen had to go. If 2½ miles would take them all over the place.

23019. (*Mr. Enoch Edwards.*) Had you both seams in your mind when you said 2½ miles?—I was thinking of one seam.

23020. (*Mr. Ratcliffe Ellis.*) I want to know at the colliery at which you were working the length of time it would take an inspector or a person making an inspection of an extent as you say ought to be made to make that inspection?—It is not difficult to count up when you know the time each firemen takes. It is not difficult to multiply that by four, and then you would find out the time.

23021. Do you still think that one day or a day and a half would enable you to make the inspection of the pit?—I should think so. I should not be afraid to do it.

23022. What do you suppose you would gain in safety by these more frequent inspections—these periodical inspections by an inspector?—I should say if an inspector was there he would see when any infringement of the Coal Mines Regulation Act was taking place on the part of the officials.

23023. He could only see that when he was there?—Yes.

23024. That would not be much use?—There is not likely to be an infringement under the nose of the inspectors?—If he came unexpectedly he would see it.

23025. I am speaking of periodical visits?—Well.

23026. Do you not think if you saw the condition of a mine to-day and the condition of its management, whether it was slack or good management, that it would give you an idea of the condition of the mine?—Yes, I do.

23027. An inspector or you yourself, if you went down over part of a pit and saw it was satisfactory and smart, would conclude that was satisfactory and take that as a sample?—Not on the first visit—perhaps after once or twice.

23028. The inspectors know their pits?—Yes.

23029. Knowing the pits, having been down before and seen the condition at one part, it would give you an idea as to what the whole of it was like?—It might.

23030. Do you suggest that the firemen should not be discharged by the manager?—I do.

23031. You would not extend that protection to the manager—you would allow the owner to discharge the manager?—I should think I would.

23032. And under-manager?—Yes.

23033. But the fireman is not to be discharged?—No.

23034. When he is once appointed he is practically appointed to that pit for life, unless he wants to go away?—Not necessarily.

23035. How would you get rid of him?—If he was infringing any bye-laws of the Act he might be got rid of in that way.

23036. Supposing the manager thought he was unsuitable for the job, how would you enable the manager to get rid of him?—I would not give him that power.

23037. If the fireman is an unsuitable man how can the manager get rid of him?—A manager might, if he were unsuitable and gave him trouble.

23038. Supposing, rightly or wrongly, he thought so, how do you suggest that he should be able to get rid of him?—I should not suggest that he should be able to get rid of him at all.

23039. He cannot get rid of him?—The manager could not.

23040. How can he be got rid of?—Unless he gave proof that he was.

23041. Who must the manager give proof to?—Make him a Government official.

23042. Supposing he is not a Government official, but appointed by the manager, and the manager wants to get rid of him, you say he must prove that he is an unsuitable man?—Yes.

23043. Who is he to prove it to?—I do not think it would be difficult to have some Court of Arbitration to take it to.

23044. Would you establish a new court, or is there any court in existence?—I do not think there is any.

23045. You want a new Court of Arbitration to try whether a fireman was fit for his work before he could be discharged?—Nothing elaborate; something that the manager would be able to say, "Here is an incompetent fellow."

23046. I want to know rather more about it. Who would, in your view, appoint the arbitrator; would they each appoint a man, the manager and the fireman, and the two appoint an umpire?—How would it be for the chief inspector along with one or two others?

23047. Have you not thought this question out at all as to how you would carry out your scheme?—I have not given it a great deal of thought. It looks to me as if it could be quite easily done.

23048. If you prevent the manager getting rid of a fireman that he considers incompetent, would you relieve the manager from the responsibility of any accident which happened in consequence of that incompetency?—I would not prevent the manager altogether, but he should be able to prove something against the fireman before getting rid of him.

23049. Supposing there is a difference of opinion between the fireman and the manager, and in the interval before the time the Court of Arbitration deciding that this man is to go away an accident happens in consequence of this man's incompetency or negligence, would you relieve the manager from the consequence of that accident?—You would have to relieve him if you took away the power.

23050. Do you think it would conduce to safety to relieve the manager from the responsibility of the safety of the pit?—I do not understand the question.

23051. Your scheme would necessarily relieve the manager from responsibility because you prevent him having control over his officials. You recognise also that it would be reasonable in that case?—I did not say altogether that the manager should be relieved from the full responsibility.

23052. If you prevent the manager appointing his own people and discharging them and appointing others——?—I mean, indiscriminately.

23053. If you say he is not entitled to do that, is it not right that you should relieve him from the consequences of these people's mistakes?—Yes.

23054. Do you think that it would be conducive to safety that you should relieve the responsible manager from the consequences of a violation of the law by a man he appointed, but whom he could not discharge, who was proved to be incompetent?—I really do not follow you.

23055. Would that be conducive to safety, to make that alteration?—I do not follow you. I do not know what you want to be at.

23056. Never mind what I want to be at. Will you answer my question. You will see what we want to be at after we get it down. At the present time the manager of a mine is responsible?—Yes.

23057. If he appoints an incompetent person he is responsible?—Yes.

Digitized by Google

23058. If you prevent him getting rid of an incompetent person you ought not still to hold him responsible. That is true?—Yes.

23059. Now I ask you if you consider such a change would be conducive to safety by relieving the manager from the responsibility put on him by the Act?—I think it would.

23060. I did not follow about no person being allowed to work alone. The fireman is alone in working his rounds?—Yes.

23061. Would you have someone going with him?—No.

23062. Why not? If anything happens to him who is to look after him?—It is a different thing making an inspection alone.

23063. Supposing anything happened to the fireman, there is nobody to assist him?—That is true.

23064. Would you have two men?—No.

23065. What class of labour is it you would not allow to work alone?—I would not allow a face man to work alone.

23066. Is it usual for a face man to work alone?—Yes.

23067. Has not he a drawer?—The drawer is very seldom there.

23068. He is with him except when taking the coal to the shunt?—That occupies most part of the day.

23069. If a man was getting coal, a man and his drawer, would you require another man in the place on the chance of something happening to the collier, and also a man with the drawer going to the shunt?—I would have a man at the face, but not a man with the drawer.

23070. An accident might happen to him?—There are many drawers on the way.

23071. Are there not many men in the face?—Working stoop and room they are sometimes a considerable distance off.

23072. How far away would you have the man looking after the collier at the face?—I think they ought to be working double at the coal face.

23073. Is that a new system altogether?—No.

23074. There should be no working at the coal face unless there were two sets of men?—Two individual men, I mean.

23075. There are two men, the collier and the drawer. You think that a working man should not be alone at the face?—I do.

23076. If it is one man's job do you suggest that there should be two men there?—No, one to work alongside with him.

23077. With regard to the explosives, you say you think the men ought to have a voice in the explosives used?—Prior to the introduction of new explosives.

23078. Are you speaking now of high explosives?—Yes.

23079. You know that there is an Explosives Order in which those which are considered to be safe after very careful tests are put down in the list?—Yes.

23080. Some are more expensive than others?—Yes.

23081. There are different opinions as to whether one is better than another in the way it does its work?—Yes.

23082. If the explosive is not safe it is not put on that list?—No.

23083. If it is safe then it is put on the list, after being tested by some exceptionally able men?—Yes.

23084. Why should not a coalowner and employer have the right to select any of those explosives which he thinks fit, after being specified as safe?—There is no reason that he should not, but an indication ought to be given to the men or their representatives, so that they also might have a voice. As practical men they know the explosive that blasts a certain seam better than others.

23085. Do you propose that they should be entitled to prohibit any explosive being used?—No, I do not.

23086. What is the object of intimating to the representatives of the men the explosive you intend to use if they are not to have an opportunity—— ?—You mean individual explosive?

23087. Yes?—I think in some cases a less expensive explosive might be used.

23088. Where the collier has to pay for his explosive you want the cheapest explosive?—No.

23089. You say a less expensive explosive?—A more suitable explosive for the seam worked at.

23090. Did you not say a less expensive?—It might be, and more suitable also.

23091. As to the suitability of the explosive, is not that a question for the management? It must be a safe explosive if on the permitted list. Why should not the manager have sole discretion as to which of these explosives he would use?—Because men working with explosives sometimes know far better than a manager what is suitable for a seam.

23092. With reference to the explosive, the seam may be worked better with it, and you may get more round coal. There are various grounds upon which a manager might select one explosive. Why should not he have that right?—Because he does not know as well as the men.

23093. Should he not have an explosive the men did not approve?—I think there should be a conference.

23094. Supposing the manager is entitled to have the explosive, what is the use of discussing it with the men? You do not say that he should not be entitled to use the explosive except with the sanction of the men?—No.

23095. If he is entitled to use it whether the men like it or not, what is the use of discussing it with the men whether he shall use it or not?—I am thinking about the explosives the men use themselves in getting coal.

23096. Do you want them to select their own?—No, but I want them to be able to have a voice before the introduction of any new explosive.

23097. What voice do you mean? It is one thing to say a new explosive shall not be introduced without the sanction of the men?—Yes.

23098. You do not go so far as that? If the manager is to have the responsibility of selecting them, what use is it discussing it with the men?—If the manager is to have the responsibility.

23099. He cannot escape the responsibility, and you would not prevent him doing it. It leaves to him the right to introduce the explosive?—Yes, but the men might be able to point out that it would be better for him and them all.

23100. They can now?—It is not compulsory in the meantime.

23101. Would you make it compulsory?—That at least a conference should be held.

23102. What is the use of a conference; the owner is responsible, and he has a number of explosives certified as being safe. You do not say he should not be entitled to select one without the sanction of the men, but that before he selects it he ought to consult the men. Why?—To arrive at the best explosive suitable for the mine being worked.

23103. The manager of the mine considers that he is competent to do that himself?—But he is not always.

23104. Is it not usual for the men to take drinking water down with them?—It is very common.

23105. Do you want to stop that?—No, but I want to provide a little water for men who cannot get it otherwise.

23106. Have you made any calculation as to what it would cost?—No, but I am sure it would be very inconsiderable.

23107. You want to supply pipes in various parts of the mine. At some of these collieries there are a thousand men underground, and the workings are very considerable?—Yes.

23108. Would you pipe the whole of these workings?—The pipes could be taken in the main roadways and to a suitable centre where the men could get at them.

23109. You have no idea of what the cost would be of putting in and maintaining pipes and supplying water?—I am always thinking of our own mines. I am under a disadvantage.

23110. In your mines it would not be expensive?—No.

23111. You could not say what the expense would be in a large colliery?—No.

23112. (*Dr. Haldane.*) Do you propose to take water to the working face?—No.

23113. Where do you propose to take it to?—To lyes where the men are in the habit of coming.

Digitized by Google

Mr. James Brown.

13 June 1907

23114. These are usually for the working face. They might be a long way from the pit bottom?—It would be a considerable distance from the pit bottom; it would be to obviate the disadvantages of going there.

23115. Some of the suggestions we have had from the previous witnesses seem to me rather to throw doubts on the competency of the managers?—Yes.

23116. Do you think that the qualifications of managers in Scotland, so far as your experience goes, are insufficient?—If I were an employer I would not employ some of them, they have very little experience.

23117. You think that the qualifications of some of them are insufficient?—I do.

23118. Do you think that the examination does not give sufficient guarantee of their competence?—I do not think so in every case.

23119. On this question of explosives you said that the managers often did not know?—I have said they did not know so well as a man who has been working 20 or 30 years might know.

23120. It is the business of a manager to know and find out and get what evidence he can —Yes.

23121. A competent manager would do that?—Yes, very likely he would.

23122. I suppose it means some managers have not had sufficient practical experience of explosives, they do not know enough about them?—They might have had their experience in a different mine to the one in which they were working at that time, and there is a very material difference in the mode of blasting coals.

23123. Do you know any mines where water is provided by the management by pipes?—No.

23124. Have you ever heard of such a thing?—No.

23125. I only know one in Cornwall. So far as my experience goes the miners always provide their own drink—water or tea?—It is usual. It is very hot in deep workings.

23126. So would the water be through the pipe?—It would not deteriorate so quickly as in an open can.

23127. I think it would more quickly myself. However, that is one difficulty. It is a simple solution of the difficulty for the miner to take what he wants, and I think it is the usual solution. It would not meet your point unless the water was carried to the working face?—To the lyes.

23128. That is near the working face?—Sometimes they are a considerable distance off.

23129. Still, it would not meet your point to bring it only to the bottom?—I would like it further in, because thirsty men drink water very unsuitable for them.

23130. That is very bad, but I think they ought to take sufficient water for the day with them, or have it carried in. Have they any means of keeping the water cool; do men do anything to keep the water cool that they take in?—Nothing that I know of—they put a little oatmeal in it.

23131. That will not keep it cool, they have no kind of vessels that will keep the water cool by evaporation?—No.

23132. They could do that usually in a colliery in the same sort of way they do in Egypt. I want to know about ventilation in your part. I do not think you have said anything about that?—No.

23133. Do you think the ventilation is fairly satisfactory as a rule in Ayrshire?—I have heard many complaints. I cannot complain of my own particular colliery—it is fair.

23134. The colliery you know best had a good deal of gas in it?—Yes, that pit at least.

23135. For that reason it would be necessary to have good ventilation?—Yes.

23136. Have you heard complaints of black damp?—I have worked in black damp.

23137. Do you find it unpleasant to work in?—I do, surely.

23138. In what way?—For one thing, nobody would dare to say it was not inimical to health, and there was always drowsiness if one worked where black damp was near. It always knocked one off his feet.

23139. It did?—As a rule.

23140. Did it affect the burning of the lamps?—Yes.

23141. Did it ever give you a headache?—Yes, after a day or two. I have vomited after it, too.

23142. Are you sure that was just black damp and not gases from powder?—No, it was black damp.

23143. Or heating of the mine?—Black damp was the principal thing that caused it.

23144. Did it make you short of breath at the time you were working? Did you ever notice that?—I cannot say I did personally, but I have heard men complain it did.

23145. I mean, at the time of working, did it make it necessary for you to take a deeper breath than usual?—I suppose that would be usually the case among black damp.

23146. That is the effect it had on me. Anyhow, you are of opinion that that ventilation is not altogether satisfactory at present in some mines?—I am. In any mine, indeed, you come to working places where it is very bad. That is, perhaps, driving a place to get through for air. The men have to put up with very much.

23147. Chiefly black damp?—No.

23148. Fire damp?—Simply lack of ventilation and powder smoke. Black damp is usually confined to workings that have been stooping for a time.

23149. Have you ever considered the question of the desirability of providing means for changing pit clothes and washing at the pit head?—I have looked at it as an ideal, which it is very desirable to be obtained.

23150. What is the feeling of the miners in your district on that subject? Has it ever been considered?—No; I think the men ought to be educated up to it.

23151. You are of opinion that it is desirable?—Yes.

23152. Does it cause much inconvenience at home when the men come home in their dirty pit clothes?—It causes a considerable amount of inconvenience which varies according to the nature of the dwelling-house.

23153. Are there many one-roomed miners' houses left in your district?—Yes.

23154. There are some?—75 per cent. of them are one-roomed, except the buildings that have gone up lately.

23155. Would you estimate it at 75 per cent.?—In the village of Annbank 75 per cent. of them are single dwellings.

23156. (*Mr. Smillie.*) That is the village you have lived in?—Yes.

23157. (*Dr. Haldane.*) Who built those houses?—They were built about 50 years ago by contract.

23158. Are there no other houses which are available?—Excepting a considerable distance out, but there are very few. I should say that over an area of 5 miles there are not two spare houses available outside the colliery houses.

23159. You mean outside these one-roomed houses?—Yes; in the village there are several at the ends of blocks, but over 75 per cent. are single houses, or were until quite recently.

23160. That is to say, they are houses with one room in them?—Yes, kitchen or whatever you call it.

23161. I suppose it is a good big room, but there is no means of dividing it up?—You could not very well divide it up. There is a little change coming over them—they have been built lately a little better.

23162. The pit clothes have to be dried in that room?—Everything has to be done there.

23163. Any washing has to be done there?—Now, in my district wash-houses are provided outside, but until 12 years ago everything had to be done there.

23164. I mean when the man comes home?—He must wash there.

23165. That is the only place he has?—Yes.

23166. (*Mr. Enoch Edwards.*) First of all, with regard to the question of explosives which Mr. Ellis has been asking you about. Generally Ayrshire is not a gassy coalfield?—No, but as they are going deeper it is becoming so.

23167. You largely use naked lights?—Yes.

23168. We have had it in evidence this week?—That is so usually in Ayrshire.

23169. When you were expressing your opinion to Mr. Ellis on the question of explosives, and the work-

Digitized by Google

men's right to have some say in the matter, had you in mind explosives used in pits where naked lights are used ?—Yes.

23170. That is to say, it is a question in the opinion of the men as to which type of explosive gets the best coal ?—Yes.

23171. It is only on those grounds ?—Yes.

23172. If you have a very fiery mine and it is a question of putting an explosive in—one of the permitted explosives—you do not suggest that the men should have a right ?—No, I had in mind where the men were put to unnecessary expense where there was no gas.

23173. The men of Ayrshire were never unreasonable if it was going to incur greater risks to the men ?—No.

23174. It is only where gunpowder may be used with naked lights, and it is in these cases that you think the men should have some voice in the matter ?—Yes.

23175. Have you had much experience of the men being fined for a breach of the rules ?—Yes. Do you mean taken to court ?

23176. No, fined in the colliery office ?—There were one or two within a year or two, but they are largely taken to court now. We have no system of local fining.

23177. I may take it that harmonises with the views of the men ?—Yes.

23178. They deprecate fines in the colliery office ?—Yes.

23179. It is not practised much in Ayrshire ?—I do not think so; it is not in my own particular district.

23180. In your judgment would it be wise to abolish it altogether ?—I think it would.

23181. Do you think that discipline should be maintained by taking men to the court where the charge could be made rather by fining in the colliery office ?—Yes.

23182. (*Chairman.*) On the question of explosives I think we understand the position. The explosives you were talking about are used in naked-light collieries ?—Yes; may I explain this. I have seen bobbinite introduced where gunpowder could have been used because of the perfect safety of the mine. That is what I am thinking about.

23183. Still, the responsibility remains on the manager. The men and the manager may differ as to whether or not one explosive may be cheaper and may be a little more dangerous than another, but if anything happens the responsibility is always on the manager ?—Yes.

23184. It is not on the workman. He should have a good deal to say with regard to what explosives should be used. Do you not think so ?—Yes, but still I think there ought to be consultation where a mine is perfectly safe, in any event.

23185. We know that naked-light collieries are much safer than safety-lamp collieries. I think Mr. Smillie has told us that you cannot always be certain because a colliery is worked with naked lights that you will never get an outbreak of gas ?—Neither you can, especially with stooping places; it may come at any time.

23186. I do not think it comes under this inquiry, but this occurs to one with regard to these one-roomed houses you speak about. Is there any public authority that takes any note of overcrowding ?—I never heard of any steps being taken by any authorities. Of course there are authorities we might apply to: we might apply to the County Council, or the County Medical Inspector, but I have never known of anything being done in that way.

23187. The houses which are being built now are better ?—They are all two-roomed houses.

23188. (*Mr. Smillie.*) What population has the village of Annbank ?—1,200 to 1,300.

23189. Would there be six wash-baths in that village —places where the men could wash ?—There is not one.

23190. You do not think there is one in that village ? —I am sure there is not one, except it is a portable one.

23191. There is no opportunity of a miner getting washed all over his body unless he does it in his house ? —Or goes to the river.

23192. Dr. Haldane said that the single apartment was pretty large; 14 ft. square is the largest, I think ?—Not much over that—perhaps a little; they are two-bedded rooms.

23193. They are 14 ft. square, and there are, say, two beds 6 ft. long each and 4 ft. wide ?—Yes.

23194. That is taken off 14 ft. of space ?—Yes.

23195. It is not an uncommon thing to have a man and his wife and five children in one of those single apartments ?—That is very common.

23196. It is not an uncommon thing for a man and his two sons and his wife and other little ones to be even in a single apartment ?—I have known of cases, but our employer there tries to obviate that as much as possible —that is to say, he takes regard to the number of the family, and tries to give double houses to the men.

23197. (*Dr. Haldane.*) Is there a county Medical Officer of Health ?—Yes, Dr. Macdonald.

23198. (*Mr. Smillie.*) Supposing attention was called to the fact that a family of seven persons, man and wife and five children, were living in a single apartment, and the medical officer visited there, he would not find fault ? He has no right or power to find fault ?—I do not think so.

23199. It is a common thing for families of that kind to be in single apartments ?—Yes, it is a common thing.

23200. The manager or the owner endeavours to arrange, when the family comes to be working young men, to give them the double ends as we call them ?—Yes, and they go further than that where the lease of the estate allows it, and they give him extra rooms. The owner cannot do everything, because he has not the room to do it.

23201. On the question of baths there is not a strong feeling among the miners just now, but you say that they should be educated up to it ?—Yes.

23202. Do you think it would be in the interests of health that they should be clean and be able to wash at the pit ?—Surely it would.

23203. It cannot be good for their health to have two or three suits of pit clothes drying round the fire where the people are breathing the fumes ?—It cannot.

23204. That is the case where there are two even in the kitchen ?—Yes.

23205. Do you think that it would not be a great expense to provide drying and bathing accommodation at the pits ?—I think it would not.

23206. Do you think the miners would seriously object if they were required to pay a small tax even to assist it being done ?—I do not think they would.

23207. Do you think it would be such an alteration that the miners' wives would universally thank Parliament if it were passed into law ?—I think they certainly would.

23208. They are the greatest sufferers ?—Yes.

23209. (*Chairman.*) With regard to these baths, how many baths do you think would be necessary ? In some pits where there are many men, a shift would consist possibly of hundreds of men coming very quickly after one another ?—Yes.

23210. 200 or 300 perhaps ?—Yes.

23211. How would you provide bathing accommodation for 200 or 300 men at once, or within a reasonable time ?—You could provide a sufficient number of baths.

23212. That would mean you must have as many as 200 baths in some pits ?—It might mean that, but the sanitary authorities might be the ones to say the number of baths.

(*Chairman.*) Providing 200 baths would be rather a considerable business at the pit mouth, or anywhere close.

(*Dr. Haldane.*) What are wanted are shower baths. It is done with shifts of over 1,000 men. I have seen it at various mines.

23213. (*Chairman.*) There must be 1,000 separate baths ?—No.

(*Dr. Haldane.*) They go into the place as they come up in the cages, and they are done in a very short time. Warm water is always running.

(*Chairman.*) How many would be in a cage —16 ?

(*Mr. Smillie.*) 4 to 16.

(*Chairman.*) How quickly do the cages come up ?

(*Dr. Haldane.*) There are a lot of men in the place at one time.

Digitized by Google

Mr. James Brown

13 June 1907

(*Chairman.*) Is there any serious complaint where 1,000 men go through the baths one after another of their having to wait a long time?

(*Dr. Haldane.*) No, they have very little waiting. Each man is actually under the shower for a very short time.

(*Chairman.*) Directly he is out he goes and dries elsewhere?

(*Dr. Haldane.*) He comes out and gets his clothes.

23214. (*Chairman.*) With regard to the qualifications of managers, you say you think it is insufficient. I mean that the examination is insufficient. Have you any suggestion to make as to the examination? Do you think that it ought to be a more practical examination?—I did not say that qualifications of all managers was insufficient. I said that some were.

23215. You said that the qualification of managers was insufficient?—Some only.

23216. A man may become a manager without having sufficient qualifications?—I said that some managers, in my opinion, were not qualified as they ought to be.

23217-20. That is to say, a man is capable of becoming a manager, and does become a manager, although, in your opinion, he is not competent to become a manager?—Yes.

23221. We have it in evidence that a man has been considered to comply with the requisition as to practical experience if he has worked as a surveyor?—Yes.

23222. You think that would be wrong?—I do.

23223. You consider that the statutory qualification for a manager before he can sit for an examination ought to be made stricter, and that the five years' experience which is required should be a practical experience underground?—Yes.

23224-5. And that he should have been underground himself, that his occupation must have taken him underground for a large portion of that five years?—I say so. I understood that was the practice in Scotland just now.

23226. Is there anything more you would like to say to the Commission?—No, except on the question of managers. I think that a manager ought to have more practical experience, but a man might have 20 years' experience, and be able to take a certificate, and not be a very competent manager after all.

Mr. WILLIAM ADAMSON, called and examined.

Mr. William Adamson.

23227. (*Mr. Smillie.*) You are Assistant Secretary of the Fife and Kinross Miners' Association?—Yes.

23228. You have had a considerable number of years' practical experience as an underground worker?—27 years.

23229. In practically all classes of mining work?—Yes.

23230. You understand fully mining so far as Fife is concerned?—Yes.

23231. Mining is extending very rapidly in Fife?—Yes.

23232. There are likely to be greater developments in the future?—Yes.

23233. You have nearly 20,000 persons employed in and about the mines?—Fully 20,000.

23234. The developments which are taking place now are chiefly in strata which are lower-lying than it has been usual to work in the past?—Yes.

23235. You are going deeper for the coal?—Yes, very much.

23236. Some of the new collieries give off a considerable quantity of gas?—Yes.

23237. You were comparatively free up to recent years?—Up to within a few years.

23238. We may take it from you that the development of those new collieries under what may be looked upon as more dangerous circumstances will require greater care than may have been used in the past?—Yes.

23239. And wider experience, so far as the management of the mine is concerned?—Yes.

23240. Because of new dangers?—And I think, in fact, the whole of the officials.

23241. Do you think there may have been men holding the very important position of firemen in the collieries in Fife in the past who would not be qualified to hold the same position under the newer conditions unless they had some previous experience?—I think there are men now.

23242. Holding the position of firemen?—Yes, in Fifeshire—who would not be suitable for holding that position in some of the mines that have been developed lately.

23243. How long is it since you left the pit?—Four years.

23244. You were working up to four years ago?—Yes.

23245. Do you know whether or not the present system of inspection by Government inspectors is considered effective so far as the thorough examination of the mine is concerned?—I do not think it is at all adequate.

23246. Have you seen any general inspections of the mine in which you were employed carried out during your 27 years' experience?—I only saw the Government inspectors twice underground during my 27 years experience, and they had been sent for specially on both occasions.

23247. Because of a complaint?—Because of a complaint as to the state of the ventilation.

23248. You do not complain that they do not pay attention to any complaints made?—No.

23249. They are very attentive but they do not perhaps make a thorough examination of all the mines under their charge?—In my opinion it is absolutely impossible for the number of men at present.

23250. It is not done now we may take it?—No.

23251. Do you think that there should be a thorough examination of the mines made periodically?—Decidedly.

23252. Would you say once every three or four months would be sufficient?—I should say it should be done at least twice every year.

23253. That is a thorough examination of each mine?—Yes.

23254. In addition to that, there should be surprise, visits made where the inspector has any reason to believe that the Coal Mines Regulation Act is not being carried out?—Yes.

23255. Are you aware that that would make a considerable addition to the number of inspectors?—Yes.

23256. Are you favourable to the creation of a new class of assistant inspectors, or would you merely increase the number of the present class of inspectors?—I think that in making any additional appointments it would tend to greater efficiency in inspection if more regard was had to practical experience.

23257. At the face or underground?—In all classes of underground work.

23258. Practical experience should be one of the qualifications necessary?—Yes.

23259. Would you propose, in setting up a class of inspectors, that one of the qualifications for holding certificates should be that they had been practical men?—Yes.

23260. Would they be a lower paid class of inspectors, or would you make them the same class as the present assistants?—I think I would make them the same class as the present assistants.

23261. Would you increase the present number of chief inspectors or make their district smaller? Are not their districts pretty wide at the present time?—I think the one for the East of Scotland covers 23 counties.

23262. If he is doing very much examination he must be a considerable time on his journey to and from the places?—Yes.

23263. Do you think that it would be better if the districts were smaller and there were a chief for each of the districts?—Yes.

Digitized by Google

23264. I suppose Fife would be large enough to be covered by a chief and some assistants to do it in the way you want it to be done?—If done in the way I would suggest there would be one Government inspector for every 10,000 persons employed, which would mean that we should have at least two inspectors resident in Fifeshire.

23265. Do you think if there were two inspectors resident in Fifeshire, responsible for the examination of the Fife collieries, that it would be physically possible for them, supposing they devoted their whole time to it, to make an examination of all the collieries in Fifeshire twice a year?—The examination they could make under circumstances such as that would be very much superior to what is in practice now.

23266. It would be better than the present?—Yes, very much better.

23267. I am afraid it would not enable them to make the examinations which you want made. With regard to the inspection under Rule 38, you are aware that the men have a right to appoint two persons who are practical miners to make an inspection. The only alteration you think that is necessary in this rule is "are or have been practical miners"?—Yes.

23268. You want the men to have the right to appoint people who have been practical working miners, and who at the moment are not employed?—Yes.

23269. You think that that would tend to this rule being more largely taken advantage of?—Yes.

23270. And would make the rule more effective. The men could appoint men who would be independent of the employer, such as the check-weighers?—Or the Miners' Union officials.

23271. Whether or not the fear is well founded, there is a fear at the present time on the part of the workmen if they make this examination and give an adverse report that they will be unfairly treated?—Yes.

23272. It would be very difficult to prove that there is anything in that?—It would be very difficult, although I have no hesitation in saying that the fear exists and is the chief cause why it is not taken advantage of.

23273. Do you think that there should be any change in the position of the colliery firemen, and that they should hold certificates of competency?—Yes, I think they should.

23274. Do you think that the best class of man is elected at the present time for those positions?—No.

23275. What wages do they pay the firemen in Fifeshire?—There are various wages paid. Within my knowledge they are being paid from as low as 5s. 3½d. per shift to 6s. 9d. per shift.

23276. Are they likely to get a good, competent, intelligent man for 5s. 3½d. per shift?—It is absurd to expect it, when the average wage in the county is somewhere in the region of 7s. a day for facemen.

23277. (*Mr. Enoch Edwards.*) Do those figures include your percentages?—Yes.

23278. (*Mr. Smillie.*) We may take it that there are some excellent men employed as firemen in Fife?—Yes.

23279. It would be an additional security for a good man if there was an examination for competency and certificates granted?—Yes.

23280. It would not be a hardship on the employers other than it might force them to pay a higher wage than at present?—Undoubtedly it would make for efficiency.

23281. Even in the interests of the employers themselves, an efficient man might be of greater service than a non-efficient man?—Yes.

23282. Do you consider that the fireman is the most important official about the colliery so far as the safety of the mine is concerned?—Yes.

23283. Is there any complaint from the employers or the mines inspectors so far as your county is concerned as to want of discipline amongst the workmen? Are they a wild class of people?—No.

23284. You have no foreigners down there?—We have a few.

23285. Not very many?—Very few.

23286. How is it possible that you can have discipline in your pits if you have a large number of foreign workmen who are not amenable to discipline? Is the Fife miner amenable to discipline?—Yes, but I cannot see how the foreign workmen can be amenable to discipline when they have not a knowledge of the English language.

23287. You have not many, and you do not know?—Any we have know a sufficient amount of English to make themselves understood.

23288. They have probably drifted from Lanarkshire into your direction?—Possibly.

23289. Have you many prosecutions for breaches of the Special Rules or Coal Mines Regulation Act?—We have had a few within recent times: more than used to obtain within the last two or three years.

23290. As your mines develop and become more dangerous it will be more necessary to them because there are more rules to observe?—Yes.

23291. You do not object to prosecutions where miners have been guilty of a serious breach of the Coal Mines Regulation Act?—No.

23292. Your union does not defend persons charged with a breach of the Coal Mines Regulation Act?—No, unless we have good reason for believing that the parties charged have not been guilty of an alleged breach of rule.

23293. You never think of defending a person whom you thought was guilty?—No, the very opposite, we have advised them to go and plead guilty.

23294. Do you do your best as an official of a trade union to encourage the men to carry out the rules provided for their safety?—Yes.

23295. Do you think it would improve discipline to have a system of fines established so that workmen might be fined 1s., 5s., or £1 by arrangement with the manager rather than be prosecuted?—I am entirely against that—I mean against the employer having any such power. I do not think that would lead to efficiency or in any way create an enforcement of discipline.

23296. Do you think that prosecution where an offence has been committed is the most effective way of preventing such a thing taking place again?—Yes.

23297. What do you mean by a systematic method of timbering being rigidly enforced by competent men? Do you mean that the men at the face should be compelled to timber in a certain way, or that the employer should employ some person to do the timbering?—An effective system of timbering could be done in either of the two ways that you have suggested, but personally I think that the men at the working face should do the timbering, and that the working face should be in charge of an experienced miner.

23298. And be under the supervision of a competent person whose duty it was to see that it was done. Have you any particular systematic method of timbering which you would suggest, such as putting up props at a certain distance, 2 ft., 3 ft., or 4 ft. from each other. Is there any other method of timbering you can suggest which would prevent accidents from falls?—Where the men are digging the coal?

23299. Yes, either longwall or stoop and room.—Where the men are cutting the coal with a pick I would suggest that the system that should be adopted there would be in accordance with that provided for in the additional Special Rules. Where the coal is being cut by machinery, I mean by a coal cutter, I would suggest that a special method should be adopted there, that method being straps with a hole needled in the coal and one end put there and a prop on the other end. When the machine had cut the line of face there could be a second prop put on the in-end of the strap. This is what I would look upon as an effective system of timbering where the coal is cut by machinery.

23300. There has been a large development in coal-cutting machinery in Scottish mines?—Yes.

23301. Does that apply to Fife too?—Yes.

23302. Is it likely to be much greater in the future?—It is likely to be greater in the future.

23303. So that our accidents from falls at the coal face will in the future be largely accidents at machine wall faces?—Yes.

23304. Have you experience of machine-cutting yourself?—No, I have no personal experience.

23305. Have you been at the coal face when the machine was cutting?—I have been there and examined the machine, and the face, and the operations.

Digitized by Google

Mr. William Adamson.

13 June 1907

23306. Are you aware that they cannot hear the roof working. Supposing it is dangerous you cannot hear any sounds of roof working where the machine is cutting?—That is why I propose this special method of timbering.

23307. You think, in order to prevent accidents at the face, that method would require to be adopted?—It is absolutely necessary if safety is to be preserved.

23308. At the face where men are cutting and getting coal do you think the present system of having a prop according to the rule——?—At such distances as the management thinks fit, and is provided for in the additional special rules.

23309. That might be done by the men themselves?—Yes, in fact I favour the men themselves doing it.

23310. They are supposed to do it, but they do not always do it at the present time?—They are supposed to do it at the present time.

23311. As a matter of fact do you know that it is not always done?—Yes.

23312. Many accidents arise from it not being done?—Some accidents, at least.

23313. I think you fear that the number of accidents will increase at the machine walls in future as the development goes on?—Yes.

23314. This method which you propose seems to be effective and should be compulsory?—Yes.

23315. A strap should be put across?—Yes.

23316. Over 4 ft. or 3 ft.?—I should leave a power in the hands of the management to fix the distances that they considered necessary. Just as in the other case where the coal is being got by the men with a pick.

23317. One end of the strap would be over the coal, and the other end would be supported by a prop before the machine came along?—One end of it would be needled into the coal and the other end supported by a prop.

23318. And when the machine passed you would put another prop to the inside end, because the coal would be coming down?—Yes.

23319. That would be your method of protecting the workmen at machine walls?—Yes.

23320. (*Mr. Enoch Edwards.*) By machine cutting do you mean holing under?—Yes.

23321. You are not cutting the face but holing?—Yes.

23322. (*Mr. Smillie.*) Some of the machines undercut to the extent of 3 ft. in?—Some, generally 4 ft.

23323. The cuts are 3 to 6 ft.?—Yes, in addition to that I would suggest that the inspection districts under the charge of firemen should be made very much smaller than they are at present, so that the firemen could have a closer supervision of the men and compel the propping to be done in a more efficient way than it is done at present.

23324. Do you think that the fireman should devote a large part of his time to ensure that this system of systematic timbering is being carried out?—Yes, I think that the whole of his eight hours, if eight hours is to be his shift, ought to be taken up in making inspections; he ought to be going round the whole of his time. I do not think that it should be possible for a manager to take away firemen to do other duties that can be done by the ordinary shift men. Inspection, in my opinion, means inspection all the time a man is on duty.

23325. His whole time should be devoted to looking after safety—ventilation, timbering, and general inspection of places?—Yes.

23326. Is his time taken up by anything else just now?—Yes.

23327. What do they have to do in addition?—They have to do all classes of oncost work, that is, day's wage work.

23328. Redding falls, laying roads, looking after getting out the trams and tubs, and pony driving?—Yes.

23329. Is the larger half of their shift taken up with looking after this?—Quite one-half.

23330. That generally applies in Fife?—Yes, in a large number of collieries.

23331. You say that you think their districts should be made much less than they are, and that their whole time should be devoted to looking after the workmen rather than to the general management of the colliery?—Yes.

23332. Would you be favourable to any precautions being enforced by Act of Parliament, which it was admitted might lead to safety so far as haulage accidents are concerned?—Yes.

23333. You think that anything which is admitted to be a precaution against accidents, or a preventive of accidents, should be included in the law?—Yes.

23334. So far as haulage inclined planes and all other kinds of mechanical haulage are concerned?—Yes.

23335. Are you troubled in Fife with underground fires more than in any other place?—More than in any other part of Scotland, so far as I know.

23336. I will leave that to Dr. Haldane to deal with. You say that safety lamps ought to be introduced into all mines where the Government inspector thinks that there is danger of an explosion. That would mean where the Government inspector is of opinion that safety lamps should be introduced because of danger from firedamp, that he should have the power to enforce their going in?—Yes.

23337. He has not that power at the present time?—No.

23338. Do you think it would be safe and wise to leave that in his hands?—Yes.

23339. You are satisfied that the Fatal Accident Inquiry (Scotland) Act has conferred sufficient power on us, so far as inquiries are concerned. It is reasonably satisfactory?—Yes, so far as our experience goes. I may say our experience is short as yet, but at present it is fairly satisfactory.

23340. We have considerable power under that Act, and generally that inquiry is satisfactory to us?—Yes.

23341. There might be a serious explosion or accident which would justify us in asking for a second inquiry?—I think that we should have that power in special cases such as you mention.

23342. That is one thing which is claimed by our Bill?—Yes, that is so.

23343. (*Mr. Ratcliffe Ellis.*) I understand that you ceased to work in the mine four years ago?—Yes.

23344. The working in Fife is likely to be extensive in future?—Yes.

23345. And likely to be carried on under conditions of greater danger?—Yes.

23346. You think that more care would be required on the part of the manager and the officials, and, I suppose, you also think that more care would be required on the part of the men?—Yes.

23347. Are you doing anything in the way of instructing the men as to this, that they should take more care under the new conditions?—Do you mean personally, or the association that I represent?

23348. I mean personally.—Yes, I take advantage of any opportunity that comes in my way to impress that upon the men.

23349. What opportunities are there you take advantage of?—Mainly in conversation with the men.

23350. Do you attend many meetings and give many addresses?—I attend a few meetings.

23351. At these public meetings do you impress that upon the men?—I have not done much as yet at the public meetings.

23352. But you intend to do so?—I think that may be part of the duty of the leaders of the men in the future.

23353. You think that they should do that—take opportunities when they give addresses to the men, of impressing upon them the necessity of precaution and care in their work. Government inspection, you think, should be once in every six months at each mine?—Yes.

23354. Will you tell me what you mean exactly by an inspection?—I mean that every part of the mine where men are working ought to be inspected when the Government inspector comes along.

23355. Supposing the Government inspector knows the pit, do you think he could form a sufficient opinion to satisfy your views as to the entire condition of the pit by sampling a specimen, inspecting a part, and seeing the conditions under which it was worked. Do you think that he would be justified in assuming safety was provided for throughout the whole pit?—I do not think that would satisfy me. I think that the whole of the mines ought to be systematically inspected.

Digitized by Google

23356. Do you think that two inspectors in Fife where there are over 20,000 miners could make a sufficient inspection to satisfy you?—The inspection would be very much superior to what it is now.

23357. To satisfy you that would mean one to each 10,000 men?—Yes.

23358. You consider that would be sufficient inspection in order to secure safety?—I think it would go a long way to secure safety anyway. Of course experience would teach whether they were able to cover the ground in an effective way, if my suggestion was given effect to.

23359. Supposing they could cover the ground, and each colliery was inspected as much as you consider necessary, once in six months, as far as inspection is concerned that would satisfy you in the direction of securing safety?—Experience would show whether it would be entirely satisfactory or not.

23360. Your present opinion is that is all that you would require, so far as inspection is concerned?—Yes.

23361. You do not seem to think that these firemen who are engaged are competent for their work. Do you think that the possession of a certificate would improve their competency?—I think so.

23362. What certificate is in your mind which they should possess?—I think that the certificate would be under rules made by the Secretary of State.

23363. It would be a Home Office examination?—Yes.

23364. Would a second-class certificate, now, meet your views?—I think it would; but I think the examination ought to include ambulance training also for the firemen.

23365. I daresay you are aware in some cases, although they do not make it a necessary qualification for a certificate, they say it is desirable that a certificate should be obtained?—I am aware of that, but I think it ought to be one of the necessary qualifications and parts of the examination.

23366. For a second-class certificate? Do you approve of the suggestion which has been made that when once the fireman is appointed the management should not be entitled to discharge him?—I think that at least the attention of the Government inspector should be drawn before the fireman is discharged.

23367. There is no other official about a colliery who is in that position now?—I look upon the fireman as being the most important official.

23368. There is no other official in that position?—No.

23369. Would you make the fireman the only man who should not be removed at the will of the management?—Yes, as far as I see.

23370. What is the manager to do before he can remove him?—I would suggest that he should report the matter to the Government inspector, and if, in the opinion of the Government inspector, there was not sufficient reason for dismissal, that the Government inspector should have the power to ask the manager to retain the services of the fireman.

23371. In point of fact, that he should not be entitled to dismiss him without the sanction of the Government inspector?—That is so.

23372. If the inspector said, "I do not approve of your dismissing this man," and the result of his being retained is an accident, would you relieve the manager of the responsibility of that accident?—If that method was in operation the fireman would be more under the charge of the Government inspector for the district.

23373. I should like you to answer the other question?—I would not be entirely prepared to relieve the manager of his responsibility.

23374. Do you think it would be right that the control of the officials should be taken from the manager and placed upon the Government inspector, and still that the manager should be held responsible?—I do not mean that the entire control should be taken from the manager.

23375. You mean the entire control as to whether he should discharge him or not?—What I said, of course, was, that the matter ought to be reported to the Government inspector, and that the Government inspector should be made aware of all the circumstances, and he and the manager could talk that over.

23376. I think your scheme must go further than that to be of any use. I understood you to say unless the Government inspector approved of it he should not be entitled to dismiss him. Supposing the Government inspector says, "I do not approve of your discharging that man," and his retention is the cause of an accident, is the manager still to remain responsible for that accident, or the Government inspector, or who is to be responsible?—I would not be prepared to say that the manager should be entirely relieved of his responsibility.

23377. Do you think it fair upon the manager that he should be put into that position?—Of course I am giving you a suggestion which, in my opinion, would lead to greater safety than at present prevails.

23378. I want you to tell me, do you think it is fair that a manager should be placed in that position?—I think it is fair if it leads to greater safety.

23379. Do you think any manager who is worth his salt would accept a position of that sort?—I may say frankly that I have talked that matter over with some managers in my county, one of whom was quite favourable to the fireman being put more under the control of the inspector than they are at present.

23380. Have you found any manager who would accept the position I have suggested to you who would like to be put under such a scheme, to be held responsible and still have no control over the fireman?—He would still have a certain amount of control.

23381. He has practically none. He cannot discharge him without the sanction of the Government inspector; have you found a manager who would consent to remain responsible and give the Government inspector control over his fireman?—Of course, that is a question which I have not asked them.

23382. It wants a little more consideration, does it not? With regard to inspection under Rule 38, as far as safety can be got by inspection, I know what satisfies you. You want General Rule 38 extended so that persons who are permitted now to inspect should do so as a matter of right?—Yes.

23383. Am I right in supposing that this inspection under Rule 38 is intended to satisfy the men of the safety of the mine?—Yes.

23384. The gentleman who gave evidence before you, Mr. Brown, said he was the sort of man that ought to be eligible to make an inspection. That gentleman had not worked in a pit for 21 years—perhaps it was not Mr. Brown: it was Mr. Wilson, I think. Do you think an examination by such a man would be more likely to satisfy the men of the safety of the pit than an examination by two of their own number working in the pit—two of their mates? Put out of your mind for the moment the fear of reprisals. Taking it merely as a question of satisfying the men, do you think they would be more satisfied with an examination of two of their colleagues who were undertaking the danger—if there was danger—than by a gentleman whose experience underground is 21 years old?—If the alteration in the law was such as I have suggested, what would be the more likely to happen would be that the powerful associations at least might see their way to take two men from the working face now and appoint those men to make inspections on behalf of the workmen.

23385. That is not an answer to my question. We will consider after as to the men being afraid, but put that aside for the moment. With the object of satisfying the men that the place is safe would not they be more likely to be satisfied with a report from two men who were to be subject to the danger (if any) themselves, than that of a man entirely out of danger and whose experience below was 21 years old?—Very much would depend upon if that person was keeping himself in close touch with the underground workings. I may say, speaking for myself, I have been four years out of the pit, engaged at other work apart from being a miner, but I frequently, in the discharge of my duties, go underground—in fact I was there yesterday.

23386. If you say you do not know, I will not pursue it any further. This is the state of things. The men in the pit are afraid the place is not safe. Two of their number, who would be subject to the same danger if they make a mistake, make an examination, and they report whether this place is safe or not. Do you think that the men would be more satisfied with a report of that sort than they would be likely to be with that of a man sent to have a look round whose experience underground

Digitized by Google

Mr. William Adamson.

13 June 1907

is 21 years old?—I think the men would have more confidence in an inspection made by one of the union officials or checkweigher.

23387. Will you please forget the union. I am talking about inspection to satisfy the men of the safety of the mine. The man says, "I am subject to the same danger; if I am satisfied you will be satisfied." Would not that satisfy the men? They probably would be union men who made the inspection. Is that not more likely to satisfy the men than to send a man down whose experience is 21 years old?

(*Mr. Enoch Edwards.*) He is rather suggesting that they want the right of appointment, and that it should not be limited.

23388. (*Mr. Ratcliffe Ellis.*) I want to see if the object of this is to satisfy the men. I want to know, first of all, whether a report by men undergoing the same danger on the face of it is not more likely to satisfy the men than bringing a man in who has not worked underground for 20 years, and who is not subject to such risk?—I believe the men would have more confidence in the party who could give an independent report.

23389. (*Chairman.*) You think that they ought to have the fullest power of choice, and that the men ought to determine whom they desire to send down. If Mr. Ellis's view is correct they would send down men working at the pits, but other people take a different view, and in other mines men might prefer your view and say they prefer a man who was not working at the pit, but who had, and who had had experience in many mines, and whom they thought would be better than any man they could send down for the moment in the pit?—And he would be clear of the fear of any future consequences that might happen from the employer.

23390. (*Mr. Ratcliffe Ellis.*) With reference to the question of fear, have you any reasonable ground for supposing that if there was a report made to a manager that there was something in the pit unsafe, the men would be discharged or put at some disadvantage?—I have no reason to say that they would be, but I say that there is a fear in the minds of the men that such a thing would occur.

23391. They think there might be?—Yes.

23392. Do you think that is a reason why this power has not been exercised?—I believe that is the chief reason.

23393. At times there are disputes between the workmen and the employer as to the conditions of their work underground?—Yes.

23394. At the present time if they want the agent to go down he has to get the permission of the management?—Yes.

23395. If you had this alteration that would not be necessary?—No.

23396. He could go down whenever he thought fit?—Yes.

23397. And make any enquiries he thought fit. There would be no limit upon that right?—He would make an inspection.

23398. Do you propose that there should be any precautions taken that he should not use this right for any purpose except for the purpose of making these inspections?—I would be quite prepared to say that if it was used for any other purpose it would be an offence under the Act.

23399. A Government inspector has specific instructions given to him as to what he is to do and what he is not to do by the Government?—Yes.

23400. There would be no such control over one of these inspectors?—No.

23401. Would you be in favour of having provisions made similarly controlling him as to the use of the power he is to be given?—Yes.

23402. You think them reasonable?—Yes.

23403. Now with regard to safety lamps, you say that the Government inspector should put them in whenever he thought fit?—Yes.

23404. Do you find any difficulty with the men in getting safety lamps in?—No. We have had a very short experience of safety lamps in my part of the country, but I find no difficulty, as far as the men are concerned, in getting them in if they are recommended.

23405-9. Is there an additional payment made when the safety lamp is introduced? Do the men require additional payment?—Yes. I find the men are paid a little extra.

23410. Is there a charge made for the lamps?—Yes.

23411. How much is that?—1d. per day in one colliery I know of—for one class of lamp.

23412. That includes oil, trimming, and keeping the lamp in order, and the cost of the lamp?—Yes.

23413. So far as your experience goes there is no objection by the men to the introduction of the lamps?—No, if it is considered necessary.

23414. Is that if the inspector considers it necessary?—Yes.

23415. Now, with regard to the special inquiry, you say that your Fatal Accident Enquiry Act in Scotland gives you pretty much what you want, but that there might be cases in which you should be able to have a special inquiry afterwards?—Yes.

23416. Who would be the persons to apply for that?—The persons interested.

23417. Who are they?—The relatives of the deceased.

23418. If they were dissatisfied with the decision they should be entitled to apply. Supposing a manager is censured or committed for manslaughter, would he be entitled to have an inquiry, too? Is he a person interested?—Yes, I think so. I think it would be only fair.

23419. (*Mr. Enoch Edwards.*) In your first paragraph you suggest that in making additional appointments practical experience ought to be one of the chief qualifications?—Yes.

23420. What sort of practical experience do you mean?—I mean practical experience of all classes of underground work—men who have been actually engaged in most classes of underground work, particularly face work.

23421. Do you mean to say must have been a collier working at the face?—I should say he would make a far better inspector if he had had that experience.

23422. Is it possible for many men who are practical colliers, men who work at the face, to have the necessary technical qualifications for this position?—I know a considerable number of men who at present hold first-class certificates and who have had experience at the face.

23423. They have now?—Yes, they have worked at the face; some are working now as ordinary workmen.

23424. Do you consider this to be a qualification? If the occupation of a man previously was assistant surveyor, assistant colliery manager, or chief surveyor to a colliery, do you think those would be sufficient qualifications for chief inspectors?—I do not. I do not consider it is desirable to have that class of man appointed.

23425. (*Dr. Haldane.*) Do you mean to say you do not think the experience of being an assistant colliery manager is sufficient?—No.

(*Dr. Haldane.*) In practical experience you mean?

23426. (*Mr. Enoch Edwards.*) You do not think that would be sufficient?—No.

23427. (*Dr. Haldane.*) Surely a man who has been an assistant colliery manager, and who has had very considerable experience of every sort of underground work, is, as a rule, sufficiently qualified?—I know a considerable number who have not had sufficient experience to undertake—at least, in my opinion—the duties of an inspector.

23428. It is a matter of what that means. It is a matter of what experience he has had as assistant manager, is it not? Many managers I know have gone through every kind of work that is done in the colliery by the colliers?—I know a considerable number who have not gone through every grade of work.

23429. It might or might not be a sufficient qualification. Is not that what you would rather say?—No, I would make practical experience one of the chief qualifications in making this appointment.

23430. This may imply very considerable practical experience. You could not say, from this statement on paper, which Mr. Edwards has quoted, whether these qualifications are in your opinion sufficient or not. You would want to know what the man had done in this case in the way of practical experience?—If I understand

Digitized by Google

Mr. Edwards' question aright, he said a man who had been an assistant surveyor or assistant colliery manager——

23431. (*Mr. Enoch Edwards.*) And then chief surveyor?—Yes. I do not consider that these qualifications are sufficient.

23432. (*Mr. Smillie.*) An assistant colliery manager might have had a very great deal of experience, but you would require to know what his experience as a colliery manager was?—Yes. He may have actually worked at the face.

23433. (*Dr. Haldane.*) Presumably he had, I should say, if he has had a proper training?—There are a number I know who have not. I do not consider that class of man would make good Government inspectors.

23434. (*Chairman.*) The mere fact that he has been an assistant colliery manager is not sufficient qualification. You must go behind and ascertain what he has done as an assistant colliery manager?—Yes.

23435. (*Mr. Enoch Edwards.*) I gather, after thinking this matter over, what the witness means is this: in your experience among men and the ways of dealing with things, you think a Government inspector, although he has had a thorough technical training, it is all the more desirable that he should have a practical training?—Yes.

23436. And you think if he has not had a practical training he should not be appointed?—Yes.

23437. (*Dr. Haldane.*) You would include in the practical training working at the face and real practical experience?—Yes.

23438. (*Mr. Enoch Edwards.*) Will you broaden that a little. If he has not worked at the face, but worked in a pit from boyhood and been of studious habits, having done all sorts of work in a pit, had, say 15 years of it, seen pit life and understood it, can set timber and understands the question—would you think that would be a qualification?—Well, I should rather it was a man who had a practical experience of all classes of mine work, including face work.

23439. He must have actually cut coal?—Amongst other classes of mine work I think he should have training in cutting the coal.

23440. Are there many men who cut coal who qualify themselves for first-class certificates?—Yes, there are a considerable number.

23441. I do not know what subjects are necessary to qualify for the position of manager in Scotland, but I know the nature of the subjects in England, as one of the managing board, and it seems to me that he would require to be a man of very studious habits and a considerable amount of intelligence, and to have an opportunity for training as well as cutting coal before he could pass an examination in England.—I know a considerable number of men who have had to make their opportunities, who have not had many opportunities lying at hand, but who have studied and obtained first-class certificates, and in my opinion they would make very good Government inspectors.

23442. That would apply to some of us here, who never went to school after nine years of age. That is the position. You think he would be better qualified if, in addition to his technical knowledge, he had practical experience at the working face?—Yes.

23443. (*Dr Haldane.*) You would go further and say it is essential that he should have practical experience?—Yes, if he is to make a good Government inspector.

23444. (*Mr. Ratcliffe Ellis.*) You would not appoint any inspector out of that class?—I mean to say if a man is an applicant for an inspectorship and there were men who had these qualifications I mention, if I had to make the appointment the appointment would go every time to that class of man.

23445. Do you say the law should be that no inspector should be appointed except from that class?—I think I would even be prepared to go that length.

23446. (*Dr. Haldane.*) From men who had gone through practical work at the face?—Among other classes of mine work.

23447. (*Mr. Enoch Edwards.*) Mr. Adamson suggests whatever practical experience a man may have, he must be otherwise technically qualified, but he must have this experience too?—Yes.

23448. You say that preference should be given, all things being equal, to the man who has worked at the face?—Decidedly.

23449. (*Mr. Ratcliffe Ellis.*) Would you apply that also to a manager's certificate?—I think I would be prepared to apply that to the qualifications necessary for a manager's certificate being granted.

23450. That it should not be granted to a man who has not those qualifications?—No.

23451. You would go as far as that?—I mean it should not be granted.

(*Mr. Enoch Edwards.*) If the number of people applying for certificates are equally trained and educated, you think that the preference in all cases should be given to the applicant who has had a practical training, and that until an applicant who has had no practical training can show he has had it, he should not be given the certificate.

23452. (*Mr. Ratcliffe Ellis.*) You will not give a certificate to any manager except to that class who can show that they had the experience which you consider necessary to qualify an inspector?—Yes.

(*Dr. Haldane.*) Is there anyone here who is on an English examining board?

(*Mr. Enoch Edwards.*) Yes.

(*Dr. Haldane.*) Do you not insist on looking into a man's practical experience, to see whether he has actually worked underground?

23453. (*Mr. Enoch Edwards.*) Many men get first-class certificates in England who have very little practical knowledge of working at the coal face, but not in the sense Mr. Adamson has put it. They have worked in the pit in some form. If he is a surveyor he is in and out of a pit?—You mean he has knocked about the pit.

23454. (*Mr. Enoch Edwards.*) Yes. With reference to the question of inspection under Rule 38, Mr. Ellis put a series of questions upon this. What you mean is, that either persons who have been employed in the mine should be appointed or others. You mean that the workmen should have the right to appoint whom they thought fit, whether in that mine or in another mine, or out of the mine?—Yes. 38

23455. That is what you mean?—Yes.

23456. You would have regard to the experience they had in the mine?—Providing he has been a practical working miner.

23457. And the choice should not be limited to that pit or the men working in other pits?—Yes.

23458. (*Mr. F. L. Davis.*) On the question of firemen, how do you explain the fact that the owners appoint so many incompetent firemen? What is the reason for that?—One of the chief reasons I have already given. I do not think the pay in this part of the country is a sufficient wage to get the best class of workmen. I look at this question personally from my own practical experience as a working miner. I could have been a fireman on more occasions than one. My chief reason for refusing was that I could earn about 2s. a day on an average as a miner more than the employer was prepared to pay me as a fireman.

23459. You will admit that the manager who asked you to be a fireman was a man of great judgment, he wanted to get a good man in you?—That may be so.

23460. Your point is that the men are not well enough paid?—That is one of the chief reasons; I have other reasons, of course.

23461. Is not that very short-sighted on the part of the manager, because, after all, he is responsible. If anything goes wrong he is responsible for the wrong-doing of his officials in any serious accident?—I should say it is a short-sighted policy.

23462. I cannot understand the managers, who have all the responsibility, constantly appointing incompetent men. That is the thing that puzzles me. You think they do?—Not always. I know some very good men who are firemen.

23463. You do not put it forward as a general thing?—No.

23464. Did I understand you aright to say that you are in favour of more inspectors being appointed?—Yes.

23465. Was I right in understanding you to say that however many more inspectors were appointed they should be all of the same class? You would not have two or three different grades of inspectors?—Whatever additional appointments are to be made, I think it would make for greater efficiency if practical experience was regarded as one of the chief qualifications.

Digitized by Google

Mr. William Adamson.

13 June 1907

23466. I was not sure whether I caught what you said. However many more inspectors are appointed, you think that they should all pass the same examination ?—Yes.

23467. Will you tell me why the timbering of his place is not always done by the coal getter ? I think you stated that it should be done by him and is generally done, but there are cases when he does not do it when he ought to do it. Will you tell me why ?—So far as our district is concerned there are very few cases in which it is not done by the coal getter. There are a few of the collieries, where machines have been introduced, where they have a special set of men for doing the timbering, apart from the men in charge of each of the faces, but I am not favourable to that method of timbering.

23468. You told us frankly that you thought the collier was the best man to do the timbering ?—Yes, with experienced men in charge of the working face, in conjunction with a limitation being put on the area under the supervision of the fireman. so that he could give closer supervision to the operation.

23469. And that he should have more time to look round and see that the colliers have the timbering necessary for their safety ?—Yes.

23470. You said sometimes they do not do as much as they might do for their safety. What is the reason that they do not do it ?—One of the chief reasons is, that they are paid by results instead of by so much per shift, and in their anxiety to earn wages sometimes they forget the more important duty of attending to their safety.

23471. Do you suggest that the fireman, having more time at his disposal, could keep them up to the mark, so to speak. by looking round the faces more often and seeing that they do what they ought to do ?—It would remedy matters.

23472. It is the anxiety of the collier to get as much coal as he can—he is paid by results—that sometimes makes him take risks that he otherwise would not do ?—Yes, that is so.

23473. (*Dr. Haldane.*) In your district the coal is subject to spontaneous fires to a considerable extent ?—Yes.

23474. Do those often lead to fatal accidents ?—We had one accident whereby six lives were lost in 1891, and we had one accident last year whereby two lives were lost.

23475. Is there much destruction to coal through these fires ? Have districts to be shut off ?—Considerable areas in some parts of the county have to be shut off in consequence of underground fires.

23476. Are these districts often permanently lost—I mean these areas of coal ?—Parts of them are.

23477. Have you ever had any experience of working at one of these underground fires yourself ?—No.

23478. You are of opinion that life-saving apparatus should be provided with a special view to these fires ?—Yes.

23479. Is that a general opinion among the men ? Have you any reason to know about that in Fifeshire ?—A considerable number of the men consider that.

23480. Are there no appliances of that sort used in that district ? Are there no smoke helmets or anything of that sort ?—Not up to the present time.

23481. Never; in dealing with fires or building up a gob fire are they used, so far as you are aware ?—No, not to my knowledge.

23482. You are of opinion that they would be useful ? Is that in the way of saving life or of saving property ?—Both.

23483. The gob fires are fairly frequent, and there would be fairly frequent occasions to use these apparatuses from fire alone, apart from explosions ?—Yes.

23484. With regard to lamps, I see that you suggest that three of the best kinds ought to be scheduled, and that the manager should be left a discretion as to which of the three will be best for use in the mine under his charge. I suppose you do not mean to say that only three should be scheduled ? You suggest that the Home Office should pass types of lamps just as they pass types of explosives ?—Yes.

23485. There should not necessarily be only three for the management to choose from. Why do you limit the number to three ? Do you mean, at least three ?—I think I would limit the number to three of the best kinds.

23486. It is very invidious to say which is the best kind. If they all pass a certain test by the Home Office Inspectors, or whoever has to deal with it, it is very difficult to say which is the best. The makers send up lamps which pass the Government test. Why should you limit the numbers available at any colliery ?—It is with a view to avoiding accidents as much as possible by possibly having an inferior class of lamp in use.

23487. So far as accidents are concerned it is surely possible to make all lamps thoroughly safe, and to allow no lamps to pass that are not thoroughly safe so far as it is possible for human ingenuity to make them safe ?—It would meet may view if they were tested by the Government officials and scheduled.

23488. You would not necessarily limit the number available. Some lamps might give better light. There might be advantages in one lamp over another in certain seams. You do not mean that necessarily you would limit them to three or to a small number ? You would allow the manager to pick any of the types which had passed the Government test ?—Yes, I think I would be prepared to do that. What I really meant was that they should be tested and scheduled by the Government.

23489. That is a recommendation we have had from several sides. With regard to ankylostomiasis, are there any mines to your knowledge that are both deep and wet in Fifeshire ? Are you aware that it requires damp as well as heat to propagate this disease ?—Yes, there are some parts of the mines in Fifeshire where they are over 300 fathoms, and where there is a considerable amount of water.

23490. These mines would be places where the disease might propagate if it was introduced ?—And where the temperature is in some cases 70 degrees.

23491. Have you observed that there is mess about in Fifeshire—human excrement ? Are the mines fairly clean ?—In the main they are, although I think that, in view of the fact that the temperature in some parts is fully 70 degrees, a recommendation should be issued from somebody in authority drawing attention to the danger, with a view to steps being taken to have sanitation as fairly reasonable as possible, prevention being, in my opinion, better than cure.

23492. Do the men make use of the goaf for sanitary purposes ?—That is the general practice.

23493. If that is so, I suppose there is not much mess by that method. I suppose it is buried in the coal and dust very soon ?—Yes, although occasionally it is done in other parts.

23494. Are there many ends, and places of that sort, which get dirty to your knowledge ?—There are some I have seen.

23495. I suppose these are the worst places in the mine ?—Yes.

23496. Do you think it would be a good thing if sanitary conveniences that were regularly emptied were emptied at places of that sort ?—Or, rather, if it were recommended that where men have to answer the call of nature they should do it in such a safe place as the goaf, where it could be buried.

23497. Do you think it possible to arrange that in most of the Fife mines, because I think it is excellent if it could be carried out ?—I think it could be fairly well carried out if the men were convinced there was a real danger.

23498. (*Chairman.*) Fines can only be inflicted by agreement between the men and the mining officials ?—Yes.

23499. Supposing an official said to a man, "We want to fine you for a breach of discipline," and the man said, "I will not submit to a fine; if you want to prosecute me you can; I do not believe I am guilty; I want to have my case tried in a court of law;" do you think any notice would be taken of that attitude. Would it entail dismissal or reprimand or any unpleasant consequence ?—It might. That danger ought to be avoided by taking away the power from the manager to inflict fines.

23500. They have no power unless the men agree, but it has been suggested if the men do not agree they have the whip hand, because they can dismiss them ?—Yes, that is so.

Digitized by Google

Mr. William Adamson.

13 June 1907

23501. Do you think that is so, or do the men always agree to fines?—There is that danger, and the men, recognising there is that danger, are apt to agree to a fine.

23502-3. Even though a man may consider that he is wrongfully accused and fined, still he thinks it worth while to pay a fine rather than insist upon being brought into court?—Yes, there is that danger.

23504. Do you favour coal-cutting machines, or not? Do you think as regards the safety of the mine the machines are an advantage or not?—I think that there is more danger attached to getting coal by machinery than by the old method.

23505. Have you any statistics which would show whether or not it is more dangerous in practice?—No, I am simply giving you my own opinion.

23506. Do you think that there is more danger from falls of roof and sides?—There is more danger, particularly from falls of roof.

23507. There has been evidence to show that unless you are very careful there is much more coal dust and much finer coal dust by the machine than by the ordinary way, and that might be objectionable from the point of view of safety?—Yes.

23508. If coal-cutting machines are to supersede in future to a great extent the ordinary methods of hewing, great precautions will probably have to be taken?—Greater precautions than we have been accustomed to up to the present time.

23509. You say you did not take the position of a fireman because of that 2s. a day less. Were you certain as a hewer of constant employment?—I had to run my risk, of course, but I found that on the average I could earn more money.

23510-1. Not quite 2s. a day more, but something more?—Yes, about the sum I have said.

23512. Supposing they had offered you wages which would have given you rather more than you would have got as a hewer, would it have crossed your mind that it might be disadvantageous to you to become a fireman, because you might have been dismissed or get into disgrace if you reported unfavourably of the mine?—That is another one of the difficulties.

23513. Then it did cross your mind?—Yes.

23514. You yourself say that you would have felt that it was a possible state of things that you might have got into disfavour by giving a report which you considered true and which the manager might have thought was a biassed report?—Yes.

23515. Supposing these firemen's duties were confined, as you think they ought to be, to looking after the safety of the men, do you think in that case the managers would be likely to obtain better men as firemen than they do at present?—Yes.

23516. At present I understand you hold the theory, whether it is a just one or not, that the employer is influenced in appointing firemen by his ability to look after the management of the mine, I mean the trams, and so on: a manager when he now appoints a fireman has regard not only to his capability of attending to the safety of the men, but also his capacity as a kind of assistant manager?—Yes, I have already said I favour the firemen having to undergo an examination and a certain test, and if that view is to be given effect to in the future, the managers' choice will be limited to the men who have undergone that examination and passed it successfully.

23517. You consider that there would not be very much in the objection if men were obliged to pass this examination, and if the choice of the managers was restricted in the way you suggest, as regards the question of getting good men as firemen. You think that would be settled sufficiently, and that as regards the question of getting good men, it would not matter what the duties of the firemen were?—If that view was given effect to, it would lead to the wages of the men being increased.

23518. And you would get better men. As regards safety, do you think it is extremely desirable that the fireman's duties should be confined to looking after the safety of the men?—Yes, I think they should be entirely confined to looking after the safety of the men.

Mr. WILLIAM WEBB, called and examined.

Mr. William Webb.

23519. (*Mr. Smillie.*) Are you secretary and agent of the Stirlingshire Miners' Association?—Yes.

23520. Have you had considerable experience as an underground worker?—I have had about 20 years' experience underground.

23521. Has your experience as a miner been confined to coal mines?—Not solely.

23522. Did you work in mines in Cornwall?—Yes, for a short time, about 3 years as a lad.

23523. You had 17 years' continuous employment underground?—20 years in coal mines.

23524. You know all classes of mining work very well?—Yes.

23525. How long is it since you gave up being a miner?—13 years.

23526. Are you down the pit occasionally now?—Occasionally.

23527. Making examinations in connection with disputes?—Yes.

23528. With regard to the question of general inspection of mines by the Government inspectors, do you think the present inspection is sufficient or effective?—I think the present inspection is altogether inadequate to meet the requirements in any satisfactory manner.

23529. I suppose you will agree that the present inspectors are perfectly capable of making an inspection if they had sufficient time to do so?—Yes, I have not a word to say against them.

23530. But you are of opinion that it is a physical impossibility that they can undertake the inspection, which you, at least, would like to see undertaken?—That is it.

23531. They do visit the mines occasionally?—Occasionally they do.

23532. In the event of a fatal accident taking place, or an explosion, or if their attention is called to any threatened or apparent danger, they at once visit the mine?—They are on the scene at once, as soon as convenient.

23533. In the event of an accident they usually visit the place where the accident takes place only?—Only.

23534. In the event of their attention being called to a danger or want of ventilation, they visit the portion of the pit to which their attention is called?—That is my experience.

23535. Or if an inspector was informed by letter either anonymously, or by the agent of the miners, that the whole of the colliery was in a bad state, he would, in all probability, make a thorough inspection of the colliery?—We should expect it to be done.

23536. Have you known such a thing to be done?—Yes, I have known recently where a colliery was thoroughly inspected on the ground you state.

23537. Your chief complaint at the present time is really that the inspectors have not the time to devote to the matter?—That is it.

23538. That is provided you are right in thinking there should be a thorough examination of the mine?—Undoubtedly.

23539. I suppose your experience, as a miner and as a miners' agent, leads you to the conclusion that the mere sampling of a mine, by going to one particular part of it, is not the best method of finding out whether or not the Mines Act is being carried out thoroughly?—That is my opinion.

23540. Are you of opinion that inspection by Government inspectors has tended to greater safety underground?—I am inclined to think so on the whole.

23541. You think an inspection of that kind would still further increase the safety?—I do.

23542. You are of opinion that there should be an increase in the number of inspectors?—Yes.

23543. Do you think it would be a wise provision to draw them from the ranks of practical mining men who had practical experience as underground workers?—As I have said, I have not the least fault to find with the present inspectors—I believe they perform their duty according to the time they have at their disposal, but I certainly would be in favour of drawing them from what we call our practical working miners.

Digitized by Google

Mr. William Webb.

13 June 1907

23544. Other things being equal do you think it would be an additional qualification if they had experience of underground working?—Yes.

23545. You think they should have all the scientific and technical knowledge possible?—Yes.

23546. But it would be an additional qualification if they had the experience of being practical working miners?—Yes.

23547. Do you think that the present method of appointing the firemen, that is, that the manager shall appoint a person, is altogether unsatisfactory?—I do.

23548. Is it your opinion, and the opinion of the miners in Scotland generally, so far as you know, that the best men are not at all times chosen for that position?—That is my information and that is my experience as well.

23549. Has it been your experience that a really competent person who was sufficiently strong-minded and capable of carrying out the Mines Act is not likely to be kept for any lengthened period?—I know a gentleman such as you mention, and he had a strong will of his own and desired to sign the book according to his judgment, and he was called in question for doing so and had to leave the colliery in consequence.

23550. Called in question by whom?—By the manager.

23551. (*Mr. Ratcliffe Ellis.*) Was he discharged?—He had to leave the colliery, and it was attributed to this, that he signed the book that there was danger.

23552. Was he discharged?—It was called in question, and immediately afterwards he had to leave the colliery, and he attributed it to his action in signing the book.

23553. Did he leave of his own accord?—I can scarcely say.

23554. (*Mr. Smillie.*) Was he discharged?—Well, there are two ways of discharging a man, you can give a man a place where he cannot earn a livelihood, and he must live you know.

23555. (*Mr. Ratcliffe Ellis.*) What was done in that case?—He said he had his place so much interfered with by the manager that he left.

23556. (*Mr. Smillie.*) Is it possible for a mines' manager to make the position of a fireman so unbearable that he is obliged to leave?—Yes, and firemen have also told me they have signed the book with the pen, which from their conscience they were opposed to, that all things were right, when in their very heart they knew it was not so, but on account of the position they were placed in they did it.

23557. You are now speaking of what fireman have told you?—Yes.

23558. In addition to that, you know it is common talk amongst firemen and miners generally that the position of firemen at many colleries is this: that they must do exactly what the manager tells them in regard to signing the book?—I think so in many instances.

23559. If the law provided that firemen must hold a certificate of competency, which has been secured by examination, do you think that that would improve the status of firemen?—I think it would improve it greatly, and I would be in favour of firemen being altogether independent of the workmen and altogether independent of the manager.

23560. Even supposing they have a certificate, if it is still in the power of the manager to dismiss them, you think they will not be as free as they otherwise should be?—That is my opinion; they will be still tied to a certain extent.

23561. Is it the opinion that the ordinary report-book which a fireman signs in Scotland, is all printed matter with the exception of the name of the fireman, or almost all printed matter?—We are given to understand it is so.

23562. Have you seen a report-book?—I have not.

23563. You cannot speak to that?—I cannot.

23564. Do you think a second-class certificate—that is a second-class mine manager's certificate—would be sufficient proof of qualification for a fireman?—I think it would be an improvement on what it is now.

23565. Are you prepared to give an opinion as to whether it would be sufficient?—I do not care to give an opinion upon that.

23566. What is a fireman supposed to do at a morning inspection?—He is supposed to go round to all the working places. In my opinion the area he has to cover is far too great for the time at his disposal. It is just a hurrying round.

23567. He is supposed to examine all the working places?—All the working places.

23568. Is he supposed by that examination to find out whether or not there is any danger from the roof being in a bad condition?—Yes.

23569. In the whole of the working places?—Yes, in the whole of the working places.

23570. He is also supposed to ascertain whether or not there are dangerous accumulations of gas, either explosive or any other kind?—Yes.

23571. Is it the faces only, or is it his duty to examine all the roadways leading to and from the faces where men have to travel?—That is his duty.

23572. Do you think that the districts, so far as you know them from your own personal experience, are of such a nature as to enable a fireman within two hours in the morning to complete his statutory duties?—I have to qualify my statement to a certain extent; we have collieries where I think the fireman is quite able in the time of two hours to cover it, but we have other collieries where it is almost impossible for him to do it properly in that time.

23573. There are actually pits in Scotland where the Mines Act is being carried out?—Yes.

23574. Some of the firemen have districts where they can make a thorough examination?—Yes, small districts.

23575. But there are districts in which a fireman may have 50 or 70 men under his jurisdiction?—So much so that he has to change his clothes when he comes back after his inspection, he has been that heated up and exhausted.

23576. And that inspection might have been an examination of the faces alone, without the roadways at all?—Quite so.

23577. You do not consider that is a safe method of doing business?—Far from satisfactory.

23578. In some of the roadways leading to and from the face, which the fireman does not necessarily have to travel, there may be an accumulation of gas which would be dangerous?—Yes. Oftentimes the fireman takes a short road to go to a certain place.

23579. You are not blaming him now, but you are stating his district is too large?—Too large.

23580. And the only method of getting rid of that is to resign his position?—Yes.

23581. Under the present circumstances there would not be much difficulty in getting someone else to take his place I suppose?—That is just it.

23582. Do you know whether the miners in Stirlingshire or Lanarkshire, where you have had more experience, have ever been consulted in the framing of Special Rules?—I do not know of their being consulted.

23583. You agree that the miners who go underground every day should have some little say in the framing of rules for their own safety?—Yes, they should have some knowledge of what they think is requisite in the framing of Special Rules, and, whether right or wrong, if they are framed after consultation with them or their representatives, it would have a tendency for them to be more certain of them.

23584. I suppose you are particularly anxious, as a miners' representative, that the miners should carry out all rules which have been framed for their safety?—Yes.

23585. Do you find that the office-bearers of the Miners' Federation in Scotland are equally anxious with yourself upon that matter?—Yes: and we have gone the length of refusing to support a man in a court of law who has been found guilty of breaking rules.

23586. You decline to defend persons who are charged with breaches of the Mines Act?—Yes.

23587. Of course you would be prepared to defend any man who was a member of your Union if you were convinced he was not guilty?—Yes.

23588. There are a far larger number of accidents underground from falls of roof and sides than from any other cause?—Yes.

Digitized by Google

23589. Do you think there could be rules which, if carried out, would prevent a considerable number of accidents which at present take place?—I do think so.

23590. Do you think that the miners or their representatives, because of their experience, are quite as able as the mine-owner and the managers to draft Special Rules for the safety of the workmen?—I do.

23591. And you think they should be consulted in the drafting of the Special Rules?—I do.

23592. If that were done do you think both on the part of the men and their representatives there would be a greater tendency to observe the rules and see that they were carried out at the collieries?—I think there would be that tendency.

23593. There would be a more earnest effort made than there is at the present time to enforce the carrying out of rules in which the men have no voice?—Yes. I believe the men would stick to them more, knowing their own representatives had taken part in framing them.

23594. I suppose the miners sometimes carry resolutions at mass meetings and conferences, and special efforts are taken to see that those resolutions are carried out?—Yes.

23595. Do you think it would be possible to take the same course with respect to Special Rules which have been mutually adopted for the safety of life and limb?—Well, of course, that is a big question, but I think something could be done in that direction.

23596. A considerable number of accidents take place in travelling roads where there is haulage?—Yes.

23597. I suppose it constitutes a serious danger to have a haulage road at the same time as a travelling road?—Yes, that is one of our greatest dangers, I think.

23598. Have you worked in collieries were the ordinary travelling road by which the men travel to and from the face was also used as a mechanical haulage road?—Yes, I have, and escaped a very serious accident.

23599. Many accidents have arisen from that?—Yes.

23600. I daresay you have run very serious risks yourself on more than one occasion?—Yes, on more than one occasion, in stepping into the manhole.

23601. That might be because of the breaking of a rope or the breaking of a coupling?—Yes, a coupling disengaged.

23602. In a general way you would be favourable to incorporating in the Mines Regulation Act, or any Special Rules, all well-established improvements to prevent haulage accidents or accidents on haulage roads?—Yes.

23603. And where a haulage road is used, in addition to being used as a travelling road, that is where a travelling road is not provided specially, are you of opinion that there should be sufficient room between the rails and the side for the men to travel?—I am. Manholes to me are not sufficient to secure the safety of the men.

23604. You would not advocate the taking away of the manholes—they should be still continued?—Yes.

23605. Do you think they should be whitewashed once a month?—Yes, and then you would be able to see them better.

23606. There is sometimes a difficulty, if a man is being chased by a train of hutches which have broken away, in ascertaining where the manhole is?—Yes, and there is this: that oftentimes he runs into danger under the circumstances instead of going away from it.

23607. If there were manholes along all the haulage roads do you think that would tend to greater security?—Yes.

23608. Are you in favour of further alterations in the method of timbering, or as to who should do the timbering?—That is a question in respect of which there are two sides. Ordinarily you would say that the man who extracts the coal and knows the nature of the roof would be the best man to do the timbering, but so long as the present system is in force I think the best way would be to have competent men to timber.

23609. I suppose a number of accidents at the coal face arise from the system of piecework?—Yes, I can speak on that matter from my own experience. Just before I left the colliery I happened to be filling a hutch, and knew perfectly well that the roof was bad. It required to have a tree put to it, but I was so anxious to fill my hutch and get my next turn that I thought it might remain, but before I finished the stone came down and I was off for several weeks in consequence of it. I ran the risk because I was anxious that my turn should not go past. I thought if I could secure my turn I would do it.

23610. As to the theory that the man working at the coal face is the best judge of the nature of the roof, and where the tree should be put, that is merely because the man at the coal face has had considerable experience of the nature of the roof there?—Yes.

23611. And is watching it from hour to hour, or day to day?—Yes.

23612. But if there was a special person appointed for a section of 10, 15 or 20 places whose statutory duty or special duty would be to timber or to supervise the timbering, would he not also gain the same experience and perhaps more?—Undoubtedly he would.

23613. With the additional advantage that he would not require to care about the next turn, or about the wages?—Yes, that would not disturb him.

23614. His chief duty would be, whether he was the fireman or whatever official he was, to see that either the places were timbered by himself or that the miner timbered the places?—Yes.

23615. He would have power to prevent a person working away at the face if there was apparent danger?—Yes.

23616. Have you made up your mind as to which of those systems you would prefer?—Yes. I would prefer a competent man appointed for that purpose to do the timbering.

23617. In the event of his absence a man would still be required to put up a prop for his own safety?—Yes.

23618. Do you think if that were generally adopted, so far as the Scotch mines are concerned, it would prevent a considerable number of accidents which at present take place?—It is my honest opinion it would.

23619. And you give that from your own experience as a working miner?—Yes, my own experience.

23620. (*Mr. Ratcliffe Ellis.*) You say you know a case where the fireman at the instance of the manager, made a false and incorrect report in his book?—What I stated was that a fireman had told me that because he signed the book that a certain section was not safe, and a certain number of men had to go home, the manager called him in question for doing so, and of course, afterwards, knowing his position was such, and it was impossible for him perhaps to get a start again, he oftentimes signed the book by the pen which his very conscience was opposed to for the sake of keeping the position.

23621. That he made an incorrect report?—Yes.

23622. How long ago is that?—About 15 months ago.

23623. Is there any objection to giving the name of the colliery where it took place?—Well, if I should be compelled, of course, I would do so.

23624. You may have been misinformed?—True, I may have been misinformed.

23625. Will you communicate with the secretary the name of the colliery where this took place, and then inquiry may be made from the manager to hear his version of the matter?—I will do so if it is required.

23626. The man told you?—Yes, the man told me that because he himself signed that it was dangerous, the men could not work, and on account of that he had to leave the colliery shortly afterwards. Of course he attributed it to signing that it was dangerous.

23627. (*Chairman.*) Is that the same case? I thought you told us just now he was not dismissed, but he thought it prudent on his own behalf to leave?—Well, I told you there were two ways to dismiss a man.

23628. (*Mr. Ratcliffe Ellis.*) Is there any difficulty in having that man brought before the Commission?—I cannot say. If you desire it, and I come in contact with him, I will speak to him about it.

23629. (*Chairman.*) Will you communicate his name to the Secretary of the Commission?—I will.

23630. (*Mr. Ratcliffe Ellis.*) Is he not working at the colliery now?—No.

Digitized by Google

Mr. William Webb.

13 June 1907

23631. You do not know where he is?—No. I saw him not many months ago.

23632. (*Mr. Smillie.*) You will find out?—Yes.

23633-4. Is he a member of your union?—He was a member up to a few months ago—he may be on the list now.

23635. (*Mr. Ratcliffe Ellis.*) Then do you think if there are such cases as that which you mention, that having a certificate would protect a man?—I said I was in favour of their being independent of the employer, and independent of the manager.

23636. The mere fact of having a certificate would not do that?—No, it would not carry that out altogether.

23637. But a certificate might do this, it might make the fireman himself more careful, because if he was not a careful man and neglected his duty he might not only lose his situation but lose his certificate?—Of course there is that side of the question.

23638. That is a reason for having a certificate?—Yes.

23639. That it might make the consequence of misconduct more serious than if he had not a certificate?—A man having a certificate is supposed to have a little more knowledge than a man not having any.

23640. The consequences to a man with a certificate might be more serious than to a man without a certificate—you agree with that I suppose?—I do.

23641. As to the Special Rules, you think that the men would observe them better if they had a voice in making them?—That is what I say.

23642. Have they not had a voice in making them?—Not to the extent they should.

23643. Therefore do you think they do not observe them as well as they ought to?—I do not say that; but there is a strong feeling of discontent with the men on this matter. Although the rules might be the same, if they or their representatives were consulted it would somewhat allay that feeling. I think the miners are loyal in carrying them out as far as possible.

23644. As to the timbering done by the miner, which you have explained in your own personal experience you neglected to do in order to get more coal, the necessity for the additional firemen is to see that the men do what the rules require them to do?—I think we do that now.

23645. You say you were tempted to break a rule, which was not to put up timber where necessary in order to get a little more coal?—Then I might have evaded the fireman in the same way.

23646. If the collier will not look after his safety, how can you help it?—Those Special Rules where not in existence at the time I took that risk.

23647. That does not alter the point. If the men will not look after their own safety how can you protect them?—This is just an exceptional case I referred to. On account of the pressure brought upon the man in order to earn his livelihood he was somewhat neglectful of his duty. I say if competent men were appointed for the purpose of timbering that responsibility would be taken from the workmen.

23648. What you are suggesting is this, that because a man will not look after his own safety, you must put additional expense on the management to prosecute him or make him take means to look after his own safety. Would the better thing not be that the man should look after his own safety?—If he was put on time and not piecework it might.

23649. Then you think although at the present time it is necessary for his safety to see his place is timbered, he would risk his own safety in order to get more coal?—You must not imagine for a moment that I knew this stone was coming down.

23650. I suppose no one would do that, but what I understand you to say is this, the collier is tempted to risk his safety in order to get more coal?—Yes.

23651. Then you say, "Now you must put some additional expense on the management in order to see that this man does what he ought to do, that is, look after himself?"—I cannot see the drift of your argument.

23652. What is your view as to the voice which the men ought to have in making the Special Rules?—The men should be consulted in making those rules—there should be a kind of joint rules between the men and the managers; and, as I say, I think they would be carried out with better feeling by the men.

23653. Supposing the employer wishes to propose a Special Rule, we will say, imposing some additional obligation on the men, would you then consider that the men should have a right to say "No, that rule shall not be proposed?—So long as the rule is there, as I have told you before, we are in favour of carrying it out.

23654. I am taking the case of a proposed new rule which the employer wishes to propose. Do you desire that the men or their representatives should say "No, we will not have that rule proposed"?—I have always found where the rule is joint it is faithfully carried out.

23655. I want you to answer the question?—If an employer of labour was going to make a Special Rule which I knew I could not carry out, then undoubtedly I am in favour of breaking it.

23656. No. I am speaking of a new rule, which I want to propose—before I can send that to the Home Office I must have your consent to it?—Yes.

23657. Do you say "No" to that—that I cannot propose it?—Yes, you can propose it and put it before us for acceptance.

23658. Suppose you do not accept it?—Then we will ask you to amend it.

23659. If it is not accepted by you I cannot propose it? Is it your view that I should not be able to propose a new rule if you do not agree to it?—Well, that is the long and the short of it.

23660. That is, you would prevent me proposing a rule which I consider necessary for the discipline of my mine without your consent?—You know my argument. I contend the workmen as well as the managers should themselves mutually agree to the matters to carry them out.

23661. Suppose they do not agree? Suppose I propose a rule about increasing your obligation with regard to the timbering? Suppose I propose you should fetch it from the bottom of the pit instead of from the gate end, and you said "No, I will not agree," I could not propose it?—I have found this to be the case—a thing yesterday was perhaps impossible, to-day it became probable, and to-morrow it becomes an accomplished fact because we have negotiated together.

23662. What I want to ask you is this: Is not the owner to be allowed to propose a rule to the Home Office except with the sanction of the men?—Now you have come close. Of course, this is a free country, and I would allow any employer to propose what he feels disposed to, but in the carrying out of that I would like to have a voice in the matter.

23663. Then I may propose a rule, it goes to the Home Office, the Home Office advertise it and invite objections, and the men are at liberty to object if they think fit, and then if the rule cannot be agreed upon it should go to arbitration, and if not agreed upon then to a judge of the High Court. Would that meet your view?—That would meet my view perfectly well.

23664. (*Mr. Enoch Edwards.*) How long have you been working in Stirlingshire?—I never worked in Stirlingshire; during the 13 years I have been in Stirlingshire I have been an agent. I worked for 20 years in a coal mine in Lanarkshire, and three years in the copper mines in Cornwall.

23665. During those 13 years in Stirlingshire have there been any Special Rules at all?—There have been.

23666. Have they ever consulted you about them?—No.

23667. Has the inspector consulted you?—We were not consulted at any time.

23668. Or any of the men?—No.

23669. They brought out Special Rules and imposed them upon the workmen without consulting either the union or the men?—Yes. I know of none of us being consulted.

23670. I suppose you are aware that it is not the practice in England?—I have heard that.

23671. And of course it is largely due to the inspector—he has not condescended to consult with you?—That is just it.

23672. He has never asked to meet you or your men?—That is just it.

23673. In representing the views of the men here, you say now they would object to rules being imposed upon them that they have never been consulted about?—Yes.

Digitized by Google

23674. Of course those rules may largely interfere with their contract and their wages?—Yes.

23675. You say it is perfectly proper before such rules are passed that you should have an opportunity of considering them?—Yes.

23676. You say you have no fault whatever to find with the inspectors. There are not sufficient?—No, there are not sufficient.

23677. I understood you to say that they visit the collieries occasionally?—Yes, occasionally.

23678. How do you know? Have you met them?—I have met them or seen them at the colliery office.

23679. So that you know they do visit occasionally?—Yes.

23680. Do they profess to make a general inspection?—I question if they come once in twelve months.

23681. Have you seen one down the pit when you have been in it?—I have never seen them down a pit, only after an accident has taken place. I have seen them coming from the colliery and going to the colliery after an accident.

23682. They might be down the pit you worked in without your seeing them?—I have seen them similarly when I was working when an accident occurred.

23683. What is your view about these inspectors? Do you think their districts are too big?—With respect to some of our collieries their districts are too big.

23684. I am referring to the Government inspectors?—There are some who consider that they should have a certain number of men, and some have gone the length of saying 10,000. I may differ here, because I might think in a place where the men are congested there might be some places where 500 would be ample, and it is easier to inspect that pit with 500 men than to inspect five pits with 100 in each.

23685. It might be?—Yes.

23686. Much would depend upon whether they were old pits with extensive ramifications, and so on?—Yes.

23687. Scotland, for the purpose of inspection, is divided into two districts?—Yes, east and west.

23688. Have many men have you employed in Stirlingshire?—I think there are between 7,000 and 8,000 miners in Stirlingshire.

23689. How far would Stirling be from the office where the inspector lives?—I think it is Glasgow in our case—about 20 or 30 miles perhaps from Stirling.

23690. From the centre of your colliery how far would it be?—Pretty much the same, I should think.

23691. You agree that the number of inspectors is altogether insufficient? — Altogether insufficient to overcome the work satisfactorily.

23692. I understood you to suggest that the same thing applies to the firemen's inspection?—Yes, to some extent.

23693. You do not suggest at all the firemen are incapable of doing all the work at all the pits?—No, I am not going to say that, because we have some very small pits in Stirlingshire.

23694. What are the class of men?—In some cases we have young men, and in some cases they are men up in years.

23695. Would a young man have had experience?—We object to the young men because we do not think their experience is quite sufficient. With respect to the old men their judgment is good, but their physical ability causes an objection.

23696. Young men have very practical knowledge sometimes, but you would like to have a very young man with the head of the older man on his shoulders?—I think no man under 25 should act as a fireman and have a certificate of competency, at any rate.

23697. Do they appoint firemen under 25 years of age?—Yes, I think so, but I am not exactly prepared to say. I think we have one who does that work under that age.

23698. Do you suggest to this Commission, having regard to the importance of the office that a fireman holds, the colliery company would appoint a man under 25 years of age?—Yes, I think we have one.

23699. I do not want to press it too much, because he may have the certificate of a manager to manage a pit at 25?—Yes, that is so.

23700. After all, there would be some grounds for appointing him fireman?—Yes.

23701. You think they are rather young and they should have more experience?—I do.

23702. What wages do you pay them generally?—We are trying, wherever we possibly can, to get the standard wage.

23703. How much do you pay the fireman?—We have them from 5s. 3d. to 6s. 6d. now.

23704. Are they members of the union?—I am glad to say most of them are.

23705. We have been told that the reason why they are not a better class of fireman is because they do not receive more wages. If he is a member of the union he will have more than 6s. a day, or he will not work?—Something like it.

23706. They receive from 5s. 3d. to 6s. 6d.?—Yes.

23707. Is there much prosecution by the owners in the courts in your district?—No, not a great deal of that.

23708. Nor fining?—There has been an exceptional case now and again.

23709. It is not carried on to a large extent?—No.

23710. Do they fairly maintain the discipline of the pit?—On the whole, I think they do.

23711. I understood you to suggest that you and your people have taken means to advise men?—Yes, although we may consider that these Special Rules in particular may be severe, we do advise the men to abide by them, and in no case to break them.

23712. Their safety would not be worth much unless they were observed. In all your efforts you do advise the men to observe the rules?—Yes.

23713. I understood you to suggest that one of the reasons why you cannot keep these rules was because your living depends upon the amount of coal you send out?—That I give from my personal experience.

23714. Do you suggest that men should work day wage?—I would be in favour of time before the present system.

23715. Is that the opinion of your men in Stirling?—There is a division of opinion on the matter, but that is the prevailing opinion.

23716. Would your contractors who are in favour of men who know the work be ready to agree to day wages?—Contractors, I am sorry to say, employ men, and it does not matter whether they have been in the pit before or not. We have a great deal of trouble with them.

23717. That is an irregularity which you have not been able to conquer?—Yes.

23718. You do not suggest that Stirling would be prepared to accept the position of a day wage?—I am not prepared to answer that.

23719. They would not advise you to recommend it here?—The question has not been before the contractors.

23720. You are expressing your own views?—No, the prevailing opinion of the body of miners in Stirlingshire.

23721. All your work is done by contract?—It is all done by tonnage rate.

23722. There is not much coal got by day wage?—No, we have contractors who take headings or levels and employ the men to work them. That is what we term "contractors."

23723. Who work for them?—Yes, by contract. The men are paid by time or tonnage rate, but the contractor is paid by the output, and he pays those men.

23724. Do you mean that the contractors employ them? Do you mean to tell me that three or four men will take a pit contract and pay a man a day wage?—We have not got to that extent. We have contractors employing 20 men, and they pay sometimes so much per shift, and sometimes so much per ton.

23725. In that case, they are contractors too—they sub-contract with the chief contractor?—Yes, you can put it in that way if you like. We do not know what contract the contractor has made with the employer.

Digitized by Google

Mr. William Webb.

13 June, 1907

23726. The earnings of the men working by contract run higher than day wage?—We have found that in brushing particular.

23727. You are not prepared to say that all the people engaged in the industry would be prepared to work day wage?—It is a prevailing opinion among our men that they would like so much an hour like joiners and carpenters, and those sort of men.

23728. (*Mr. Smillie.*) Mr. Edwards is concerned to know whether the rank and file of your coal getters now paid by the ton, would be willing to accept a condition of matters in which they were paid daily wages. Is that in your opinion fairly prevalent?—I think it is fairly prevalent among our miners.

23729. (*Mr. Enoch Edwards.*) Who are not contractors?—No. We do not call them contractors at all. We call those ordinary getters of coal.

23730. Is that a new system—a man taking a place and employing so many men?—It is more particularly in the new collieries which we have started in Stirlingshire, and the employer gives the headings or levels, as the case may be, or branch to a contractor, and the contractor finds his own men, and pays them what wages he thinks reasonable.

23731. That is why he is driving out his work?—Yes.

23732. It would not follow when the pit is open when the men will take their own stalls?—Yes, of course.

23733. (*Mr. F. L. Davis.*) You say although the men complain sometimes of the discipline being rather stiff, that you advise them nevertheless, to obey the rules and regulations?—Yes, for the time being.

23734. What do you mean by the discipline being stiff. In what direction is it stiff?—There is a Special Rule about the gibbing of corks, that props must be placed a certain distance from each other.

23735. Now I want to ask you with regard to the timbering rules?—That is in the Special Rules: sometimes a fireman may find this is not done. We tell the men in all cases to do what the Special Rule tells them to do.

23736. Do you use your influence with the men to persuade them to carry out the rules whatever they may be?—Yes.

23737. I think you said that you were in favour of more Government inspectors being appointed?—Yes.

23738. Would you suggest that they should belong to a different grade or class from the present inspectors, or that they should all have the same qualifications and pass the same examinations?—I am perfectly satisfied with the ability of the present Government inspectors, and I even think that men from the rank and file, the workers themselves, who have had practical experience, might do.

23739. Would all these practical men in your opinion have to pass the same examination?—They would have to pass an examination to make them competent for the duties which they have to perform.

23740. Would it be the same examination as the present Government inspectors have to pass, or a different grade?—So far as the inspection of the mine is concerned by His Majesty's inspectors, I would be in favour of having them the same as they are now.

23741. Do you ever draw the attention of the Government inspectors to anything wrong which comes before you?—Yes, I do. I have drawn the attention of the Government inspectors to the want of air-current, and I am glad to say when I have, that they have given their attention to it, but if we were to draw the attention of the inspector every time the miners complained to us, they would be continually there.

23742. Do you find whenever you make a complaint that they come as quickly as they can and look into the matter?—Yes, but if we find a complaint by the workmen about the air, we mostly go to the manager and arrange to have it improved, and if it is not improved, we write to the Government inspector.

23743. That is quite right, I think. I am not going into the particulars of the case you gave, but I think you said that there was a general complaint amongst the fireman that they had to sign a book giving a false report?—I did not say that it was a general complaint, but these complaints I have heard frequently.

23744. Have you ever made any complaint to the Government inspectors about that?—No, I have not.

23745. That is a point which you would not go to the management about naturally, but if you thought it was such a serious thing as it appears to be stated to be by everyone of you here, why have you not drawn the attention of the Government inspector to it?—That is a very reasonable question to ask; but I might go a little further in reference to this matter. It is after the man has left the colliery that he says what has been done.

23746. Then I should think all the more reason why you should have drawn the attention of the Government inspector to this, that it is not an exceptional thing, but rather a general thing, having these complaints, so that you should put him on his guard and let him ferret it out for himself?—I have not drawn the attention of the Government inspector to the matter.

23747. If it is as serious as you try and make us believe it is, you certainly have not been doing your duty in not drawing the attention of the Government inspector to it?—We might have been too lenient.

(*Mr. F. L. Davis.*) We all make mistakes, I know.

23748. (*Dr. Haldane.*) I think you mentioned that you had worked in Cornwall?—Yes.

23749. Where have you worked?—Liskeard, in the East and West Caradon mines.

23750. Are you familiar with the arrangement they have in Cornwall for providing a drying place and a place for washing?—Yes, I have often wondered why it was not carried out here.

23751. Are you of opinion that it would be a benefit?—Yes, a benefit to the health of the miners.

23752. The arrangements in Cornish mines are not always very good. I do not mean to say that there should not be something better, but you are clearly of opinion that it would be a good arrangement?—Yes, a good arrangement.

23753. I mean an arrangement for leaving the pit clothes at the pit head?—In charge of the dryman.

23754. And combined for arrangement for washing?—Of course.

23755. Do any of the Cornishmen come up to Scotland, that you are aware of? You are the first Cornishman I have met here?—There are a few in my friend's district in Lanarkshire here.

(*Mr. Smillie.*) There have not been many new ones for a considerable number of years, but there are in Lanarkshire probably 100 families and they are now married and intermarried. They have been here 35 years.

23756. (*Dr. Haldane.*) It is not the custom for men to come up to Scotland for special kinds of work like pit-sinking?—No, it is not very prevalent.

23757. Or driving roads and stone?—No.

23758. Are you aware that they have a disease down there that is giving some trouble?—Yes.

23759. You do not think that any Cornishmen who might be affected come up this way?—No, I do not think he would: he would stay at home.

23760. They do not stay at home: they go to Wales?—They go to Wales much more than Scotland: it is much nearer.

23761. (*Chairman.*) Mr. Ellis has suggested if you have this system of timbering by men specially appointed for the purpose, it is like saving a man, so to speak, in spite of himself. I would suggest on the other hand, if you pay a man by the piece, and if it should so happen as it happened to you, he would lose rather a serious amount of his wages if he was to knock off his work in order to prop up a roof, that is something like leading a man into temptation?—The man would not require to knock off his work.

23762. Under the system you were working when you noticed that the roof was in a somewhat dangerous condition you would have been obliged to knock off work and to have fined yourself some shillings. That is what it amounted to.

(*Mr. Ratcliffe Ellis.*) The tonnage rate which is paid is arranged on the assumption that the timbering is done by the management.

23763. (*Chairman.*) No doubt it was—I will not say a dereliction of duty on your part—but it was taking a risk that you ought not to have taken?—Yes.

23764. In order to save a few shillings?—Yes, it may be only 1s.

Digitized by Google

23765. In order to save 1s. you took the risk?—Yes, that is just it.

23766. Mr. Ellis suggested that it would be hard on the management in such a case as that where a man, to save a comparatively small sum of money to his own pocket, takes a risk he ought not to have taken and the management should be put to any expense through a man having acted in that way. This is the way Mr. Ellis puts it. That the management did give the men warning it was their duty, and that they were paid on the assumption that they did knock off a sufficient number of hours from their work to sufficiently timber the roof. That is the contract between you and the management?—Yes.

23767. On the other hand, human nature being what it is, it is rather like leading a man into temptation I should say?—Yes.

23768. If you accept that view that where a man is put in a position where his safety may conflict with his monetary interest, it appears to me that one must go further than one does in the matter of supervision of the men. Surely we now do protect men against their carelessness?—Yes.

23769. For instance, in shot-firing there is no doubt the rules are made to protect men against their carelessness?—Yes.

23770. To some extent those rules may put a certain amount of small expense on to the management. I am inclined to take the view that it might be advisable, and that it is not such a great hardship on the management that they should be put to some expense with the view of placing the men in a position in which they shall not be exposed to a certain amount of temptation, because, although it may be true succumbing to the temptation is a culpable thing, still, by putting them into that temptation, human nature being what it is, every now and again they will succumb to the temptation, and that will mean an accident. What I put before you is this. It might be said that there is this difference between shot-firing and timbering, that the man that neglected to put up timbering endangers his own life, whereas in shot-firing he endangers the lives of other people?—Yes.

Mr. William Webb.

13 June 1907

23771. In this way I would also put it that a man's life is not merely his own concern, it is the concern of his wife and family as well?—Yes.

23772. Therefore I think that there is a very fair analogy between the case of a man who, by the system in vogue, is led into the temptation of not taking as much care of his life as he ought to by want of timbering and the analogy of a man who by putting in a careless shot endangers not only his own life but the lives of others. I would rather suggest that it might be the duty of those who are commissioned to look after the safety of the miners to see as far as possible that the system of working is such that a man shall not be led into temptation. That is rather the point of view I should look at it from. I do not know whether Mr. Ellis would like to say anything about that.

(*Mr. Ratcliffe Ellis*). I should differ from that.

23773. (*Chairman.*) I suppose you say that the whole system should be to some extent altered, and the contract between the men and the management should be different from what it is at present as regards timbering. We will not take into consideration day wages or piecework. The contract at present is that the man himself is responsible for the timbering?—Yes.

23774. He is paid on the supposition that a certain amount of time is taken up with timbering.

(*Mr. Ratcliffe Ellis.*) Whatever is necessary.

23775. (*Chairman.*) That form of contract encourages a man to take certain risks which he ought not to take. That is your argument, that the form of contract encourages you to take certain risks which otherwise you would not take?—Yes.

23776. Therefore the better plan would be to alter the contract between yourself and the management, and to say that the management should be responsible for the timbering, and you only for the hewing, and that being the case you would be willing to enter into another arrangement with the mine-owners with a view to finding out what would be a fair wage for the hewing?—Yes.

THIRTY-FIFTH DAY.

Wednesday, 26th June, 1907.

PRESENT:

Lord MONKSWELL (*Chairman*).

WM. ABRAHAM, Esq., M.P. (Rhondda).
F. L. DAVIS, Esq.
ENOCH EDWARDS, Esq., M.P.
THOMAS RATCLIFFE ELLIS, Esq.
JOHN SCOTT HALDANE, Esq., F.R.S.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. WALTER MARRIOTT, called and examined.

23777. (*Chairman.*) I understand you attend here on behalf of the Derbyshire Miners Association?—Yes.

23778. Please tell us what are the objects of the Association, and how many members it has?—The objects are, to a great extent, to secure benefit for its members, the members numbering 33,200 odd.

23779. The objects are to do the best you can in their interests?—Their interests, and securing the safety of the miners that they represent.

23780. (*Mr. Enoch Edwards.*) The rules, I suppose, set out the objects?—Yes, they do, and I will send you a copy.

23781. (*Chairman.*) With regard to the prevention of accidents from falls of roof and sides, you think they could be prevented, first, by adopting systematic timbering in gateways and roadways which are in close proximity to the working face, and are, therefore, not thoroughly settled?—Yes.

23782. What do you mean by systematic timbering?—By systematic timbering I mean setting timbers at a certain specified distance, whether the roof is hard or soft.

Mr. Walter Marriott.

26 June 1907

23783. Who is to specify the distance?—The manager.

23784. Would you leave it entirely to the manager to specify the distance?—To the manager and the inspector of the district.

23785. Do you suggest the manager and inspector of the district should consult with the men, or not?—I do not think they should.

23786. You think the manager and the inspector of the district should settle the maximum distance between the props?—Yes.

23787 In regard to the particular kind of roof that they have to safeguard?—Yes.

Digitized by Google

Mr. Walter Marriott.

26 June 1907

23788. In the same mine you might have a different maximum distance for different classes of mining ?—Yes. I may say we have a systematic timbering along the face.

23789. I do not know whether these Special Rules apply everywhere, but I think they do apply t any rate to the mines that are looked after by your Association, and for a long time it has been the practice to say that a maximum must be settled ?—Yes ; that applies to our Association but only along the coal face, the working face. This systematic timbering which we propose is in the gateways and the roadways leading from the working face.

23790. Your complaint is that there is no Special Rule as to systematic timbering in the gates ?—Yes.

23791. Would you be content if the Special Rules which are now in force with regard to the working faces were put in force in regard to the gateways as well ?—That would content us.

23792. That is, that the manager shall keep posted up a notice specifying the maximum distances ?—After consultation with the inspector.

23793. Would you suggest that the rules should be strengthened by bringing in the mines inspector as well as the manager ?—Yes.

23794. You would say that the manager, in order to specify the maximum distance, should consult with the mines inspector ?—Yes.

23795. And should the mines inspector be able, in case of disagreement, to fix a maximum distance himself, over the head of the general manager ?—Yes, I think he should.

23796. You think he should be the supreme person to decide ?—Yes.

23797. Both with regard to the working faces and the roadways ?—Of course, the working faces are settled to a great extent.

23798. Between the manager and the inspector ?—And the men. The manager posts up the notice of the maximum distance between the props, and that has to be carried out, whether the roof is hard or soft. I am not aware that there has ever been any dispute, after the manager has posted the notice, with regard to the men carrying it out.

23799. The present system of Special Rules with regard to the working faces works quite satisfactorily ?—Yes, on the working faces.

23800. And all you desire is that the same Special Rules should apply to the roadways as well, and that is all ?—Yes.

23801. You think that safety might be increased by leaving more to the discretion of the stallman as to what timber it is very dangerous to withdraw from the wastes or gob ?—Yes.

23802. Will you explain your views as to that ?—Well, this is actually what takes place : the stallman is selected for his practical knowledge and his qualification for looking after the safety of the mine so far as setting timber is concerned, but when it comes to the withdrawal of the timbers from the gobs there is no discretion allowed to the workman, the timber must come out. We have cases where the manager or the deputy knows it is practically impossible to recover that timber, but it must be cut, and allow the roof to fall. We contend that that is an unnecessary danger.

23803. How do you mean that it must be cut or withdrawn ?—There are certain cases where the roof is so heavy that when you take the props out by any means the roof falls and immediately bursts down. The stones are so large that it is impossible to withdraw the timber, and the result is that the prop has to be buried eventually. But we must take it from under the roof ; we must cut it out, although the management knows it is going to be buried immediately that we take the weight off.

23804. I do not understand how there can be any "must" about it ?—Well, it is so.

23805. (*Mr. Ratcliffe Ellis.*) This is withdrawing the timber after you leave the face ?—Yes. It is in the waste.

23806. Why do you want it to remain ?—Because in certain cases it is too dangerous to withdraw it.

23807. (*Chairman.*) You think in some cases it is so dangerous to withdraw the props that they should be left where they are, in the waste ?—Yes.

23808. Are there not any means of withdrawing the props which prevents the withdrawal being dangerous ?—Yes.

23809. (*Mr. Ratcliffe Ellis.*) Have you not a gablock and chain for the purpose of withdrawing it ?—Yes.

23810. (*Chairman.*) You mean the mere process of withdrawing is dangerous ?—Yes.

23811. And as it cannot be withdrawn without being dangerous it should be left alone ?—Yes, we contend it should be left alone.

23812. (*Mr. Enoch Edwards.*) You are pleading rather that the men in charge should have some discretion ?—Yes.

23813. (*Chairman*) I understand that there is a particular man whose duty it is to use this gablock and chain in withdrawing the props ?—Yes, the stallman.

23814. Does he do anything else besides that ?—Yes, he has to do the work of coal getting.

23815. He is deputed to look after the props as well as to get the coal ?—Yes.

23816. He is not in any position of authority ?—No ; he is an ordinary collier, the principal man in charge of the stall.

23817. (*Mr. F. L. Davis.*) Every collier is in that position, is he not ?—Not every collier. There are, perhaps, two contractors or stallmen in charge of two or three others, and, in some cases, more—it depends upon the length of the stall and the speed the company want it to proceed at. In some cases there will not be more than two or three men besides the contractor, and in other cases there will be 12 or 14 men.

23818. (*Chairman.*) How many of the 12 or 14 men would have authority to withdraw the props ?—Two.

23819. There are always two in such cases ?—Yes.

23820. What do you say with regard to the prevention of accidents on haulage roads ?—I think you divide your evidence into two parts, viz., where the haulage is done by horse, and where it is done by endless ropes. First of all, what do you say with regard to horse haulage ?—I think that wherever the haulage is done by horses the road ought to be of sufficient width to allow the lad or the driver to pass freely along at least one side of the tubs the whole length of that road.

23821. Have you known any cases where the road is of sufficient width and where it has been blocked up, except, of course, at the entrance to the manhole, in such a way that it would be difficult for a man to walk along ?—Yes, any number.

23822. It is necessary by law that the manholes should be kept free ?—Yes.

23823. You say whether it is necessary by law or not, it is not the case that the side path is always kept clear the whole length of it ?—Yes, and we think it ought to be compulsory that the whole length of the road shall be of sufficient width to allow the driver to pass by the tubs.

23824. And that the whole of that path at the side, which must be of sufficient width, should also be kept clear, so that any man could at once step off from the middle of the road to the side without any obstruction, if he saw anything coming ?—Yes.

23825. That, you say, is not the case ?—Yes.

23826. Even where it is of sufficient width there are often such obstructions by the side that the man could not step off into safety at once ?—Yes.

23827. You think that should be remedied ?—I do.

23828. First of all you want the road to be of sufficient width to allow a pathway on one side ; and, in consequence, you want a rule that that path should be kept clear ?—Yes.

23829. Have you any other suggestions to make with regard to horse haulage ?—No.

23830. Now what do you say where the haulage is done by endless ropes ?—Where the haulage is done by endless ropes we want a system of clipping or attaching the trams to the rope that is safe to be taken off and put on. We have systems that we do not consider safe. I have brought you drawings here of two different kinds of clips, both in use in our immediate district, one of which we consider a fairly safe clip, and the other we think is a dangerous clip.

23831. Can you point to any statistics of accidents to show that one is safe and the other dangerous ?—I cannot point to statistics, but I know accidents are continuously happening at our own colliery.

23832. You say they are happening continually where one kind of clip is employed, and not where another kind of clip is employed ?—Yes.

23833. (*Mr. F. L. Davis.*) Is this a clip between each tram ?—No, it is between the trams, or the run of trams, and the ropes.

Digitized by Google

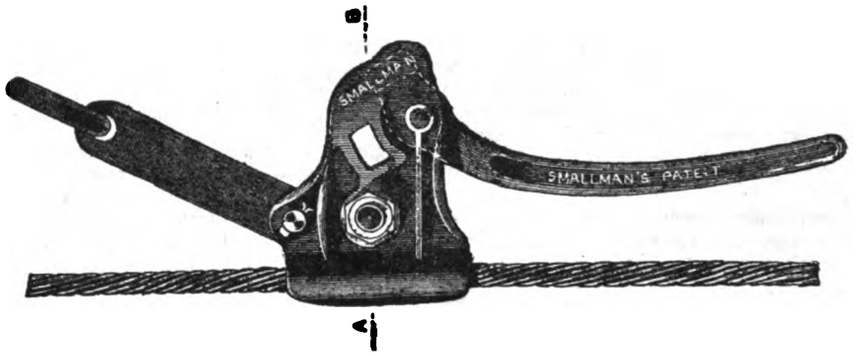

Fig. 1

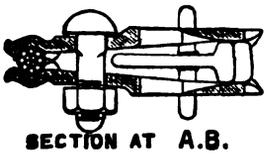

Fig 2.

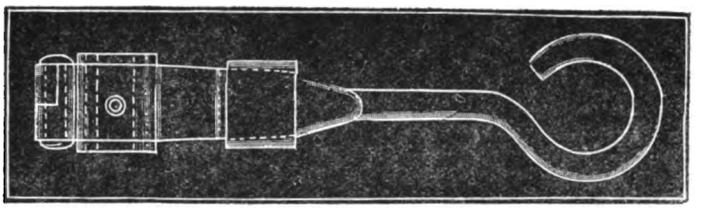

Fig. 3.

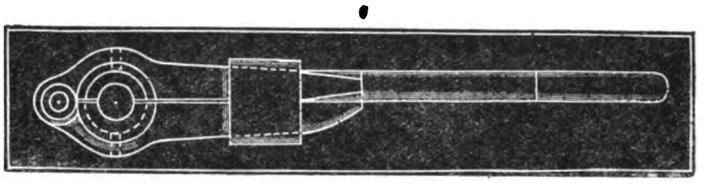

Fig. 4

23834. (*Mr. Smillie.*) It takes the place of a bogey ?—Yes.

23835. (*Chairman.*) You put in the drawing of a clip which you consider to be safe ?—Yes; the Smallman clip (Figs. 1 and 2) is what I consider safe, and the Fisher clip (Figs. 3 and 4) is what I consider dangerous. I think where haulage is done by endless ropes, which practically means having a double road or a road for the empties and a road for the full ones, that the roads ought to be of sufficient distance apart to allow a person to stand between the trams. There are many accidents happening through people being crushed between the two trams passing up and down.

23836. You would not consider it sufficient that a man should be able to step aside when he sees trams coming, but you say where there is a considerable number of trams coming in different directions along the same road the gangway between the trams ought to be wide enough to enable a man to stand there in safety ?—Yes, and for this reason: at these junctions where the trams are clipped or coupled on to the rope, at the moment that the clipper-on or the boy is attaching the full or empty tubs to the ropes, whichever it may be, there is perhaps a run of trams coming down on the opposite road, and there is no room for him to stand between, and if he steps from before the trams he is clipping on he more than likely steps before the trams coming in the opposite direction, and therefore gets run over. We think the roadway ought to be of sufficient width at those points that the clipper-on can stand between the two runs of tubs safely.

23837. If you had a gangway between the two lines of trams it would not be necessary to have another path on the other side—or do you think there should be a path on each side, and a gangway in the middle ?—It applies to two different roads.

23838. You would not want a pathway on the side of each as well as a gangway in the middle ?—No.

23839. The gangway in the middle would take the place of the path at the side ?—Yes.

23840. What do you say about accidents arising from trams running away in consequence of getting ropes or chains broken ?—I think there should be backstays or drags used to every run of tubs.

23841. Would you say that the manager should have no option in the matter, and that whenever a full load is drawn you should have that arrangement ?—Yes.

23842. You say it should be compulsory in every case ?—Yes.

23843. It should not be left to the management to decide ?—No.

23844. Have you anything else to say about haulage accidents ?—No.

23845. With regard to shaft accidents; first of all to deal with the question of preventing men from falling or being thrown off the cage whilst descending or ascending, what do you say with respect to that ?—We believe that wherever a cage is used for lowering or raising persons there should be a door across the whole width to prevent persons being thrown out of or falling from the cage. At present at many of our collieries we have simply a bar put across, which simply drops in a slot, and the result is very often that the men riding up and down put their hands on that, and if anything happened in the shaft it is more than probable that their hands would go up, and the bar would go off. But if nothing takes place, then the bar is at least a yard from the bottom of the cage, the cage bottom is composed of steel or iron plates, and if the cage gets into an inclined position it is very liable to throw the men off. We contend that such a terrible thing as a shaft accident takes away the presence of mind of the man for the time being, and even if he had hold of the side rods provided, it is more than probable that the jerk of the accident would cause him to take his hand off that rod, and he would be shot down the pit shaft, which happened in the "Shirebrook" case not long ago. We contend that wherever a cage is used for lowering or raising persons there should be a gate across to prevent men falling or being thrown off.

23846. The protection you suggest is a gate at the side of the cage ?—Yes.

23847. How do you deal with the matter of preventing cages from falling down the shaft in the case of over-winding ?—Well, it is not to prevent cases of over-winding, but it is to prevent the men from falling down the shaft again after they have been over-wound. What we think should take place is this: it ought to be made compulsory that there should be a set of props fixed up in the headgear, not more than two feet away from the bottom of the cage, when the King's Patent, as we call it, or the detaching hook goes through the King's Patent—because when over-winding takes place it is very probable that the cage is going at a terrific speed, the chains are slack, and the weight of the cage gives the falling back a terrible force, which is liable to break the King's Patent, or allow the cage to go back on to the props at the surface. We contend if props were put on the headgear which were constantly in, as soon as the cage went through the props would shoot in in a case of over-winding, and catch it before it has got the terrific force it has in falling to the surface.

Mr. Walter Marriott.

26 June 1907

23848. Your suggestion is that if the cage gets over-wound those props would immediately, by some mechanical contrivance, prevent the cage falling down any great distance?—No, not by any mechanical contrivance, but they should be permanently fixed up in the headgear, not more than two feet away from the bottom of the cage.

23849. (*Mr. Ratcliffe Ellis.*) It is to prevent the cage going down the pit?—Yes.

23850. (*Chairman.*) Some contrivance by which, at all events, if the cage is over-wound, it should be only able to fall back a very small distance?—Yes.

23851. There are other contrivances which automatically decrease the speed of a cage in the case of over-winding—that when it gets to a certain height the speed is automatically slackened, and the over-winding can be prevented?—I have read about them, but I have never seen them in use. We are of opinion that if it is possible to secure such an arrangement it ought to be compulsorily applied at every colliery.

23852. (*Mr. Ratcliffe Ellis.*) You think it would be better to prevent over-winding than to minimise the mischief of over-winding?—Yes.

23853. (*Chairman.*) You know yourself of a fairly good contrivance to minimise the effect of over-winding, but you have no personal experience of the other kind of machine?—No.

23854. So that you cannot express any opinion as to the efficacy of the machinery which prevents over-winding, but if it could be done you think that would be the best means of dealing with the matter?—Yes.

23855. Have you anything to say about reducing speed when winding men up and down?—Yes, I can speak of that from practical experience. In our modern collieries to-day they wind men at such a terrific speed, when the cage starts from the bottom during the first half of the winding, that it requires a man with very good knees to stand the terrific pressure applied. Then after they pass what we call the meeting place, or the centre of the shaft, the speed should begin to be reduced.

23856. Rule 26 of the General Rules is: "If in any mine the winding apparatus is not provided with some automatic contrivance to prevent over-winding, then the cage, when men are being raised, shall not be wound up at a speed exceeding three miles an hour after the cage has reached a point in the shaft to be fixed by the Special Rules." You say that in all cases there should be some rule preventing cages from going beyond a certain speed while men are being wound up?—What we find from practical experience is this: during the first half of the winding they gain a terrific speed, and the result is that during the second half of the winding they appear, from what we can judge as practical men, to have to turn the steam against the engine on purpose to stop, for the simple reason that they have the great weight of the rope going down pulling against them, consequently in the second halt the cage proceeds in a very jerky manner. We think you would be able to get expert evidence to say what speed should be allowed when they are winding men.

23857. Your Association has no opinion to give as to the limit of speed?—They have no expert evidence.

23858. They want expert evidence taken on that matter?—Yes.

23859. So as to prevent the unpleasant jerks which might be harmful to the men?—Yes.

23860. You complain of the jerks?—Yes.

23861. But even then during the first half the men are in a very uncomfortable position?—Yes, in a very uncomfortable position. It is a very anxious time for the men when they are being wound up and down the pit shafts, and we think the speed should be such as to reduce the danger to a minimum when winding the men.

23862. I thought your suggestion was that it might be so uncomfortable to the men as to injure their health, or do their muscles some harm?—That is not what we complain of altogether; but we suggest that when the speed is so great that it is causing discomfort it is also dangerous.

23863. In what way do you say it is dangerous?—We say it is dangerous through going at the terrific speed they do. Accidents are very liable to happen in the shaft.

23864. Do you remember what the three accidents were which have been reported in the last ten years in the Midland District, and what they were caused by?—I do not know what they were caused by, but we wish to prevent accidents. We do know that the accidents are not numerous, but we wish to prevent even those that do take place in shafts.

23865. You have no evidence to show, from any actual accident happening, that the mere pace of a cage has caused an accident, irrespective of over-winding?—No.

23866. Do you want to say something on the everloading of cages when men are being raised or lowered?—We think the law should be altered so that it is left to the discretion or the judgment of the inspector for the district for the time being instead of the manager.

23867. As to how the men should go down in the cage?—Yes.

23868. Would that not be a question on which the men might very well appeal to the inspector?—Perhaps it would: still, we think it ought to be put on a proper footing.

23869. Have they not appealed to the inspector on that question?—I think not.

23870. (*Dr. Haldane.*) Is there not a maximum limit to the number of men to each deck of the cage?—Yes, there is a maximum, but it is left to the discretion of the manager, and the result is that very often the maximum is placed at such a number that it is practically impossible to jamb the men on to the cage.

23871. (*Chairman.*) Is it not also the case that where the management have suggested the maximum number, the men very often of their own free will go up and down in much greater numbers?—That may be so; but even if they wish to commit suicide you should have a right to prevent it.

23872. You say that these Rules, as to the number of men that might be taken up and down in cages, buckets, and so on, should be subject to the sanction of the mines inspector. Is that your suggestion?—Yes, it should be left to the inspector to say what number of men should be allowed to ride on certain cages in his district.

23873. That comes to very much the same thing; the management would probably suggest the number, and they would go to the inspector and say that that was the number they suggested, and ask whether the inspector agreed?—Yes.

23874. What work are you doing now?—Stall-man.

23875. You are yourself a stall-man at the present time?—Yes.

23876. You have practical experience with regard to the withdrawing of the props?—Yes, every day.

23877. What mine are you employed at?—The Pleasley Mine and the top hard seam.

23878. What other seams?—I have worked in the black shale or the Silkstone seam, and the soft coal and the Waterloo seam.

23879. Always in the same mine?—Not in the same mine—in different parts of the county.

23880. Therefore you have very considerable knowledge of the customs of Derbyshire mines?—Yes.

23881. (*Mr. Ratcliffe Ellis.*) What is the name of your colliery?—The Stanton Coal and Iron Company.

23882. With regard to the timbering, you think that an inspector ought to prescribe the distances both at the face and in the roadway?—We are not complaining about the face at all, it is the roadways.

23883. The inspector does not prescribe the distances at the face?—It is put in the Special Rules.

23884. The Special Rules say that the manager is to prescribe the distances, not the inspector?—Yes.

23885. You are satisfied with that?—Yes, we are satisfied with that.

23886. Is not the face the more dangerous place, with reference to the timbering, than the roadways?—I do not know that it is much more dangerous than the roadways immediately in the vicinity of the face.

23887. You are aware no doubt that there are a larger number of accidents happening at the face, in consequence of the timbering or the falls of roof and sides, than in roadways?—Yes.

23888. If you are satisfied with the system which enables the manager to prescribe the distances at the face, why should you not be satisfied that the manager should prescribe the distances on the roadways?—For this reason, at the face in our district the work is done by the stall-man. Immediately we take the roof down after the ripping, as stall-men and contractors getting coal, we have done with

Digitized by Google

our responsibility; and after that time the roadway is allowed to what we call "gutter up"; the middle falls out and the sides become dangerous. That is the reason we think systematic timbering should be applied.

23889. That is not quite the point I am asking you about. Systematic timbering means, as I understand, that whatever the nature of the roof may be, props must be set at a certain distance?—Yes.

23890. At the face the manager prescribes the maximum distance?—Yes.

23891. If you had the same regulation to apply to the roadways, why should not the manager also prescribe the distance?—That would be all right, provided systematic timbering was compulsory.

23892. I am dealing with the inspectors. You would leave it to the manager to prescribe the distance?—No, I think the inspector should be consulted in this case.

23893. You say the arrangement is perfectly satisfactory at the face where he is not consulted. Why should not the same safety be secured on the roadways without consulting the inspector?—In the first place I do not know that the inspector was not consulted at the time the Special Rules were framed.

23894. The Rules do not provide for his being consulted; it is the manager?—I think that the rules ought to be applied by the inspector and left to his discretion.

23895. In respect of this timbering?—Yes.

23896. If that is so, would you then relieve the manager from his responsibility?—Yes, if he carried out the instructions of the inspector.

23897. Do you think the inspectors would undertake a responsibility of that sort?—I do not know that. I suppose if it became law they would have to undertake the responsibility.

23898. However, that is your view; that for the timbering both at the face and in the roadways the inspector should prescribe the distances at which the props should be put?—Yes.

23899. Why are you not satisfied with the state of things at the face now?—We are satisfied with the state of things at the face.

23900. Why do you wish to bring the inspector in for that?—We do not want to bring him in, only we say we are of opinion—or we do not know of any other opinion—that the inspectors were consulted when the Rules were framed, therefore we think they should be left the discretion in saying the maximum that timbers shall be applied in the gates.

23901. You have no statistics as to the number of accidents that happen from falls of roof and sides in your roadways?—No.

23902. Are there many?—Yes.

23903. When was the last?—They are continually happening; and the unfortunate part of the business in getting to know the statistics is that they are not all returned to the Government.

23904. When was the last you know of in the roadways?—Not more than a fortnight ago.

23905. In your district you have a very good record, as you know, no doubt, as to accidents from falls of roof and sides?—Yes.

23906. You think it might be improved?—We think that we should be able to get at the bottom of the thing a good deal better if it was made compulsory to report all, which I suppose is going to be done.

23907. That is another question; but matters, good as they are, you think would be improved upon if this suggestion of yours was carried out?—Yes.

23908. With respect to the haulage roads; what is the width generally now on your horse-haulage roads?—The widths vary from 9 ft. to 12 ft. when they are packed out, but during the course of time the packs are pushed in. Falls of roof continually occur in the roadway, and instead of the dirt being moved completely away, it is packed up at the side, and therefore the roads become so contracted that it is practically impossible for a lad to get by the sides of the trams.

23909. To start with they are right?—Yes.

23910. What width are they now generally?—Not more than 3 ft. 6 in. or 4 ft. in width in some places.

23911. That is because you say the stuff coming down has not been taken out, but is packed along the road?—Yes, and the result of the weight pushing the packs until closing them in.

23912. You think so far as the horse-haulage roads are concerned, there should be room made on one side—or do you say both?—On one side.

23913. For a sufficient passage?—Yes.

23914. There is not now?—No, there is not now.

23915. Is that generally so throughout the different seams of the colliery?—It applies to a good many mines. Of course there are some roadways where there is room, but there are others where there is no room for a lad to pass properly.

23916. Are you speaking now entirely in reference to the Stanton colliery?—Speaking entirely of that district; as I say, at some there is room and at some there is no room.

23917. That room might be given without doing anything more than removing the débris which is coming down, and is now packed up at the sides?—Yes.

23918. That is, taking the stuff out of the pit or taking it into the stalls?—Yes, into the stalls.

23919. Where mechanical haulage is used, then you prefer a gangway, apparently, to this room at the sides?—Yes.

23920. It is only when the tubs pass each other that that gangway would be wanted?—That is all.

23921. What is the width of your mechanical haulage road now?—8 ft.

23922. Is that 8 ft. maintained?—Yes.

23923. What width do you say it ought to be?—At least 10 ft.

23924. If you had the passage alongside of 2 ft., you could get it with your present 8 ft.?—I do not think so. Our trams are a little over a yard wide and there has to be a space allowed at either side because it is not possible to get the road perfectly straight and free from abutments. You cannot gauge an underground roadway to an inch.

23925. In order to make the 8 ft. roads into 10 ft. roads what work would have to be done?—They would have to be made and kept wider from the start. They are packed out properly at the start, but they are allowed to get contracted.

23926. When originally made they were 10 ft.?—Yes—some 12 ft. or 14 ft. wide.

23927. And they have become contracted until you think they are too narrow now?—Yes.

23928. Now as to the different kinds of clips and shackles. You want something which will stand the strain better than what you have got now?—That is not it alone; we want something that is not so dangerous during the operation of clipping the tubs on to the rope.

23929. What appliances have you now?—We use the Fisher clip.

23930. So far as standing the strain is concerned, do you have many breakages with those?—No.

23931. So far as the one is concerned which you use, it is satisfactory?—Well, sometimes there are breakages, of course.

23932. You prefer No. 1* clip because it is more easily applied?—Yes.

23933. No. 2† is used, and so far as standing the strain is concerned, it is satisfactory?—Yes.

23934. But it is not so easily applied?—It is easily applied, but it is more dangerous during the operation of application for the simple reason you will see that the hook is hooked into the drawbar of the tram, and the result is the lad, when bending down in this way, before the tram, has not more than 15 inches of the whole length of that clip; and if the rope is rather low for the clip to be applied properly he has to hold the rope up with his toe to get it into the exact position, which you see, in the grooves; and the result is that the moment he puts the loose box down the tram is going at full speed. We consider that it should be made in such a form that the lad could stand away from the front of the tub, and be in a more upright position, and therefore have a better chance of getting away.

23935. Is there any disadvantage in having a trailer at the end of each gang?—I do not think so.

* See Figs. 1 and 2, page 118.

† See Figs. 3 and 4, page 113.

Digitized by Google

Mr. Walter Marriott.

26 June 1907

23936. It is not wanted on the level ?—No.

23937. It is wanted on the hill ?—Yes.

23938. In case of breakage there is a sort of clutch ?—Yes.

23939. You see no reason why that should not be always applied when going up the incline ?—If they were all on the rope, much the same as ours. In some places it is practically flat and in other places it rises. When the run of trams is connected to the rope I do think the back-stay ought to be put on and kept there until it has ended the journey.

23940. As to the gates on the sides of the cages, do I understand you to say you want them on the two sides of the cage ?—On both ends.

23941. The ends are protected at present ?—No, it is the ends we want them on.

23942. The sides are protected ?—Yes.

23943. When you put the tubs into the cage at the bottom or took them out, what would you do with the gates ?—The gates should be made as folding gates. You can see very suitable gates for the purpose on the lifts at hotels. The gate I mean is a gate which folds up into a space not more than 6 inches in width, and not more than about 1¾ inches in breadth, and it can be easily pushed back on each side of the cage.

23944. There is not much time lost in getting the tubs in and out on the top of the pit ?—That is so.

23945. Is the gate which you suggest made of iron ?—Yes.

23946. Is it collapsible ?—Yes.

23947. Who is to move it on one side ?—In the case of winding coal it would not be necessary to have the gates across at all.

23948. Then it would not interfere with the operation ?—No.

23949. But when you are winding men you think the gates should be closed ?—Yes.

23950. You have seen something up here which might be fastened to a cage ?—It simply collapses up. It is a lattice-work gate, and it folds up into a very small compass.

23952. Do you not think that that would get knocked about rather ?—I do not think it would. It could be easily pushed back to the side of the cage and left there during the operation of winding coal, and when they wanted to wind men it could be unfolded and brought across the cage.

23953. Are there many accidents happening from men falling out ?—No.

23954. Do you think there is a source of danger there ?—Yes.

23955. And speaking with your friends about it you think it is a danger against which you would like to be protected ?—Yes.

23956. What speed do you think should be the limit in winding men ?—As I have said, I am not here to give expert evidence.

23957. It is very difficult to say what speed you are going at, is it not ?—Yes, when you are going up a pit shaft.

23958. You think after the passing place the weight of the rope, and so on, accelerates the speed of the cage, and when they require to stop it causes the cage to jerk very much ?—I do not think the weight of the rope is causing it altogether; it does assist because it is a balance against the engine; but, in our opinion, the cause of the jerking is because the speed is so great, and in order to make it possible to stop at the top the steam has to be turned against the engine in the second part of the winding, and that causes the cage to jump.

23959. Is there any greater danger in being wound fast than there is in being wound slow ?—I should say there is a greater chance of the conductors breaking, where they are wood, and also the slides giving way.

23960. You do not find that often takes place ?—We do not get statistics to show when a cage does get out of the conductors. Such cases are not reported.

23961. Have you yourself known of such a case ?—Yes, but not when I have been in the cage. It occurs in the case of coal winding continually.

23962. However, your view is that that is because of the speed ?—Yes.

23963. You think that there should be a limit to the speed when men are being wound, but you are not prepared to say what that limit should be ?—Quite so.

23964. Again, you think that the inspector should approve the number of men who should be wound up and down ?—I do.

23965. What is the maximum now that you know of ?—The maximum number at our colliery is 18 at one shaft and 16 at the other.

23966. It is more than that in some cases, I believe ?—Yes, I believe it is.

23967. Do you think that is too many ?—Yes, for the size of the cage. Our cage where they are winding 16 at a time is over-crowded; and if they happen to be big men a man's back is not in a very comfortable position, when they put the bar on it after the last man.

23968. Everybody is anxious to get down, and more anxious to get up ?—I grant that.

23969. There is difficulty sometimes in keeping order, especially in coming up the pit ?—Yes.

23970. At any rate, you think a maximum number should be prescribed by the inspector ?—Yes.

23971. (*Dr. Haldane.*) Is that number 16 in each deck ?—No, we only wind men on one deck.

23972. (*Mr. Enoch Edwards.*) How long have you worked at the pits ?—I have worked in the pits since I was 13 years of age and I am 41 years of age now.

23973. Has all your experience been in Derbyshire ?—Yes.

23974. You have not worked in the gassy seams ?—Yes, I have worked in the Silkstone seam in Derbyshire.

23975. With reference to the over-crowding of men in the cage, you suggest that that is a matter which should be left to the inspector ?—Yes.

23976. Do you mean the inspector should issue some sort of order ?—I mean the inspector knows the size of the cage, and it should be left to him to say what number of men should ride on the cage in that colliery.

23977. He should fix a number ?—Yes.

23978. You do not suggest he should be there to see it carried out ?—No, he should make a rule.

23979. At your pit you draw 16 at a time ?—18.

23980. Is there proper capacity on both decks to carry 18 ?—16 is at one shaft and 18 at the other.

23981. They are all on one deck ?—Yes.

23982. Have you double deck cages ?—Yes.

23983. They do not use both decks at the same time ?—No one rides on the top deck.

23984. There again, that is different from what takes place in many parts of the country, because at some places no one rides on the bottom deck ?—That is so, I know.

23985. You think with 18 it is over-crowded ?—No, I think that the 16 cage is less than the 18 cage, and therefore I think the 16 men on that particular cage are more over-crowded than the men are even on the 18 cage.

23986. (*Dr. Haldane.*) Why do the men not ride on the top deck ?—Well, it has never been the rule at the colliery.

23987. (*Mr. Enoch Edwards.*) At some they ride on all decks. I saw, myself, at one place, 32 men going down and 32 coming up against them ?—Yes, and there will be a "ship-wreck" if ever a cage accident happens.

23988. You think that should be brought to the notice of the Government inspector, and he should fix it ?—Yes.

23989. As to systematic timbering, I understand you to say that part of the contractor's contract is that he should do the timbering at the face ?—Yes.

23990. And then when he leaves it is no longer his obligation but the company's obligation ?—Yes.

23991. Did I understand you to say that the roads when originally made were from 9 to 12 ft. wide ?—Yes, 9 to 12 ft. wide.

23992. Did you tell Mr. Ellis, in answer to his question, that they are only now about 3 ft. wide ?—Yes, 3 ft. 6 ins. to 4 ft.

23993. How long a period does it take to squeeze the roads up into that small compass ?—It is not a matter of squeezing up; it is a matter of packing the falling roofs and the sides. Of course, the squeezing process assists in contracting the roads, but whenever a fall of roof occurs, in-

Digitized by Google

stead of the dirt being removed and stowed away somewhere, it is stowed up at the sides, if there is room for the tram to go past.

23994. They could keep the main road much wider ?—Yes.

23995. You suggest that if the road was left by you when finished, 9 to 12 ft., there is ample room for the men to form a foot road outside the tramway ?—Yes.

23996. So that it is not so much a question of making the road as keeping it ?—That is it.

23997. These mines, which you refer to, are mostly flat?—They rise about one in twelve—they are practically flat mines—but some parts of our collieries rise more than that.

23998. As to the speed of winding, I understand you to say that your experience is that there is too much steam put on to start with, and they run too quickly after they come to the halfway junction ?—Yes.

23999. Have they ever explained to you the object of running so quickly ?—I suppose it is to get the men out as quickly as they can.

24000. If your view is taken of it I suppose it will take much longer both in letting men in and letting them out ?—Yes.

24001. Is there not sufficient time allowed to get the number in or out ?—At night there is any amount of time, and, of course, that does not apply then ; but in the morning we find we have workmen's trains running in, and if the train happens to be late, and there is a large number of men coming later than they ought to do at the pit top, the result is that they go down quicker than usual.

24002. The difficulty I understand you to suggest all along is, when you are coming up the pit ?—Yes.

24003. How does it apply when you are going down the pit ?—It applies in the same way.

24004. As an experienced collier, you say a man is rather more sensitive when being lowered down in the morning ?—He is glad to get up at night.

24005. The effect on the men of letting them down too quickly would be more serious than winding them up too quickly ?—Yes, I have no doubt it would.

24006. However, you think that is done sometimes because these trains are late ?—Yes.

24007. (*Mr. F. L. Davis.*) You told Mr. Ellis you thought the inspector ought to fix the distances in the gateways and roads ?—Yes.

24008. And, I think, you also said that the stallman ought to have some voice in drawing out the timber ?—Yes.

24009. Supposing that to take place, what would happen ?—I have no doubt, in some cases, some of the timber would be left.

24010. You say he should have some voice in it ; but supposing he and the manager disagreed as to whether that timber should be left or drawn out, who is to decide between them ?—I do not know who is to decide then. But I say this, that no man knows better the nature of the roof than the man actually working in it ; and he knows when timber is impossible to be got out. Even when it is taken away from the roof the roof falls and buries it, and it has to stop after all the danger has been run.

24011. Do you suggest where that applies that managers will insist upon having that timber drawn out, although they know it is bound to be buried and cannot be made use of afterwards ?—I would not say the manager, but the instructions which apparently come down to the deputies and assistant-deputies are, that all timber must be drawn—and the timber has to be drawn, and is drawn, or otherwise if not drawn, it is simply cut away from the roof, and the roof falls and buries it.

24012. You do not suggest it is nearly always buried ?—No ; I suggest in certain cases it is buried.

24013. Occasionally it is buried ?—Yes.

24014. The deputy tells you, in his opinion, you must take it out ; he thinks it will not be buried, and he will be able to save the timber ?—In some cases he knows perfectly well it will be buried.

24015. You say that is not general, but in some cases it is so ?—It happens continually in our working experience.

24016. What do you suggest should be done ? You say the stall-man should have some voice in the matter as to whether it should be drawn or not ?—Yes. I say when a stall-man can give satisfactory evidence that it is unsafe to draw that timber, it should be left to his discretion to let it stop.

24017. And the manager or deputy have no word in it at all ?—No.

24018. (*Mr. Ratcliffe Ellis.*) You have no Special Rule about the withdrawing of timber at all, have you ?—No.

24019. (*Mr. F. L. Davis.*) Have you ever heard of any accident arising because there was a gate at the end of the cage, and the men not being able to jump out ?—No.

24020. I believe there was a case where an accident did happen because of that ?—I do not know of it.

24021. As to this jerky action of the cage, in consequence of turning the steam against the engine, do you say that is a thing which is happening constantly, or is it an occasional thing ?—It is happening constantly.

24022. If it does, does it not put a great strain both on the rope and on the engine ?—Yes, we believe so.

24023. Is that not, in your opinion, against the interest of the management ?—Perhaps it is.

24024. I cannot help thinking you must be exaggerating it a little ?—No, I have not come here to exaggerate ; I have come here to give my practical experience.

24025. I cannot understand any manager, in his own interests, allowing that state of things to happen where there is a constant jerk like that on the rope ?—The jerk is not such as the bull chains, for instance, getting slack, but it is the reducing the speed and then going off again.

24026. (*Dr. Haldane.*) Can you see whether there is a jerk on the drum ? The drum is not jerking, is it ?—I do not know. I have not been in the engine-house ; I am on the cage.

24027. (*Mr. Enoch Edwards.*) It is the cage that is jerking ?—Yes.

24028. Is that not because the rope is like a piece of elastic, and it gets a little longer and a little shorter ?—I do not think so. I do not think it is a case of expanding the rope.

24029. (*Mr. F. L. Davis.*) I should have thought, if it is as you describe it, the managers would soon find out it was not to their interest to wind in that way, because it seems to me there would be severe strain on the engine and the rope ?—Well, it is so.

24030. (*Mr. Enoch Edwards.*) It perhaps does not jerk the manager when he is going down ?—Perhaps that is it.

24031. (*Dr. Haldane.*) You notice the jerking just as the cage is starting at the bottom ?—No, it is not that, it is simply in the second half of the winding. They simply take you up, on some of the modern cages, as if you were going to heaven.

24032. I thought you said the jerk was just at the start ?—It is simply in the second half of the winding.

24033. (*Mr. F. L. Davis.*) They start you like starting a train, do they not, with scarcely any feeling of movement, and then increase the speed quickly ?—Yes, and very quickly.

24034. But without any jerk to start with ?—Yes. If you stand against any of the engine-houses with these powerful modern engines, you will observe that when they get within a short distance of the top the engine simply begins to give a cough with the steam being turned gainst it. In my opinion, that is what takes place.

24035. (*Mr. Smillie.*) That is done when they are winding coal just the same as when they are winding men ?—Yes.

24036. (*Mr. F. L. Davis.*) I was going to ask you this question : do you think that this takes place in the same way when winding coal as when winding men ?—Yes, I have no doubt it does, and perhaps more so.

24037. I do not quite understand it, I am sure. If it is constantly going on there must be a tremendous strain both on the rope and on the engine ?—There is just this in it, when they are winding coal there is perhaps from two to three tons of coal on the front cage, and on the end cage there is only the empty load, and the result is when it gets towards the top that coal helps to have a steadying effect upon it—whereas winding men it is not so heavy.

24038. You suggest that the inspector should state the number of men to be taken in each cage in his district ? Yes.

24039. Would that not be putting some new responsibility on the inspector ?—Yes.

24040. Which he has not got at present ?—It would do so.

24041. Do you think he would like that ?—Well, I do not suppose he is different from anyone else ; he does not

Digitized by Google

Mr. Walter Marriott.

26 June 1907

like more work put upon him, but even if he did not like it, as I say, if it was passed into law he would be obliged to do it.

24042. I do not mean that the inspectors would object to the work, but object to having the responsibility, and in that way taking the responsibility off the manager ?—I do not see that he would take the responsibility off the manager of the mine, if he gave instructions for a certain number to be taken at a certain colliery. The responsibility of the manager would remain just the same, to see that not more than that number went.

24043. You would have him take upon himself the responsibility of fixing for each colliery how many should be wound ?—Yes.

24044. (*Mr. Enoch Edwards.*) They need only fix it once ?—That is all.

24045. (*Mr. Smillie.*) In addition to your practical experience, do you hold a certificate of competency ?—Yes.

24046. I believe you hold a second class manager's certificate ?—Yes.

24047. Have you, during your experience underground, ever seen a Government Inspector making an inspection of the mine ?—Yes.

24048. How often do you remember that having taken place ?—Not very often. You come in connection with him seldom, but very often he is in a district when you are not there. I have not seen a Government Inspector for a long time, but it has not been because he has not been round the district, but because I have not happened to be present when he was making the examination.

24049. If a Government inspector in making his examination found any part of the mine unsafe—a bad stone hanging, for instance, and instructed the manager to put that right, do you think that would be taking the responsibility off the manager ?—No, I do not think it would. I think if he ordered it to be put right, it would be the duty of the manager to put it right.

24050. Do you not think it would be the duty of the inspector that he should instruct the manager to put it right ?—Yes.

24051. But you do not think that would be taking the responsibility off the manager ?—No.

24052. In the same way if he attended to the gateways and roadways, as you have explained, that would not be taking the responsibility off the manager ?—No : only he would have to give orders that those instructions should be carried out.

24053. At the present time there is no systematic timbering of the gateways and roadways ?—No.

24054. And, as a consequence, there are continuous falls taking place near the working face ?—Yes.

24055. What is the nature of the roof ?—We have what we call a rock roof, which is a strong roof, and we have a binding roof, which is a tender roof : and the binding roof has a tendency to slip itself up into a narrow gutter.

24056. And there is no timbering done in that part ?—In some cases there is not.

24057. They simply depend upon it getting up into the gutter and stopping there ?—Yes.

24058. The sides simply meeting and binding one another in ?—Yes.

24059. In the meantime most of that debris is thrown to the side ?—Yes.

24060. And that is what blocks up the sides of the road ?—Yes.

24061. I suppose there are many minor accidents which take place that are not reported to the Mines Inspector ?—Yes, many.

24062. What you suggest is that there should be sufficient room in the sides of the roads or travelling, not only in horse roads, but where the men convey their tubs by hand ?—Yes.

24063. Have you known any accidents arising on those roads ?—There is one accident reported, I believe, in 1905 or 1906, illustrative of that, where the man was tramming his tub, and the roadway was so low he could not look up, and he ran into the man in front of him. Supposing there were two or three like that following one another, and the first man's tub gets off the road, or becomes stopped, then I do think the road should be of sufficient width to allow him to get out of the way, and prevent his being crushed.

24064. That is a fairly common cause of accident where tramming is done in that way ?—Yes.

24065. Or even where horse haulage is done, you think the roads should be that width ?—Yes.

24066. I suppose the only place for the pony driver is between the pony and the tram ?—Yes : but although that is the natural place, owing to the state of the roads being rough, with coals falling off the trams, it becomes a very dangerous place for the lad to walk between the shafts or the limmers—as we call them in Derbyshire—and the tub.

24067. And very often he has not room to walk in any other place but in the middle of the roadway ?—Yes.

24068. Now the trailer which you speak of, being attached to the last tub, or train of tubs going up a hill, would not be suitable while that train of tubs was going down the hill ?—No.

24069. Consequently some other appliance would require to be fixed to the tubs in going down a steep incline in order that if a breakage of a coupling or draw-bar took place part of the train might not run away ?—Yes.

24070. Do you know of anything which would tend to prevent that ?—Yes. In our collieries in some cases they put two clips on, one behind the run and the other in front ; but where there is a steep gradient they have lashing chains, which, being of iron, thrown over the top of the trams from the commencement to the end, if there is a break the tub lifts up and gets off the road, and so it prevents any running away.

24071. You would not care whether that lashing chain was under or over the two tubs so long as it attached the whole train together ?—Quite so.

24072. With regard to gates on cages, have you known of men jumping off or jumping into a cage when it is just going away from the bottom ?—I have not known them jump, but I have experience of one case, because I once had the necessity myself of jumping off.

24073. If there were the gates which you speak of, then when the cage was loaded up with men those gates would be shut, and no person could attempt to jump on the cage when going away ?—That is so.

24074. You think it would tend to greater safety ?—Yes.

24075. (*Dr. Haldane.*) If the gate had been there you could not have jumped in the case you refer to ?—No.

24076. Was it necessary for your safety to jump off ?—Yes, at that time it was necessary, and the reason was this : it was a small colliery with only one cage, and I got on at the surface to go down, and instead of the man lowering me down he took me up. At that time and at that colliery there was no detaching hook attached, and no provision made for preventing over-winding, and the result was I jumped off the cage, and the cage went simply over the wheel.

24077. (*Mr. Smillie.*) If the gate had been on there you would have been over the wheel as well ?—Yes.

24078. There is a danger either way ?—Yes, there is a danger either way ; but I believe a gate, considering the speed of raising and lowering at modern collieries, would prevent accidents, although I admit we have not many accidents of that nature to-day.

24079. (*Dr. Haldane.*) You would have also to consider the possibility of the cage going down into the sump, I suppose, at the other end ?—No, it cannot go into the sump, for the simple reason that there are strong baulks put across to prevent it. It lands on the solid bottom.

24080. Or going violently against the baulks ?—Yes.

24081. (*Mr. Smillie.*) Those baulks close when the cage has gone up ?—Yes, there is a provision of that sort made to prevent people at the pit top falling down the shaft when the cage is running. At the present time at the end of the cage when men are being raised or lowered there is simply a bar on each side of the cage, and a chain.

24082. I am now dealing with the method of preventing the cage going down the shaft. You propose having two props close to the bottom of the cage, so that the cage would be set back ?—Yes.

24083. And those would automatically allow the cage to go up, and then close, and prevent the cage going back ?—Yes.

24084. We call them shuts, but you call them props. There would not be much expense in having those fixed at any colliery ?—No : we have them at work to-day at one of the largest collieries in the Derbyshire Miners' Association—that is, the Warsop Main Colliery, of the Staveley Company.

Digitized by Google

24085. (*Mr. Ratcliffe Ellis.*) The accident that happened to you when you had to jump out would not have been prevented by any arrangement that I can see, because it is the case of a man starting the engine the wrong way, and it is not the case of a cage coming up and not stopping in time ?—That is so.

24086. That could be prevented by an automatic arrangement ?—Yes, an automatic arrangement attached to the engine.

24087. It would not have helped you in your case ?—No.

24088. (*Mr. Smillie.*) With regard to fast winding, is it not the case that sometimes in lowering men they may be dropped 30 or 40 feet, almost as if the rope had not hold of them at all ?—Yes, it seems to have that effect when you are starting from the top.

24089. Does it not very seriously affect ultimately the nervous system of the workman ?—Yes.

24090. And the men are strongly opposed to being dealt with in that way ?—Yes.

24091. Have you yourself on some occasions felt almost as if the rope had broken ?—Yes, I have thought we were off to heaven.

24092. Do you really mean by your evidence that in addition to regulating the number of men to be on one deck so that there would be sufficient comfortable space for them, you would also prevent a large number of men being on the cage at the same time ?—Yes, and for this reason ; if we are to look forward to a curtailment of hours, then we may have a great increase in the number of men being lowered, and greater anxiety to get the men down and also getting them out. I do think that a legal limit ought to be made to the number of men to be in any one shaft at once. In our colliery it continually takes place in the morning that when one shaft is being drawn in and the other taken out, there are 36 men in the shaft at once. I do think that is quite plenty in a shaft at any one time.

24093. Are you aware that there may be shafts in which 72 men may be in it at one time descending, and 72 ascending ?—I am not aware of that.

24094. If, at the passing-way, the cages came in contact, a disaster perhaps quite as serious as an explosion might take place ?—Yes

24095. And on those grounds you would prefer to limit the number of men to be in the shaft at one time ?—Yes, or the cage.

24096. The enginedriver being human, some serious accidents might take place which would cause disaster ? —Quite so.

24097. Are you in favour of deputies and firemen holding a certificate of competency ?—Yes, I think they should all pass an examination, and be able to secure a certificate of competency.

24098. So far as the safety of the workmen is concerned, do you think they are the most important men in the colliery ?—Yes, I do, because they are continually coming in contact with the new conditions that open up at the varying workings of the coal face.

24099. Have you any experience of what is called stoop and room work ?—No.

24100. Your experience is longwall ?—Yes, longwall.

24101. Can you tell us the reason why the deputies insist upon taking out all the timber although they know it will be lost, or that some of it will be lost ? Is it in order to get the roof down ?—No. I believe the instruction is received from the manager that all timber must be drawn ; and when they know from their own experience that it is impossible to recover the timber they say it must be taken from under the roof, and therefore placed out of sight of the manager.

24102. You say that process is dangerous ?—Yes.

24103. Is it the person who takes it out who runs the risk, or the person instructing him ?—The person that takes it out is running the risk.

24104. And another man instructs the stallman that he must take out that timber, although he recognises there is considerable danger in taking it out ?—He knows in his own mind it is impossible to recover it.

24105. And there is great danger in taking it out ? —Yes.

24106. Your evidence is that the stallman being an experienced man at the face should have a voice in saying whether certain props should be drawn or not ?—Yes.

24107. What would be the result if the stallman refused to obey orders and refused to take out the props which he believed to be dangerous ?—Well, in most cases he would have to submit to a fine for leaving them up.

24108. And disobeying orders ?—Yes.

24109. (*Chairman.*) What sort of certificate do you suggest the fireman should have ? Do you suggest he should have the present second-class certificate, the same as you have ?—Well, I think it would be a very good thing ; but it is perhaps not necessary to go quite so far as a second-class certificate with a deputy ; still I think it should be such a certificate as would require a real practical man to pass an examination to secure it.

24110. You suggest there should be a special fireman's examination, and not the present second-class certificate examination ?—Yes.

24111. (*Mr. Ratcliffe Ellis.*) You would consider that the man who had the present second-class certificate would be qualified ?—Yes.

24112. (*Mr. Smillie.*) Providing he had the practical experience ?—Well, I presume he would have the practical experience before he secured it.

24113. (*Dr. Haldane.*) Whom do you think should be responsible for seeing that the timbering of the roads is carried out ?—I think that the instructions ought to be given, and the maximum fixed by the inspector, and then the responsibility falls on the management to see that it is carried out.

24114. Can you tell me what exactly are the responsibilities of the deputies with regard to timbering ? Do they see that the face is timbered in accordance with the rules existing in the colliery ?—Yes, that is their duty ; and also if they see that the systematic rule which is laid down does not apply, then to give instructions for timber to be set which will secure the roof.

24115. You think they should be immediately responsible for the timbering of the roads ?—Yes, under the manager.

24116. The deputies are at present responsible for the safety of these roads, are they not ?—Yes.

24117. You think they do not set sufficient timber just now ?—I do.

24118. You think they are two economical with the timber ?—That is it.

24119. Can you tell me whether a deputy is ever paid a lower wage than a hewer at the face, in your district ?—Yes, I have no doubt they are, especially the contractors —the contracting coal-getters.

24120. Do you think the wages of a deputy are sufficient considering the responsibility placed upon him ? I will put it in this way : do you think that the wages of the deputies are sufficient to attract the most capable men to the post ?—I do not.

24121. Do you think it would be conducive to safety if they were paid higher wages than they are at present ?— Yes. I believe it possible in many cases for a man contract coal-getting, or what we call a stallman, to get better wages than the deputy is paid by the day. Of course, if a contractor, he has a certain amount of risk to run whether he gets the money or not.

24122. (*Mr. Enoch Edwards.*) What would the fireman's wages be, do you think ?—I think the head deputy's is 7s. 6d. a shift now.

24123. (*Mr. F. L. Davis.*) Does that mean six shifts a week ?—Yes.

24124. (*Mr. Enoch Edwards.*) That would be something like what a day wage amounts to now ?—It is about the same as our day wage now.

24125. (*Dr. Haldane.*) There is nothing extra ?—No.

24126. There is no inducement to a properly qualified man to apply for the post of fireman ?—That is so. There is just this in it—he has practically a standing wage, but at our hard coal collieries with the times we are having now, that does not make so much difference.

24127. (*Mr. Ratcliffe Ellis.*) At other times it would make a difference ?—Not at our collieries, but at several of the collieries I have no doubt it would.

24128. In Derbyshire in the summer time the housecoal collieries are working sometimes only two or three days a week ?—That is so.

Mr. Walter Marriott.

26 June 1907

24129. (*Mr. Smillie.*) Is the deputy or fireman working most of the time?—In some cases I do not think the deputy goes when the colliery is standing.

24130. (*Dr. Haldane.*) Have you ever considered the question whether it is desirable to provide at the pithead means for washing and changing cloths?—Yes, it is a very necessary thing, and to prove that I believe in that, I for over two years took a dry pair of trousers and singlet and flannel belt to change when I have done, and for over eight years I have taken a dry singlet and belt to put on when I have done my work. I believe those provisions should be made.

24131. Where did you leave those things?—I took them into the stall.

24132. You put the clean ones on when you started to go home?—Yes.

24133. Still, you could not, of course, wash yourself, but you just put them on anyhow?—Yes.

24134. Does it cause much inconvenience at home for a man to come into the house all dirty and covered with coaldust?—Yes, many of our colliers' houses are very small, and it does cause great inconvenience, as there is no provision made for a man to have a complete bath.

24135. It is very inconvenient in every way for them to come home black and dirty, I suppose?—Yes.

24136. Are you acquainted in any way with the provisions which are made in many mines for washing at the surface and the changing of clothes?—No.

24137. You have not considered how it could best be done in England?—Yes, I believe myself that there might be baths and wash-houses provided at the collieries for the men, and also places for their clothes to be dried which there is at the present time in sinking—for instance, where the work is very wet, the company will provide a cabin on the bank and a place for the men to have their clothes dried.

24138. That is a small thing, and will only hold a few men?—Yes, that is so.

24139. Are these men employed in sinking often Cornish men?—No, coal-pit sinkers.

24140. Are you aware in metalliferous mines that it is the general custom to supply what they call a place for washing and drying?—I believe that is so.

24141. I thought these men employed in sinking were accustomed to that sort of thing?—No, the men sinking our coal-pits I am speaking about.

24142. They are not colliers at all; they are specially employed in sinking?—No, not altogether; some of them are, but they follow occupations besides sinking; many of them, when they have sunk a colliery and get to the coal, find that the colliery expect them to receive some of the great benefits from it, and they stop at it.

24143. Do you know in your district any cases where a miner's family is in a one-roomed house?—No.

24144. You have never heard of such a thing in your district?—No.

24145. (*Chairman.*) Is there anything else you would like to say?—No.

Mr. William Sewell, called and examined.

Mr. William Sewell.

24146. (*Chairman.*) I understand that it is the wish of the Derbyshire Miners' Association that you should give evidence before us?—That is so.

24147. You belong to the same Association as the last witness?—That is so.

24148. Where are you employed?—At Holbrook, J. and G. Wells, Ltd., Eckington Collieries.

24149. Have you worked there always?—No: I have been there something like 36 years.

24150. You have been a stallman for 34 years?—Yes.

24151. At the same mine?—Not exactly the same mine, but the same Company.

24152-4. You have always worked under the same Company?—Yes.

24155. What other experience have you, except under that Company, of practical mining?—I have worked at other collieries besides. I did not have such a great deal of practical mining, because I maintain you do not get practical knowledge until 21 years of age.

24156. Since 21 years of age you have worked under this company?—Yes.

24157. You are still working now?—Yes.

24158. At the coal face?—Yes.

24159. We know you are a stallman. How big is your stall? How many men are working in your stall?—We vary at our collieries in stalls. Sometimes we have a longer stall and a larger number of men, and sometimes we have a shorter stall and a smaller number of men.

24160. How many stallmen are engaged in looking after the timbering?—Chiefly three. That is a rule in our particular colliery.

24161. (*Mr. Ratcliffe Ellis.*) In what distance?—The distance of the stalls.

24162. Yes; what is the distance?—They vary: perhaps 40 yards.

24163. There is a stallman in each stall?—Yes. 40 or 50 yards, and sometimes a little less.

24164. One of these men looks after the timbering?—Every man is responsible. Each stallman is supposed to take his share of responsibility and take any corner he is asked to take.

24165. (*Chairman.*) Has your stallman any particular responsibility with regard to drawing or putting up timber?—Every stallman is supposed to either set timber or withdraw it.

24166. Every man working in the mine?—No, every responsible stallman

24167. There are three responsible stallmen in every stall?—Not in every stall: they vary according to distance, and how it is worked, whether night or day.

24168. How many men would be working under the three stallmen at the same stall?—They vary; sometimes more and sometimes less.

24169. Ten or a dozen?—We do not work so much on that long butty system. We work two stallmen or three day-men, or three stallmen and two day-men, just as circumstances permit.

24170. The stallmen are responsible for putting up and drawing the timber so as to prevent accidents?—That is so.

24171-2. I understand that you wish to point out the danger of working more than one seam in a shaft?—Yes. As far as our county is concerned, the men seem to have more fear now of riding up and down than they have of working at the coal face. We must admit when we see the large amount of coal that is drawn now and the small number of accidents, that it is remarkable, when you come to look at it in that light, but we think they might be brought down to a minimum. We think in the near future that we shall have a big disaster; we have such fast running and big loads and more than one seam worked in a shaft.

24173. Take the last first. With regard to more than one seam worked in a shaft, what are the dangers you are afraid of?—I have a plan which I could illustrate to anyone. Why we have objections to more than one seam in one shaft is having men drawn out of various seams at one time.

24174. (*Mr. Enoch Edwards.*) You would not object to 10 seams if all brought to one level?—That is my point. We have had a serious shaft accident in our district—I am bordering on the Derbyshire line—at Orgreave, where we had three men killed and one seriously injured through having more than one seam in one shaft.

24175. (Mr. *Ratcliffe Ellis.*) When?—That was four months ago.

24176. This year?—Yes.

24177. (*Chairman.*) How did the accident occur?—They work the Silkstone and the Parkgate in one shaft. The Silkstone is 90 yards below the Parkgate. It is usual to let men down to stop at either of those places, either ascending or descending. On this particular day there was one man ascending to the Parkgate from the surface, which was 90 yards off the Silkstone bottom. He gets on at the top, two more men get on at the Silkstone at the bottom to ascend. When the engineman receives the signals he goes on to the Parkgate and collects two more men. That means that there are four men hanging in

Digitized by Google

the shaft 90 yards off the bottom, and one hanging 90 yards from the top. He gets his signal to go on again, and the engineman goes on while he gets his descending man to the Parkgate. He leaves that man there, and his four men in the shaft 90 yards off the top. When he receives the signal to go on he goes on, and the consequence is men are into the pulleys in a twinkling of an eye: from loss of memory, through some cause which I am not prepared to explain, in half a second he knocks their skulls in and permanently injures others. We say if there had been one shaft in one seam he would have started from the bottom and gone to the top with his load in a successful manner. That is one reason why we object to more than one seam to one shaft. We think it could be worked by bringing it to one particular level. In our collieries we have three seams in one shaft. There is such a complication of signals it is an easy thing for an engineman to forget. You are forced to have one on-setter to look after these three shafts They do not draw coal out of these three seams in this shaft, but they take the men up and down.

24178. (*Mr. Enoch Edwards.*) Where do they get the coal?—The coal is drawn out of either shaft. They have a drawing shaft for the Parkgate, and they draw Flockton and Silkstone from this particular shaft where they raise and lower the men. They have two shafts: one is down to the Parkgate only, the other down to the Silkstone 90 yards below the Parkgate, and then there is the Flockton three seams in one shaft to draw men out. The Parkgate coal goes to that particular shaft where the bottom is permanent, but the men have to be drawn out of the Silkstone shaft; that means three lots of men drawn out.

24179. (*Mr. Ratcliffe Ellis.*) Which is the bottom of all, the Parkgate or the Silkstone?—The Silkstone, above the Parkgate.

24180. What depth is that from the surface?—I think about 290 yards.

24181. Next to it coming up is the Parkgate?—Yes.

24182. What is the distance?—90 yards between the two.

24183. Is there another seam?—Yes: I believe that is 120 yards from the surface.

24184. What is the name of that?—The Flockton.

24185. In this pit they do not wind any coal at all?—Yes, out of Silkstone and Flockton.

24186. They wind coal from these mouthings?—Yes, but there is a permanent bottom to the Silkstone.

24187. Where do they wind Parkgate?—Another drawing shaft some distance away.

24188. The Silkstone and other seams are wound where you are speaking about?—Yes.

24189. Your objection is to winding men from two or three mouths?—Yes.

24190. (*Mr. F. L. Davis.*) It is rather confusing: it is not the number of seams worked, but the number of levels worked you object to?—The number of mouthings.

24191. For handling men?—Yes.

24192. (*Mr. Ratcliffe Ellis.*) How would you alter it in that particular pit? Where would you wind the men?—I should have them brought to the one level.

24193. How?—By drifting down to it.

24194. It is 90 yards?—It is done at some places. It is not a question of cost: it could be done. It is not a question of cost with me: it is a question of safety.

24195. You can drive a down brow?—I should have drift to down to one, and up to the other.

24196. That is an incline. Instead of a perpendicular shaft you would have to have an incline?—Yes.

24197. What would the inclination be?—I have not worked that out. It is not my practical experience to work that out.

24198. That is the alternative?—Yes. The gradient can be got. It is very steep. They are drifting down to one particular seam now which is very steep.

24199. Would there not be very much danger in a steep gradient?—No: the further the distance the gradient would not be so steep.

24200. You have no idea of cost?—No. Cost has nothing to do with me: it is a question of safety.

24201. Not even if it was so much that you would have to stop working these mines altogether?—I do not think the employers from their side study the cost. They are willing to co-operate with the miners' leaders for safety at the present time. That is my opinion. I know a colliery in Derbyshire which works upon that principle. I have been there to make an examination, and they have drifted down. They take a longish distance and the gradient is not so steep.

24202. The object is to prevent an accident such as you have described?—Yes.

24203. That arose from a momentary loss of memory?—Of the engine man. Had he not had those two shafts to collect from and to collect and deliver men, he would not have made the mistake.

24204. If it was a loss of memory the mischief might happen whatever you have?—Yes, but I am not going to say that he would have lost his memory if he started from the bottom. It looks very dangerous when he has to start 90 yards from the bottom and stop three times on the journey. We say that it is a dangerous experiment.

24205. (*Mr. F. L. Davis.*) Is that the only case of an accident in that mine?—It is all I know of of that particular character. There was also the Shirebrook disaster which caused men in our county to feel very much about riding up and down the shafts.

24206. (*Mr. Smillie.*) An engine winder will have three different bells?—Yes, three different signals. If he had to go from the bottom to the top he would ring seven to the engineman to ascend to a certain seam of coal: then he would have to give three other signals that a man is ascending. Then he would have to ring off: then he gets to his particular coal mouth, and he has to give other signals for the work to be performed, either running on coal or sending men out.

24207. (*Mr. Enoch Edwards.*) Have you had any experience of men falling down from those insets?—We have had no one fall down, but there comes another danger which I shall be able to explain.

24208. (*Chairman.*) That is all you want to say about the seam. Then you say it is dangerous to allow men to get on the swinging cages?—That is to say, at these mouthings. You are compelled to have your cage a certain distance off the side, and when men have to get on that cage you are entirely in the engineman's hands. He has to hold you by his brake, or some other process. We say, when we get on that cage and the steam brake, or whatever he holds us with, goes wrong, it would dash us down into the bottom. We cannot have props in, because it would be such a danger to have props for the cage to drop on. If the props were left in and the cage caught them, you know what the result would be, if there were men on the cage.

24209. (*Mr. Wm. Abraham.*) What is there to help the man stepping from the mouth on to the cage?—At this particular shaft, about 15 inches from the mouth to the cage, there is a kind of board about 8 inches broad, dropped down for them to step on to. It is held by a chain. The Company do all they can to prevent anyone falling down. I have no charge to make against them whatever.

24210. It is not a question of charging. We want to know the system?—The system is dropping a board down about 8 inches.

24211. (*Mr. Ratcliffe Ellis.*) There is a guide on the shaft?—Yes, the conductors, but that does not stop the swinging cage.

24212. The guides are swinging, too?—I am not prepared to say they are not.

24213. If they are not swinging, the cage is not?—They are supposed to be tight. If they get a little slack they might swing. I know a case a little while ago where the rods got slack, and by the men getting off at that particular station it twisted the cage, and when the engineman had to start his engine his chains and the rope dropped on top of his cage. He shoves his steam brake on to catch the cage, but as soon as he does that the cage drops. Had there been men on it it would have broken their legs or thrown them off, unless there was something across to stop them.

24214. (*Mr. F. L. Davis.*) With all this danger, I think you said just now that there has never been a case of a man falling down?—I have never known one.

(*Mr. Enoch Edwards.*) They have fallen nevertheless, to my knowledge.

(*Mr. F. L. Davis.*) In that particular pit?

(*Mr. Enoch Edwards.*) In the system.

(*Chairman.*) How do you propose to remedy that?

24215. (*Mr. Ratcliffe Ellis.*) Bring them on to one level?—Yes: one level is the remedy. I may illustrate this as it is in a colliery I know. There may be a lot more in operation. I know a good many working on the system I have suggested. I am making no charge of any neglect against any particular man.

Digitized by Google

Mr. William Sewell.

26 June 1907

24216. (*Mr. Wm. Abraham.*) How is the coal put on the cage?—On this cage here there is a door they drop down, which drops it on to the cage and runs the trams on, and it is worked by a weight and pulley, and when he has done sending coal out of that particular shaft he pulls his door up, and has a clear run for the cage.

24217. The cage is hanging in the shaft all that time?—All the time they are running coal on.

24218. (*Mr. Ratcliffe Ellis.*) Your danger is stepping on and off the cage at the mouthings?—Not altogether: it is the swinging of the cage.

24219. You do not mean when the cage is swinging at the mouth: it is the danger of getting in when it is not steady?—I do not mean that the only danger is getting on, but you are swinging, and there is nothing to prevent you falling if the engineman lowers the cage

24220. It is getting on and off the cage at these points where the danger is?—Yes.

24221. When once in the cage you are all right?—Yes, without the engineman lets you go before he gets his signal, or unless his steam brake was to let you go.

24222. A man winding the wrong way at the top?—He has to hold us by a brake, and if his brake did not work we should have to go against his will or his wish.

24223. (*Chairman.*) You want to tell us something about the danger of lowering a large number of men down the pit at the time?—We think the time has come when there should be some limit put on large numbers of men riding up and down the shaft at the time.

24224. That not more than a certain number of men ought to ride up and down the shaft?—We think that it should be a question for the inspector, and that he should have some power over that. Now the manager puts a board up, and says 20 men must ascend and descend this shaft at once, and we are compelled to comply with his orders. I can remember, in my own experience, when we did not have more than four, but I do not want to go back to that time. We think some limit should be put on what numbers should ascend and descend a shaft at one time. We are afraid in the near future that we shall have such a disaster that it will be as bad as a ship going down.

24225. Do you mean that the cages ought not to accommodate more than a certain number of people?—We believe that more than a certain number of people should not be allowed to ascend and descend at one time.

24226. In a cage?—Yes.

24227. Do you mean that they ought to be built not to accommodate more than 10 or 12 people?—I do not care how large you build them as long as you restrict the number.

24228. As long as you restrict more than a certain number of men coming up or going down at one time?—Yes.

24229. Why do you consider that would conduce to safety? What is the objection to having a cage holding 16 men?—Because we think there will be a great loss of life.

24230. If there was an accident, 16 men would be killed?—Yes. We think it would be sufficient if you had a certain number fixed. I am not going to place the number. It is a serious thing to have 40 men on the cage and all be dashed down at once. It is, of course, a serious thing if you only have one

24231. Do you think that 16 or 18 should be about the largest capacity of one cage?—I believe there are some many more than that. They load more than one deck.

24232. They have two decks?—Two or three decks.

24233. So that there are as many as 40 or 50 in the same cage?—In our particular colliery we lower 18 down at the time. There are collieries not far off where they let 24 down at a time, and I have heard it said that there are places where there are 40 who go up and down at a time, but whether that is so I do not know.

24234. There may be as many as 40?—Yes, and we think that it is getting too large a number when we see the deep mines and the fast running which we have.

24235. Would you prevent more than a certain number being carried up at one time, or only have so many men to work in the seam served by the same shaft?—We do not wish to interfere with the seams at all: it is the riding up and down.

24236. The men working the seams must be brought up and down somehow. Do you suggest that here should be a limitation of the numbers of men who could work in a seam served by the same shaft?—We do not wish to put a limitation on the working: we wish to put a limitation on the number going up and down.

24237. When you are working you must ascend and descend. I want to know what you mean?—It would only add a little on the time.

24238. (*Mr. Ratcliffe Ellis.*) You want to limit the hours the men may be down and at the same time let them take longer to go down?—No, I am not discussing that.

24239. I thought the two had some relation?—I am not dealing with that.

(*Chairman.*) I do not understand what you mean.

(*Mr. Ratcliffe Ellis.*) You must take a longer time to bring the men up and down that you do now?

24240. (*Chairman.*) You would not interfere with the number of men that might be working all together in the same seam?—No.

24241. But you would say that not more than 10 or 12, or some specified number, should be taken up at one time?—Yes.

24242. Directly you have taken up one lot you would take up another lot, all through the day?—Yes.

24243. (*Mr. Smillie.*) In a colliery employing 500 men, if you limited the number to eight on the cage, would it make more than 15 minutes' difference in getting them down?—I do not think it would take much longer to get them down.

(*Mr. Ratcliffe Ellis.*) The Departmental Committee said it took an average of an hour taking the men up and down. It would take two hours probably if your suggestion were adopted.

(*Mr. Smillie.*) Two minutes will run from the surface to the bottom in any pit I know. If, instead of running 20 men on the cage, you limit the number to 10, it will double the time it will take practically to put down 500 men.

(*Mr. Ratcliffe Ellis.*) If it takes one hour, on an average, for both journeys, it would double it.

(*Mr. Smillie.*) If an accident does take place, those men want to limit that accident to eight or ten.

(*The Witness.*) We do not say at the present time that it shall be eight or ten. It might be 20, but we do not want to go further. We are rather afraid that we might increase to 40 or 50.

24244. (*Mr. Ratcliffe Ellis.*) The statistics show that travelling up and down a shaft is about the safest part of working in mines?—Yes.

24245. Do you agree with that?—Yes.

24246. You say you want to provide in case there should be an accident in the shaft, that there shall be as few men as possible in it?—Yes.

24247. Why not also provide that in the most dangerous part of mining, namely, in the seam itself, that there should be a limit to the number employed for the same reason? Our accidents are to a good many individuals. We do not get many explosions. That would be only in the case of an explosion.

24248. Are there not far more accidents from explosions than even in the pits?—I do not think there are.

24249. You must look at the statistics. What reason is there for reducing the number of people in a shaft in order to prevent excessive loss of life or injury in the case of a winding accident, which is very seldom indeed, if you do not at the same time propose to reduce the number of people employed in the mine where an accident is more likely to arise, in order to secure the same result?—We are rather afraid we are increasing in speed when lowering men up and down.

24250. You do not answer my question?—I am not prepared to say that we will restrict the number of men working in the mine.

24251. Why not, except one is a good deal safer than another. You propose to restrict the number of men at the safest part and leave it unlimited at the part which is dangerous?—My point is this: I would rather have to look after myself when I am at work and have a chance of taking care of myself, but I have not that chance when I am in the shaft. I would rather work at the coal face than ride up and down the shaft.

24252. The effect of this would be, if there is a limit to the hours during which men may be down, and it takes twice the time to get in and out, it would reduce the time available for coal getting. Would that not be the result?—It would take longer time.

Digitized by Google

24253. Whatever time you did take off would still lessen the time to get coal, and lessen the output of coal ?—It is not a question of the output of coal, it is a question of safety.

24254. You think it is only necessary to limit the number in the shaft ?—Yes, I do not say whether it should be 8, 10 or 20. I think that should be left to someone else to say.

24255. Do you say that the inspector should prescribe the number ?—To a large extent. I think he should be a high authority in that particular case.

24256. Should he have the last word or not ?—I do not know. I think there ought to be a board.

24257. What sort of a board ?—County board, or someone to consult.

24258. Who is to be on the board ?—I do not know whether I should not have the miners' leaders on, and have a county board.

24259. For what purpose ?—To let them have a bit of practical experience along with the inspectors' experience.

24260. Supposing they do not agree, what is to happen ? —I think they would agree.

24261. Yes, but supposing they did not ?—They would have to have someone to appeal to.

24262. Whom do you suppose ?—I am not prepared to suggest whom they should appeal to; they would have to appeal to Cæsar, or someone.

24263. Who is to be Cæsar ?—I am hardly prepared to suggest, but there is a way out of that difficulty.

24264. Is this to apply only to the number of people to be wound up and down the shaft at the time, or to the general management of the colliery ?—I should have it apply to the number going up and down the shaft.

24265. Solely to that ?—Yes.

24266. Do you know at the present time if the inspector is of opinion that there is any dangerous practice upon the mine he can require the coal-owner to go to arbitration as to whether it shall be continued or not ?—The inspector has not power to say now how many men should ride up and down.

24267. He has not the power, but he has a right, if he considers there is a dangerous practice, to require the coal-owner to arbitrate ?—Yes

24268. What more do you want than that ?—We want the numbers fixed. We are rather afraid that we are going to get to bigger numbers.

24269. It is Section 42 of the Act. At the present time if the inspector is of opinion that there is any dangerous practice—if he thought they were winding too many men in the shaft—he could require it to be altered. If the coal-owner did not agree, then he could go to arbitration, and the higher authority (Cæsar, you call him) would decide whether there should be that number in the shaft or less. Do you want to alter that ?—There is nothing besides the inspector at the present time.

24270. Do you want anything more than that ?—We want the numbers limited. When we have a case in dispute——

24271. We have got to this point: you say whether it is discussed by the men or the inspectors or the employers, that there must be a Cæsar to decide at the end. At the present time you can have Cæsar to decide, because the inspector can give notice under the Act of Parliament, and if the coal-owner will not comply with his requirements he can go to arbitration and the arbitrator will decide what it is to be. He will be your Cæsar ?—But this is my point: we have been lowering 20 men down our colliery and the manager wants to get 10 more down to make 30 at a time, but we think, from the men's side, that it is too many, and that it is too dangerous. We are not experts, but we say we do not think that ought to be done; but whom are we to appeal to at the present time—only the inspector.

24272. Yes, but the inspector, if he agrees with you—you may not always be right—can give the coal-owner notice at present under Section 42 of the Coal Mines Regulation Act where there is any dangerous practice.

(*Mr. Smillie.*) No; that is not a dangerous practice.

(*Mr. F. L. Davis.*) The Witness says it is.

(*Witness.*) It is not according to your own showing. It is according to my showing, but it is not according to your showing.

24273. (*Mr. Ratcliffe Ellis.*) You say it is ?—And you say it is not.

24274. If the inspector considers it a dangerous practice it is his duty to give notice to the coal-owner and require him to stop it.

(*Mr. Smillie.*) To stop winding ?

24275. (*Mr. Ratcliffe Ellis.*) To stop winding the number they say is dangerous, and if not, the inspector can go to arbitration, and whatever the arbitrator decides is the law. What more do you want than that ?—We want power to appeal.

24276. Do you want the power to say what it is to be ?—No.

24277. Why are you not satisfied with the present arrangement ?—We do not wish to have the power to take the sole control out of the managers' hands.

24278. Why are you not satisfied with the present arrangement which enables the inspector—— ?—We are afraid the numbers are going to increase.

24279. You do not answer my question: why are you not satisfied with the present arrangement which enables the inspector to do exactly what you want to do ?—No, he perhaps will not do what we want him to do.

24280. He is entitled to do it ?—We think if the numbers were fixed——

24281. Very well, I cannot get any further than that. However, that is your view. Do you use lamps in your colliery ?—Yes; but before you leave that particular question I would like to have another word on the cage business. There is another dangerous practice about winding men up and down the shafts. Where you have two or three decks, we think the men ought to be loaded at one time. At the present moment at some collieries they do that. You have a false bottom. You are loading coal at some place on three decks or two. You are loading men on both at once. At some collieries you do not. You load the top deck if men are ascending the colliery. The engine-man has to raise you up, and then you are loading your bottom deck; the same coming out, descending. We think the men ought to be all loaded at one time. This is not an expensive piece of business. We think the men ought to be able to get on three decks at one time, and go on the journey without signalling for raising or lowering. We think it ought not to be allowed.

24282. Is that all you wish to say on the shaft ? Inasmuch as there are cases where they put all the tubs in at one time, there might be arrangements made so that they put the men in ?—Yes, where they do not put all the tubs on at one time. We say it ought to be arranged that the men could be all put on at one time, even if they cannot put the coal on.

24283. It would save time ?—Yes. That would be another way of helping. One question will help the other a little.

24284. Is there anything else you wish to say ?—I do not know whether my colleague has explained this, but we think there ought to be some catches when there is an overwinding case. That is in operation at some collieries. I have been there when we have had men's legs broken when there has been overwinding. In these particular cages the springs have acted each time, and if it is not on the cage it breaks the men's legs.

24285. Have you had experience with Bertram's patents? —No; I am speaking of practical experience.

24286. There is a contrivance which stops the engines if the speed is not increased at a certain point in the pit ?—I am speaking of overwinding.

24287. I am talking of preventing overwinding ?—Anything that will prevent it, I agree with. Where it is brought up it is a danger.

24288. It is in existence ?—We say if the springs fail to act in an overwinding case, the cage would have to drop to the pit top on the props. We think it would be a benefit if there could be some springs which would not be interfered with going up and only acting when coming down. It would only act in overwinding. That is in operation at some large collieries. These things can be brought about, and it will be a great saving. It is not only the men killed, it is the men lamed.

24289. (*Mr. Enoch Edwards.*) They have these arrangements at many collieries, and you would make them compulsory ?—Yes.

24290. (*Mr. Ratcliffe Ellis.*) I do not know whether he would say that; this may not be the best thing. I agree that anything to prevent the effects of overwinding should be used, but whether that is the best way is the question ?—Yes.

Digitized by Google

Mr. William Sewell.

26 June 1907

(*Mr. Enoch Edwards.*) The Witness says that the best should be adopted.

24291. (*Chairman.*) Have you anything more you wish to say?—I have nothing more on the shaft accidents without someone has some questions to ask me which I will answer so far as I can.

24292. Is that all that you want to say about accidents in general?—No; only I shall be prepared to answer any practical question so far as I can.

24293. (*Mr. Wm. Abraham.*) With regard to your suggestion to minimise the dangers at the various staging of the shaft, you say that there should be an air drift driven from one seam to another?—That is so—a drift.

24294. I think you agree now with Mr. Ellis, that would be an expense?—Yes.

24295. A great deal of that expense would be saved, in your opinion, by the time that is now lost in waiting and winding from the various mouths of the shaft?—That is so.

24296. (*Mr. Ratcliffe Ellis.*) Would the men have to go down to the bottom or come up to the top mouthing?—Come up to the top mouthing—have a permanent landing.

24297. Would you get them down to the bottom of the pit. There is no permanent landing except at the bottom?—The cost would not be as great as you anticipate.

24298. Say there is the bottom of the shaft and two mouthings. You do not want to wind men from these mouthings at all?—No.

24299. You want to wind from the bottom?—Yes.

24300. You would land them all at the bottom to begin with?—No. If I was going to sink a shaft to three seams of coal——

24301. I am talking of the shafts there now?—I should not bring him to the bottom, I should bring him to the permanent landing.

24302. Where is it except at the bottom?—The stage has been made.

24303. Opposite the mouthing?—Yes.

24304. Why cannot you always do that?—You can make it permanent there.

24305. Why cannot you always do that?—I am not prepared to answer that.

24306. Is it the top mouthing where you make the permanent stage?—No, near the middle mouthing.

24307. You land the men there who are to work at the seams above and below?—Yes.

24308. They would have to travel up?—Yes, up and down the incline.

24309. The longer the incline the less the gradient, and the shorter the incline the more acute the gradient?—Yes.

24310. They would have to travel to get to the bottom?—No, they would be landed in the middle when they get off the shaft, but when out he would have to walk to his coal face just the same.

24311. Have you calculated what length of time the travelling would occupy?—No; it would not take a great deal of time.

24312. It would depend on the length. It would take more time to get to his work?—It would take very little more time.

24313. You cannot form an opinion of the length of time unless you have a plan before you?—If he was landed at the bottom, he would have to walk to his coal face just the same. It would make very little difference in the walking distance. You could not put a permanent landing across. I mean, I should put the permanent landing here which would be permanent and not be removed if I had a pit sunk. If I was going to sink a new pit I should go to my middle coal and drive out my coal. That is the point I should get at.

24314. (*Mr. Wm. Abraham.*) We have got so far, that the extra cost would be greatly minimised by the time saved in winding. That is your opinion when you get to the method of doing this?—Yes.

24315. You would have it done in order to minimise the danger to life and limb arising now from this present system of winding?—That is the object I have in view.

24316. Your idea is that the safety catches which have proved so useful in some collieries should be made compulsory at all?—Yes, as regards overwinding.

24317. Do you understand that the chief purpose of safety catches is to prevent overwinding?—It is to prevent the mischief after the overwinding. It would not prevent the overwinding, but it would prevent the cage dropping any distance after the overwinding.

24318. There is something in your evidence with regard to stalls which I do not quite understand. You call a place in longwall working a stall?—Yes.

24319. You may have 10 or 12 men working in that face?—Yes.

24320. I think you said you may have three what you call stall-men. You call those men practical hewers, practical men who have the responsibility of seeing that that place is worked safely?—I call the men stall-men who sign on a colliery, and he is the man they set it for, a stall-man, a tram-man or a day man. A man signs the book as a competent stall-man, and the management send that man where they like.

24321. The other name of that man would be a practical hewer?—Yes.

24322. They would have a kind of labourer or helper working with them?—Yes.

24323. Each of these hewers are capable timberers?—Yes, they are supposed to be when they are signed on. They sign them on as hewers or stall-men. They are signed on as stall-men and they take the responsibility the same as any other stall-man.

24324. Are they responsible for the timbering of that stall?—That is so.

24325. Are they responsible for drawing out the timber?—That is so.

24326. Is there anybody supervising?—Only the deputy as he comes through. If he thinks the timber is not satisfactory he will tell the man to set more, or if they have a system, and the man is not carrying out that system, he will report him.

24327. What do the deputies do generally?—They have various districts in various collieries. In some collieries the deputy will have a bigger district than others. In some large collieries he will have a big district to examine once during his shift. He may have another responsible man under him who will go round the next time and fire shots.

(*Chairman*) We are going to have two deputies here after lunch who will explain the system.

(*Mr. Wm. Abraham.*) Very well.

24328. (*Mr. Smillie.*) That is a different county?—Different counties have different systems.

(*Mr. Wm. Abraham.*) Are there any men coming to give us a general description?

24329. (*Chairman.*) They are coming from Northumberland and Durham?—The general working of the district is the longwall system.

(*Mr. Wm. Abraham.*) We are very interested in the question of timbering. We consider the question of timbering to be one of the most important questions, and I should like to know what is the general system of timbering, and who does it, and who is responsible for doing it.

24330. (*Mr. Enoch Edwards.*) The last witness covered all this?—A stall-man is responsible for setting all the timber and withdrawing it. He is responsible for his working face from the lip of his gate end right to the end of his stall.

24331. The deputy supervises whether he does his work properly or not?—That is exactly it.

24332. The deputy also examines the places for gas?—Yes.

24333. Or any other dangers?—Yes.

24334. Within your knowledge, are they able to do that to the satisfaction of the body of men?—I should say they are as a rule. I have had no complaints to make with regard to that.

24335. Have you had any complaint as to the size of the district they have to supervise?—No.

24336. Have you any complaints as to the hours they are working?—No.

24337. (*Mr. F. L. Davis.*) Is the pit which you are working in, which you have been describing with the different mouthings, typical of most of the mines in your district?—No there is a lot of them. There is one com-

Digitized by Google

pany, I believe it is the Grasmore Company, which has some on exactly the same footing. There are some others of that character, but it is not the general average.

24338. Yet it is more exceptional than general to wind from two or three different levels ?—Yes, it is not the general thing.

24339. (*Mr. Enoch Edwards.*) Both you and your colleague have called attention to shaft accidents. You have had a rather serious one lately ?—Yes, we have had two rather serious accidents lately, one at Shirebrook and the other at Orgreave, which is close to where I come from —close to Sheffield—and lives were lost in both cases.

24340. I understood you to say you had not known any accidents by the men getting on the cage ?—No, not falling down the pit. I have only known the Orgreave accident where this two-mouth business is on, where an accident occurred as I have described.

24341. You have no cases 90 yards from the bottom where they make a permanent stop and work with a greater or lesser stop ?—There are some of that sort in Derbyshire.

24342. You get a permanent stop ?—Yes, and so regulated that it will stop at that place.

24343. There is no difficulty from a man's brake going off ?—No.

24344. He could not go over it ?—No, I do not recommend that, although it is safer than the other.

24345. There is more permanency about it ?—Yes.

24346. You are more permanently fixed and fenced round to obviate accidents ?—Yes.

24347. When you suggest that there should be a less number of men in the cage, have you fully considered what it means ?—It will mean longer going up and down.

24348. Your colleague's strong point was that they should go at a less speed ?—That is so.

24349. You refer to the fact that the mines are getting deeper ?—Yes, and the fast running.

24350. If you get deeper mines you want less speed and less people in ?—We shall be longer going down, but it is a question of safety with us.

24351. It is a question that has to be faced after all ?—Quite right ; it will take a longer time to do it ; there is no doubt about that.

24352. I understood you to say that there are places where there are 40 men ?—I understand that is so at Hickleton Main.

24353. There are some places where they work double shifts ?—Yes.

24354. Your people fear if an accident did happen —— ? —That it would be as bad as a ship going down.

24355. It would be a very serious accident ?—Yes.

24356. Mr. Ellis said to you why not limit the number of men in a pit if you do so in a shaft. That was hardly what you meant. If a rope broke there is no chance for a man in a shaft ?—No.

24357. If there is a cage coming up it is the same there ? —Yes.

24358. (*Dr. Haldane.*) With regard to your opinion that the number of men in the cage should be limited, I should like to understand your point of view. If a man has to go down a mine every day there is a certain risk, and it will be the same risk whether he goes in a cage with a great many people beside him or only with a few men ? —No.

24359. Each person will undergo the same risk ?—No, he has the risk, but still he has not such a large number.

24360. If there is an accident more men will be killed ? —That is so.

24361. If there are many in the shaft ?—Yes.

24362. There will be fewer accidents because the cage has to go down fewer times ?—That is so, but the engineman will not lose his control so much with a smaller load as he will with a big load. When he gets near the bottom with high speed engines and big loads on he has to use more care, and if he exhibits the least loss of memory you are into the bottom.

24363. I cannot understand that. It seems to me that will be as apt to happen with a small load as a big load ? —His load will not be so heavy against him.

24364. It makes very little difference to the weight of material in the cage. I should think he would have been less apt to make a mistake, because he is always accustomed to winding heavy cages of coal ?—I do not think so ; we who ride up and down every day know what we have to go through. We know when the big loads are on and the little ones. We know when the cage begins to be jerked from practical experience.

24365. That is a different question ; it may be desirable to limit the speed at which men are wound, but I do not see your point exactly in limiting the number of men in the cage. You would not propose to limit the number of men in a ship because of the danger of shipwreck ; you have referred to that ?—We suggest limiting the number.

24366. Would you put a limit to the size of liners going across the Atlantic ?—I am not dealing with liners on the Altantic : I am dealing with men in the cage.

24367. If a liner goes down there would be a fearful loss of life ?—Yes, and there will be a fearful loss of life here if a cage goes down with 40 men.

24368. In the case of a liner we all know it is safer to go in big ships. On the whole there will be fewer lives lost in the big ship ?—There is a difference between being on the ocean in a big ship and in a small boat. There is a great deal of difference between a cage going down a shaft and a liner going down at sea. There is the sea to knock about, but there is not in this particular instance.

24369. I am bound to say from my own experience of small cages and shafts, and so on, that I have always felt the risk was very much greater than in large ones ?—You have not had quite as much experience as I have riding up and down.

24370. I believe I have ridden in a greater variety ?—You may have, but yours were only casual visits.

24371. But I have made casual visits to a great many curious small shafts particularly ?—They will bestow a good deal of attention upon you perhaps.

24372. I am making no objection to your limiting the speed, but I do not see your point in limiting the number of men in the shaft. It seems to me it may be safer on the whole to wind carefully with a large number of men in the shaft than to wind fast, at the ordinary speed, with a small number on each journey ?—I am afraid you are looking at cost a little bit, and at the time it would take to lower the men down.

24373. That is the difficulty of your position, I think ? —I will take it you are all anxious to minimise accidents.

24374. Yes. Do you not think that a manager will take much greater care if he know that if there is an accident there will be perhaps 20 or 30 men killed ?—I am not prepared to say a disrespectful word against a manager. I believe a manager will exercise all that lies in his power.

24375. Do you not think that he will take extra care if he knows that an accident would be a very serious thing ? —I take it that managers are the same as miners, they are tempted to go over the mark : I am afraid they are.

24376. Taking it on an average, do you not think they would be more careful with large numbers of men in the shaft at a time ? Have you ever considered the desirability of providing arrangements for washing at the pit head ? —No.

24377. And changing clothes ?—No.

24378. You have not considered that yourself ?—No. Do you mean the German system ?

24379. Yes ?—No, we have not.

24380. Have you anything to say about the question of sanitation in mines ? Have you anything to say with regard to the provision of sanitary conveniences ? Do you think that there is any necessity for it ?—I do not think there is in our mines. Ours are well ventilated. There may be in some fiery mines. I have not considered it. There may be need to consider it in some deep, hot, fiery mines, but I think in our mines there is no necessity.

24381. There is no mess or nuisance down the pit ?—None whatever.

24382. Can the men use the goaf ?—Yes.

24383. So that in that way there is no trouble in your district ?—There is no trouble. Our seam unfortunately possesses a great deal of dirt.

24384. There is plenty of dust to bury it in ?—That nuisance, if there is any, occurs chiefly on the haulage roads with the boys. I do not think that there is anything of that sort in our mines.

Digitized by Google

Mr. William Sewell.

26 June 1907

24385. (*Mr. Smillie.*) Supposing it was the custom in a colliery to allow 20 men to ride on a cage at the same time, and by law it was limited to 10—you have not suggested any number, but that is what you mean to prevent it going beyond a certain number ?—Yes.

24386. In that case, instead of having to run 20 cages you would have to run 40 ?—That is so.

24387. So that you would have 40 risks instead of 20 ?—That is so.

24388. Dr. Haldane's point is that the risk ultimately would be the same ?—Yes, only it would not be so great if one went wrong.

24389. You would have two risks against one ?—Yes.

24390. Is it the custom in your county supposing a father and four sons were in the pit bottom at the same time to allow those five to travel in the same cage ?—Yes, there is nothing to stop them. I have five sons working in the mine, and two come up with me every day. I have seen five of us on the cage at once.

24391. If anything went wrong the whole family is wiped out. It would be a very nice custom if you did something to prevent that taking place. Do you know any case in Derbyshire where the fireman has anything at all to do with the regulation of the output, or has to see to the output going out, or exercise any supervision over the output ?—Yes, it depends a little upon what district he has. If he has a small district—he has in our colliery—he has to look after the output. There are what we call "corporals," or "doggies," they are sometimes termed, who are responsible for getting the stuff out. He is solely responsible for the safety of the road but he has a certain amount of responsibility on him for getting the coal out of that particular district.

24392. If the district is small, in addition to looking after ventilation and timbering, he has to look after the output ?—He has to look after getting the coal out.

Mr. JAMES CLARK, called and examined.

Mr. James Clark.

24393. (*Chairman.*) Do you represent the Durham Deputies Mutual Aid Association ?—Yes.

24394. Have you been a deputy yourself ?—I have been a deputy about 25 years or over.

24395. Are you still working as a deputy ?—Yes.

24396. What does your Association represent ? Does that represent practically all the deputies in the county of Durham ?—About two-thirds of them.

24397. Is the other one-third outside your Association, or have they an Association of their own ?—Some are in the Miners' Association, and some are outside altogether.

24398. You, however, represent the majority of deputies in the county of Durham ?—Yes.

24399. You speak not only for yourself, but for the Association ?—I speak for the county.

24400. You say that no deputy should be allowed to fire shots whilst having to follow his ordinary duties at the face. Some deputies that have small districts and can get through their districts without taking up the whole of their time, are sometimes occupied on other work from time to time, and it is that you object to, or is it only to shot firing ?—We object to any shots fired during the day by deputies. Where a deputy is not fully employed in looking after his men at the face there is another kind of work assigned to him, ordinary shift work, or any special timbering. He has this to fill up his time, and where a deputy is fully employed he cannot, with that safety necessary to himself and the men he has to fire shots for, attend to this duty too.

24401. You do not object to a deputy doing various duties in connection with the mine that do not affect the safety of the miner. His first duty is to do everything necessary to ensure the safety of the mine ?—Yes.

24402. In addition to that, where he has a small district it is usual to take a part, on behalf of the management, in the working of the mine, that is, to look after the trams, and so on ?—Yes.

24403. Do you object to that system ?—We do not object to anything except the shot firing.

24404. Do you object to his being obliged to look after shot firing ?—Nothing apart from the shot firing. We simply object to the shot firing.

24405. Why should you object to the shot firing more than other kinds of duties that take up his time ?—Because we regard shot firing as being a more dangerous work than the ordinary timbering or making places ready in connection with the working of the districts, and a very slight mishap on the part of the deputy might lose his life and those he is firing shots for.

24406. You consider that the deputy as shot-firer should on all occasions be different people, or that the deputy should have certain times assigned to him for looking after shot firing, and that he should have nothing else to do during those hours ?—We think that there ought to be a special class of men appointed as shot-firers.

24407-8. Quite distinct from deputies ?—Yes, apart altogether from deputies.

24409. Then you say when a deputy has made complaints respecting over-work through having too large an area and number of men, and gets no redress from the management, that he should have power to appeal to the Inspector of Mines for the district, whose decision shall be binding. You propose that the inspector, if appealed to by a deputy on the ground that the district is too large and that the deputy cannot do all that he ought to do, should have power to call in the Inspector of Mines, whose decision shall be final ?—When other means have failed. First of all he must seek redress from the management, and if he and the management cannot agree as to what is reasonable for the deputy to do, then as a final resort he should call in the Inspector of Mines to say whether the deputy has too much work or not. There is a general complaint throughout the county now in consequence of the large area the deputy has to travel. The districts are so wide, and the number of men to follow so many, that it is practically impossible to follow the men to do justice to them and with safety to themselves.

24410. Can you not put those instructions before the Inspector of Mines now and get him to suggest to the management when he considers these districts are too large ?—The law does not give us any power to do so.

24411. You can make any representation to the Inspector of Mines you like if it concerns the safety of the working of the mine. It would be open to you to make any complaint to the Inspector of Mines, and he might make any representation he thought fit to the management: whether the management would be bound by it or not is another matter. Section 42 of the Coal Mines Regulation Act says: "If in any respect . . . any inspector finds any mine, or any part thereof, or any matter, thing or practice in or connected with any such mine, or with the control, management, or direction thereof by the manager to be dangerous or defective, so as, in his opinion, to threaten or tend to the bodily injury of any person, he may give notice in writing," and so on. He may go further than that. If remedy is not applied immediately he can report to the Secretary of State. You say he ought to have further powers, and without reporting to the Secretary of State that he might be empowered by law to compel managers to do anything he thought right in the re-arrangement of districts ?—Yes, that is our position.

24412. Then you say that no person for any cause whatever should have power to call a deputy away from the district over which he is in charge, except the person in charge of the mine for the time being. I suppose nobody could have the power to compel a deputy to go away from a district of which he is in charge except the under-manager or anybody in charge of the mine ?—We want to have that made very explicit and compulsory. It is common now in small districts where there is not sufficient work for a deputy to do, to give a deputy certain duties to do outside of his district altogether, such as shift work, which would take him away from his district.

24413. It is only the under-manager who does that ?—The management in some instances. In the event of anything going wrong with the working, supposing there was a stoppage of work outside the district of which the

Digitized by Google

deputy has charge, it is a common occurrence for a trolley-way-man or any man immediately concerned with that kind of work to immediately call for the deputy, and if he does not go at once he has to give an account, and often he has to leave his men unsatisfactorily provided for. Our Association wants something to prevent this being done, and they want a deputy not to leave the district over which he has charge, unless the orders come direct from the person in charge of the mine at the time, either the under-manager or the manager.

24414. He is not bound to take any notice of orders that do not come direct from the under-manager or the manager? —He is sometimes not pleasantly treated if he does not do it.

24415. Then you advocate the prevention of deputies drawing timber during working hours at the face. Do you mean that all timbering should be done between shifts?—Yes. We want the same thing as to shot firing. We want deputies to be relieved from timber drawing altogether, and to have timber drawing set apart just as shot firing. I think you will see the necessity for that: in the longwall working, particularly, it is the duty of the deputy who has charge of the district in every shift he goes round, to go into the face where the men are hewing occasionally, and the tubs are going in and out, and wherever that noise is going on it is not safe for him to do so. In the next place it is not safe to the men left working in the face after the deputy has left, because it is a common thing, after he is there with the wall behind the packs, for these places to close up. The men complain daily, but the management insist upon the timber being taken out, and we consider, in the interest of the hewer and for the better protection of the deputy, that this ought to be done apart from deputy work, done, say, at night.

24416. It has been suggested to us in some cases that it is so dangerous to draw the timber that it ought not to be drawn at all?—There are cases where we consider that it ought not to be drawn ourselves. In any case it is very unsafe for a deputy to have to draw timber while the men are filling coal in the tubs with their shovels, and the tubs going in and out. He cannot hear any warnings, and after he has left the face there is danger for the men to be working until the place has got really settled. Not only that, but it is not an uncommon thing for there to be a blow of gas after there has been a lot of timber drawn.

24417. With regard to your 25 years' experience as a deputy, where have you had it?—At Westwood Colliery, that one colliery alone.

24418. Before that did you work at any other colliery?—I did six months' deputy work at Burnhope Colliery before I went to Westwood, but I do not take that into account.

24419. The whole of your experience has been at Westwood?—Yes.

24420. (*Mr. Enoch Edwards.*) Would you mind defining to us the duties of a deputy?—The duties of a deputy are to examine all the main roads, intakes and outlets, and follow his men in the face, to see that all his refuge holes are kept clear, supply his men with a proper supply of timber of the right lengths, and anything that tends to the general preservation of the hewers' life, and everybody under his charge, and also when he leaves him to leave him in a position that he will be able to keep himself safe.

24421. Besides the manager, the under-manager and the deputy, have you firemen now?—Shot-firers?

24422. Yes?—No.

24423. The deputies do all the shot firing?—The deputies do not at our colliery.

24424. Who would do it?—The stonemen fire them themselves. There are no shots fired at our place.

24425. Ordinarily who would fire when shots are fired?—If there were any coal shots to be fired, do you mean?

24426. Yes?—The deputy would either fire them, or some of the stonemen, who had a licence to fire them.

24427. Licensed shot-firemen?—Yes.

24428. Any man having such a licence would fire the shots?—Yes.

24429. This suggestion of yours that no deputy should be allowed to fire shots whilst having to follow his ordinary duties at the face applies to your county, and not to your particular pit?—Yes, we represent the county.

24430. You have had these questions before you as a body, and have considered them as a whole?—Yes.

24431. You have come to the conclusion that where shots have to be fired the deputy should not be called upon to fire them while following his ordinary duties, but if they are to be fired at all that there should be a special man to fire them?—Yes.

24432. When you say that no person, for any cause whatever, shall have power to call a deputy from his district, if the under-manager or the manager does not call him away, who does?—In some cases it is the trolley-way-man.

24433. The manager of the pit, first of all, is the general officer of the colliery?—Yes.

24434. The under-manager is the next?—Yes.

24435. There is nothing between those two and the deputy?—No.

24436. Who has power to call you in the absence of the manager or the under-manager?—Nobody has power, according to the Act.

24437. In practice who has power to call you?—Nobody has power in practice, but it is a practice that is carried out nevertheless: they have not the power to do so, but they assume the power.

24438. (*Mr. Ratcliffe Ellis.*) Who is it?—There are the trolley-way men who are in charge of the districts. Supposing a driver goes off a long way with a load of tubs, and it is not convenient to attend to them at the time, he will send for the deputy to come and put it right. If the deputy does not come he is taken to task by either the manager or the under-manager for not seeing that the work is being got on in his district. We want to have it that that man shall not have the power to send for us.

24439. (*Mr. Enoch Edwards.*) I want to get to the bottom of this. There are only two people above you in the mine, the manager and the under-manager?—Yes.

24440. Do you suggest that other people may order you about?—Yes. I suggest that is a county practice.

24441. This man has no control over you?—According to the Act he has no control whatever.

24442. Get outside the Act for the moment. In practice would he have power to employ or discharge you?—Not at all.

24443. You are not under his control?—Not at all.

24444. How does it come about that you are called upon to obey his orders? Have you had that instruction from the manager?—It is the practice in the county.

24445. I understand that, but you have had instructions from the manager or the under-manager that you must obey this man if he calls you to put a load of wagons on the road?—Not in the particular colliery, but it is a county complaint that that is so.

24446. That the under-manager or manager has given instructions to the deputy to obey this man's orders?—To obey anybody's orders to get the work out.

24447. Hardly anybody's orders?—Anybody who is interested in getting the work out—anybody that has any charge in the pit at all.

24448. (*Mr. Ratcliffe Ellis.*) Somebody says to you that the things are off the road and it is blocked, and you consider that you must get it open or the whole place will be stopped. If that happened, the manager would come and say "Why does this happen?"—Yes.

24449. (*Mr. Enoch Edwards.*) It happens in practice that besides the manager and under-manager, other people call for your services for anything they like?—Yes.

24450. That you object to?—Yes.

24451. You think you have strictly definite duties to attend to?—Yes.

24452. All those duties tend to the safety of the men?—Yes. I may say this, we do not object as far as we have time to do it, but we object to be called away from the face when we have duties demanding our attention at the face.

24453. You suggest that some of the districts having a very large area to get over are bigger than you can get round?—Yes.

24454. And that already you have more work than you can attend to?—Yes.

24455. You suggest in addition to that, although you have more work than you can do, it is open for the trolley-way-man to fetch you from the work you are already overburdened with, to do other duties?—That has been the practice.

Mr. James Clark.

26 June 1907

24456. Is it a common practice? Does it happen often?—It is a very common practice in the county.

24457. What steps do the deputies take in this pit to remedy it?—They appeal to the manager or under-manager to be relieved, but this is where the dissatisfaction comes in between us and the management. The manager contends that we have not over much work. The deputy contends that he has over much, and hence the dispute arises between the parties. Who is to settle it? We consider that it is time to call in the inspector to say.

24458. You heard the Chairman read out the copy supplied by Mr. Ellis of the paragraph relating to the powers of an inspector?—Yes.

24459. Has it ever occurred to you as a body to make representations to the inspector?—No.

24460. You have not done it?—No.

24461. What has been your reason for it?—We have not had any particular reason, I daresay, for it.

24462. Have you thought, for the time being, under the law that he had no such power?—We did.

24463. You think that may be the reason why you did not?—We thought his powers simply allowed him to make a recommendation, but that he had no power to enforce his recommendations. We want the inspector to have power to enforce what he believes is reasonable.

24464. If it is a question of the inspector deciding what is a fair amount of work for a deputy to do, you may be right—I mean as to what he is capable of doing, or ought to do. What you want to put before the Commission with regard to safety is, that when you are in charge of these men at the face you should not be drawn away from the work, thereby seriously affecting the risk to the men who are working there?—Yes.

24465.—With regard to the prevention of deputies from drawing timber during working hours at the face; that is a part of the deputy's duty, to draw timber?—Yes.

24466. It is not a part of the collier's duties?—No.

24467. Or to set it?—Except for his own safety.

24468. In your absence, if there is a place dangerous, he has to put it up?—Yes.

24469. Drawing he has nothing to do with?—No.

24470. Are you compelled to draw all this timber?—It is possible to draw it. We are frequently found fault with because it is not cleaned. It is to the advantage of the deputy and coal-hewer and the colliery on the whole, if the timber can be cleaned.

24471. That is the proper management of the face of coal?—Yes.

24472. You complain of drawing timber during working hours?—Yes.

24473. What is there to prevent you now leaving drawing that timber until the pit has done?—There is nothing to prevent it that I am aware of, if we were allowed to do so. It could be left and done at nights.

24474. Have you ever put that question seriously to the management?—We have suggested it, but we have never tried to enforce it. We have never put up props sufficiently strong, but we have suggested to the management on more occasions than one.

24475. You suggest to the management that there is an element of risk in drawing this timber while working? What is their reply to that?—Many of them consider that there is no risk. They think it can be done quite easily, and that there is no particular risk.

24476. In those cases have they seen the working faces themselves?—Yes, they travel the face.

24477. The under-manager?—Yes.

24478. Does he travel it every day?—They travel different districts.

24479. The manager does not travel it?—Yes, occasionally.

24480. The under-manager travels it every day?—Yes, one part of the district one day, and another part another.

24481. In merely travelling through a coal face, is it possible for the deputy to know of his own knowledge the seriousness of drawing those back timbers unless he looks?—The under-manager, do you mean?

24482. Yes?—If he looks he cannot do otherwise than see.

24483. In going through the faces would he make it his business to look at the back timber?—Invariably he should; I could not say he always does it.

24484. It is included as part of his duties that he should do it?—Yes.

24485. It is a question of his judgment against yours—that is the position?—Yes.

24486. Are you asking that the inspector shall decide the point between your judgment and that of the under-manager?—In the case of timber drawing we do not ask for the intervention of the inspector. We ask it to be binding that the deputy shall not draw timber during the day, hence it does not require the intervention of the inspector at all.

24487. There are no physical difficulties in the way of drawing this timber after the shift is done?—I am not aware of any. I might say in the drawing of juds, where they are not working longwall but board and pillar, that the jud comes off during the day and stands till night. It is sometimes to clean to get to the next place the next morning. It might interfere with that, but that could be overcome by the shifter going in a little sooner and getting it clean and drawn, and there is any amount of time to get ready for the next morning.

24488. In following out your duties what you have to say now has reference to the coal face?—Yes.

24489. Who is responsible for timbering the roadways—the deputies?—Yes.

24490. That is part of their business, to see that the timber in the roadways is good?—Yes.

24491. If it had to be replaced with fresh timber they would have to do that?—Yes, all places leading to and fro where the men are working.

24492. You do not suggest that comes in the same category as being done after the pit is finished?—Any that is drawn; but the setting of timber we do not; just the drawing of timber.

24493. You have to replace timber in a main road even that is broken down?—Yes, if the timber gets broken.

24494. The deputies do that?—Yes, they could not do otherwise.

24495. Is that done during the working of the pit?—In some instances where it is not safe to go all day, but if, in the judgment of the deputy, the place is safe to go till night, it stands over and the shifters do it at night.

24496. They would be under the charge of the deputy?—There is not a complaint against a deputy for it.

24497. The shift would be under the charge of somebody?—Under the charge of the master-shifter, and they have a night shift deputy.

24498. The master-shifter would have authority to do it. He is selected for that office because of his capacity?—What work we do is done during the day, and the master-shifter at night instructs the shifter to do it.

24499. I should like to ask you a question with reference to certificates for this class of men. Is this a matter you have discussed between the deputies, that they should hold certificates of competency?—It has not been a question of open discussion at our councils, but the thing has been very much discussed, I daresay, locally throughout the county.

24500. Do any of your deputies hold second-class certificates?—Not a great number, but a number do—not such a large number.

24501. Do you think it advisable that this class of man should have some certificate of competency?—A second class certificate, do you mean?

24502. Yes?—I daresay that is the feeling generally throughout the county by the deputies.

24503. A certificate that would warrant a manager in the belief that the deputy was competent to discharge all those duties?—Yes.

24504. That is, that he must have had considerable practical experience and practical knowledge, and obtained a certificate. There is no difficulty in the mind of the man who employs you when you understand the work?—Yes, and, I daresay, that is the general feeling of the county, that that ought to be the case.

Digitized by Google

24505. (*Mr. Ratcliffe Ellis.*) Is this Deputies' Association an association apart from the Miners' Association ?—Yes : it seceded from the Miners' in 1875.

24506. You have an association of your own ?—Yes.

24507. You have had a meeting of your members to discuss the questions that have been submitted to the Commission ?—Yes.

24508. The answers you have given to-day do not apply to yourself particularly ; for instance, you have no shot-firing ?—They do not apply, individually, to our colliery, but they apply to the county at large.

24509. So far as shot-firing is concerned, that does not apply to you, because you have no shot-firing at the face. With reference to the complaints of over-work, is your own district too large ?—I could not say that we are labouring so much under that just at present, but the work varies. The districts worked vary occasionally, and sometimes they are overtaken by faults, which require the men to be shifted, so that at one time you have an over-large district, and a fortnight or so after that you are in your normal condition again.

24510. Take your own case : have you had any complaint ?—At present we have not.

24511. Have you had times when you have had too large a district ?—Yes.

24512. What did you do then ?—I appealed to the under-manager.

24513. What was the result ?—I daresay, in most of the cases, if not all, we have got redress ; but all managers are not alike.

24514. As far as your own personal experience goes, where you have found the district too large and you have complained, it has been redressed ?—Yes.

24515. With regard to persons calling upon you away, is it part of your duty to see that the roads are kept clear ?—Not according to the Act.

24516. But according to your agreement with your employer ?—There is no agreement entered into, that is, in that respect.

24517. You have certain duties to perform as a deputy ?—Yes.

24518. Is one of those duties to see that the roads are clear, so that there is no block in the traffic in going along ?—The manager looks upon that as a responsibility upon our part.

24519. If you are engaged at the face in your inspection, and a messenger comes to you to say that the road is blocked because there is a tub off the line, you do not personally go and put it on ?—We go to assist.

24520. You go to see that somebody else does it ?—It is a common thing to have to go and do it yourself.

24521. That is part of your duty, to see that the place is kept clear ?—Yes.

24522. It is not anybody ordering you ? When you get information that there is something wrong, it is your duty to see that the block is removed ?—It is a part of the duty which the manager is trying to devolve upon us, which we are objecting to.

24523. It was rather put that somebody ordered you to do something. At present it is your duty, rightly or wrongly, to see that the roads are kept clear for the traffic ?—We do not admit that it is a duty.

24524. You do it ?—The manager looks upon us as being bound to do it as a moral duty, but we shrink from it ; we object to it.

24525. It may be right or wrong, but at present it is recognised as part of the duty of a deputy, that he must see that any block in the road is removed ?—Yes.

24526. A messenger comes to you to say that the road is blocked and that the tubs cannot go along it, and you have to see that it is removed. That is the position. You want to be relieved from that position ?—Yes.

24527. Whom do you say should be responsible for seeing that the block is removed ?—The man who has charge of the drivers, a trolleyway-man. He ought to go, and if he cannot manage it himself, let him get the putters or some of the other drivers.

24528. I do not see what harm there is in sending for you as being the person in charge. Supposing there is a block, it is for you to see that that block is removed and traffic is restored ?—I have said that we do not object to do anything that we have time to, but a deputy has duties in the face that want to be attended to, and a message comes that he has to assist to get a tub on the line. He leaves the face to go back to get the work away, and in his absence something occurs at the face.

24529. Your point is that you have sufficient to do at the face without having to see that the traffic is kept going on the roads ?—Yes, that is our position.

24530. What have you to do at the face ?—We have to get all the timber for the hewers and make their places safe, and examine the goaf edges and places throughout to see that there is no gas, put up the canvasses to keep the gas clear, and when we leave we have to leave a sufficient supply of timber for the men to keep themselves safe in our absence.

24531. Your view is that that is sufficient to occupy the time of the deputy without having to do other work, such as seeing that the roads are kept clear ?—Yes, the tramways where the putters have to put, and the drivers are driving, we have to see that they are kept right as well.

24532. You think that your duties should be confined solely to seeing to safety at the face ?—Yes.

24533. The deputies in your county set the timber ?—When they are in the face, if there is any necessary to be set. In their absence they leave lengths for the hewer to keep himself safe. If they want any set when they go in, it is their duty to set it for them.

24534. My impression was that you have to see the timber right when the hewer goes in, but that he has to see to it afterwards ?—No, after we go out.

24535. You have to see that the timber is right when he begins work, and during the day inspect the places to see that he puts up what is necessary for safety during the day?—Yes.

24536. You are a skilled timberer, it being part of your duty to set timber. Your are a skilled man in that way ; it is your duty also to withdraw the timber ; is that so ?—Yes, at present.

24537. Do you say you have not time to withdraw the timber ? Is that your objection ?—No, that is not our objection.

24538. What is your objection ?—Our objection principally is that it is not safe for the deputy to draw during the day. It is not safe for himself, and not safe for the hewer to hew after the deputy has drawn the timber.

24539. Have you had any accidents in consequence of that ?—Yes.

24540. In consequence of the timber being drawn during the time the deputy was at work ?—Yes.

24541. Your time of work runs along with the hewer. When the hewer has finished you have finished ?—We have finished in the face, but we have to see them out of our district.

24542. That is the time that the timber should be withdrawn ?—Yes.

24543. How many coal-getting shifts do they work ?—Do you mean the coal hewers ?

24544. Yes.—Eleven shifts.

24545. No, how many shifts in the 24 hours ?—Two shifts.

24546. Are there some collieries in Durham where they work three shifts ?—Yes.

24547. Are there many ?—At most, I daresay, of the eastern collieries where the large collieries are, they work three shifts.

24548. When does the first shift go down where they are working three shifts ?—They go down at four o'clock in the morning.

24549. When does that shift end ?—The back man goes down at ten, and in the face they arrive at eleven o'clock.

24550. There is no time between those two shifts to draw timber ?—No.

24551. When does the third shift go down ?—I could not say. I think it is six o'clock.

24552. These shifts work about seven hours at the face ?—Seven from bank to bank, not more than five on an average in the face—scarcely that.

24553. Where there are three shifts working, when would this timber be drawn ?—The coal-hewer has done hewing shortly after three o'clock in the back shift.

24554. That is the second. What about the third ?—Say the third does not go down till six, then it is near seven before he gets there, and there is practically three hours to draw timber.

Digitized by Google

Mr. James Clark.

26 June 1907

24555. Is that the time during which you suggest the timbering should be drawn?—Yes.

24556. Whom do you suggest should draw the timber?—We suggest that men should be specially appointed for it.

24557. Is there enough work for specially appointed men?—Where there is longwall there is sufficient work.

24558. At the present time you look after many things and draw timber, too?—Yes.

24559. If a man had nothing to do but draw the timber, how long would it take him to do it?—There are districts where it would take him his whole shift to do it; it would take more than one.

24560. It does not take you all that time?—No.

24561. In your case how long would it take a man to draw the timber which you have to draw?—There are districts in which it would take more than one, but where there is not there is sufficient shift work, such as making places ready.

24562. Take your own case. What time does it take to draw the timber?—That would be difficult to get at, because ours is longwall working, and we have to go twice round the face in the day, and we take so much in both shifts.

24563. You do it yourself. The result of that is that you help the colliers?—Yes, but at a risk.

24564. So far as you are concerned you do it with your other work. This special man who is going to be appointed in your own case, how long would it take him to do it?—The amount of drawing that there is in the two shifts in my district I should say would take a man his shift to do to draw it at night.

24565. You must be pretty hard pressed if you have to do that and all your other work?—Yes, we are.

(*Mr. Smillie.*) The man he proposes would deal with two or three shifts.

24566. (*Mr. Ratcliffe Ellis.*) A man cannot stop down more than eight hours if the Eight Hour Bill is passed. You would want a man for each shift?—No. After the two shifts were finished one man going in with somebody else to assist him would take away all the timber necessary to be taken out for that day for the two shifts.

24567. It means two more men would have to be appointed for the purpose of drawing the timber?—Yes.

24568. In your view that is really necessary for safety?—Both for the safety of the deputy and the hewer himself.

24569. With reference to shot-firing, it does not apply to your colliery, but you are acquainted with the facts at other collieries. Take a colliery where coal shots are fired. Do you know such a colliery?—Yes.

24570. Are the shots fired between the shifts or during them?—During the shifts.

24571. Do you know where they are fired between the shifts?—No.

24572. Where they are fired during the shifts the deputy fires them?—Yes.

24573. With a competent man and a licensed shot-firer?—Yes.

24574. Is it because he has not enough time to do it that you want a shot-lighter appointed?—Partly because he has not time to do it, and at the same time we regard the haste he has to do it in. He is not able to give that sufficient care to the firing which is necessary.

24575. It comes to the same thing; he has not time to do it?—There is danger in doing it.

24576. Has your district many accidents from shot-firing?—There are a good many accidents through shot-firing.

24577. Happening because it is done too hastily?—It would be largely minimised if there was time.

24578. You think that this shot-firer should do nothing but attend shots?—Attend shot-firing first, and if he has not sufficient work to do in firing shots, there is sufficient to help in keeping the district right.

24579. He is to do that, too. What has he to do besides firing shots?—There are always places to be made ready for the men to get to.

24580. Is he to do that?—I said if there is not sufficient work in the face to fire shots, that there is always work to fill up his time.

24581. Would he fill time doing the deputy's work—putting timber up?—Not till he has fired his shots.

24582. His duty would be to fire shots and do deputy's work?—I would not say that is right.

24583. You say if he has not sufficient shots to occupy his time that he would see the places were right; that is deputy's work?—Not deputy's work. Sometimes one place is finished and there is another place to make ready. That is regarded as being ordinary shift work.

24584. Who does that now?—Shifters. They have a class of men known as "shifters," who do this class of work.

24585. Is he to do the work of a shifter as well as a shot-lighter?—If his time is not fully occupied in firing shots. He first of all discharges his duty as a shot-lighter. There are some districts where the deputies fire four or five shots each, and there are other districts where the deputies fire, on the average, 30 shots a shift. That and carrying a cable and his battery and his detonator, and all the things with him for the purpose of firing the shots is too much for him to carry about.

24586. That is the deputy. Take a case where there are four shots to be fired. That is not too much for one man?—I say that man could fire the shots, and if there was not enough work there would be sufficient shift work to employ the rest of his time.

24587. It would not be a man who fired shots and nothing else, but he would also do shift work?—Yes.

24588. That is your idea?—Yes; it frequently happens now, when a deputy has not sufficient work, that he fills up his spare time by doing shift work.

24589. The deputy can do that again if he has time to do it?—Yes.

24590. He has not time to do it, you say?—No.

24591. With reference to the question of the inspector, you suggest that if the manager and the deputy do not agree as to the size of the district and the work he has to do that there should be an appeal to the Mines Inspector?—Yes.

24592. Would you prevent the manager discharging the deputy?—Most certainly, without he gave some just reason for so doing.

24593. Is there anybody about a pit whom a manager is not entitled to discharge now?—Not without a reason. He could not discharge them.

24594. Not by giving them a fortnight's notice?—But he must give some just cause why he has dismissed him.

24595. Where do you find that?—That is the custom.

24596. There is nothing in the Act with regard to that?—No, but it is the history of the coal trade.

24597. Do you propose to put a fireman on a different level from anybody, except the checkweigher?—No, there is no other man labouring under the same responsibility.

24598. Your view is, if a manager is dissatisfied with a deputy, that he cannot discharge him?—If he is satisfied that he is not a capable man he can give just reasons to show that, and refuse to take the responsibility of his appointment, and discharge him. That we never object to; but for a manager, because a deputy complained he had over-much work, to have the power to discharge him, we protest against that.

24599. He has that power now?—I have not seen that, according to the Act.

24600. I cannot see anything in the Act which prevents him having that power?—I have not seen anything in the Act to give him that power.

24601. You think that is the law. If a manager is dissatisfied with a deputy he cannot discharge him without giving a satisfactory reason?—No, he cannot.

24602. Supposing that the reason is not satisfactory to the deputy, what has the deputy to do?—He appeals to the owners.

24603, Supposing the owners say that they think that the manager is right, what happens then?—Then we take it to a higher court.

24604. What court?—If they dismiss him unjustly, we can appeal to the County Court.

24605. If they give him notice to terminate his engagement, you cannot do so. But he must give some reason why.

Digitized by Google

24606. Is that the rule in your county?—That is the custom.

24607. They cannot discharge a man by giving a fortnight's notice, but must give a satisfactory reason?—They must give a satisfactory reason as to why he is discharged.

24608. And if the reason is not satisfactory to the deputy, he can take him to the County Court?—Of course we would do that. We have not done that, but we would do that.

24609. Is that your view of the law in the County of Durham?—It is the law in the history of the coal trade right through the coal-field.

24610. So far as the Inspector is concerned, you propose instead of your having now the power, as you say, of taking him to the County Court, that the Inspector should be appointed as a judge between them?—Yes.

24611. That is your view of what the change should be?—We would submit to his decision, whether it was against or for us.

24612. Suppose the Mines Inspector decided that the manager was wrong, and he had to retain a man he thought was incompetent, would you relieve the manager from any responsibility that might arise in consequence of this deputy being retained?—I do not think there would be any special responsibility placed upon the manager for the retaining of this deputy.

24613. The manager is responsible if anything goes wrong?—Yes.

24614. He is responsible, if he does not appoint a competent man. If you, or the inspector, impose upon the manager a man who turns out to be incompetent, and trouble happens in consequence, would you relieve the manager from his responsibility?—If he can show that the man is an incompetent man, we should certainly agree with him in dismissing him.

24615. Supposing that there is a difference of opinion, and the inspector says: "You must retain that man," and he retains him, and trouble happens in consequence of that, would you relieve the manager from the responsibility which the Act now imposes upon him?—Decidedly, if the inspector's opinion was that he was a competent man.

24616. As to certificates, I think you said there should be a third-class certificate?—Yes.

24617. Would not the second-class be sufficient, instead of establishing a new examination?—The second-class certificate, which it is necessary for a man to hold, in order to occupy an under-manager's place, would not be necessary for the fulfilment of a deputy's duty.

24618. I am told that the deputy is the most important man about the place?—So far as his own district is concerned, in the absence of the under-manager.

24619. Whatever the district may be, the deputies go all over the pit. Would it not be sufficient if he had a second-class certificate?—To hold a deputy's position?

24620. Yes, if he wants a certificate at all?—I would not say that that was necessary.

24621. (*Mr. Wm. Abraham.*) It is more than sufficient. A second-class certificate that has to be passed now is more than sufficient?—More than sufficient for a deputy.

24622. (*Mr. Smillie.*) If more than sufficient, it would be sufficient?—Yes.

(*Dr. Haldane.*) What is the qualification of underground experience in the case of second-class?

(*Mr. Smillie.*) Five years.

24623. (*Mr. Ratcliffe Ellis.*) What examination do you suggest that a deputy should be subjected to?—That is a thing which we have not gone into in council. What I say is my own opinion. I say that a man should give some guarantee that he has had some experience in the face as a timberer, and should understand the nature of the strata, and have a thorough knowledge of the General and Special Rules, and that he ought to be a man who would give sufficient proof that he was interested in the discharge of the duties relating to a deputy.

24624. I should think if a man proved that, he would get a second-class certificate. You do not suggest what the nature of the examination should be, but you think that there should be an examination conducted by the Home Office in the same way as the examination for first and second-class certificates is conducted, but less stringent than the second-class?—Yes.

24625. And that they should have certificates?—Yes.

24626. With reference to your roads, the deputy's duty is to see that the roads are clear?—From the position of the manager.

24627. You have it to do now?—Yes.

24628. Do you find that your roads are blocked up at the side so that people cannot pass between the rail and the side, I mean by debris?—No.

24629. There is always plenty of room for people to pass? We always see to that. There are collieries where they do the same thing, but there are some where they cannot do it; they have not time.

24630. Do you consider it part of your duty to see that is so now?—Yes.

24631. In fact, the whole burden of your evidence is, you suggest that there is too much work put on the deputy—Yes.

24632. And you think in the interest of safety that that work should be sub-divided?—Yes.

24633. You think that shot firing, and the drawing of timber, should be taken away from him, and that he should not be required to see to the carrying on of traffic satisfactorily?—Yes, not to be responsible for it. He will do it as far as he has time, but he does not think he should be responsible for it.

24634. (*Mr. Wm. Abraham.*) As to the certificate, what you think is necessary, is that the man who has to be employed as a deputy, should have given some proof of his ability to do that work thoroughly?—Yes.

24635. You are not concerned with whether he should have a first-class, a second-class or a third-class certificate, if he can prove that he is able to do that work thoroughly?—Yes.

24636. You said, in distinct language, that it is your duty to see that traffic is kept going?—The manager looks upon us in that respect.

24637. You are doing it?—Yes.

24638. Is there any rule, either General or Special, by which that part of the work is designated to you?—No.

24639. There is no law compelling you to do what you do outside your duties, I mean as specified by the Special Rules?—There is no law compelling us.

24640. You are not told, when you are engaged as a deputy, that you are to do it?—No.

24641. Is it the sort of thing which you have to do, and not discuss?—Yes.

24642. What you object to is this, if I understand you rightly, not that you are unwilling to do the work in the district, but that you are obliged to leave some important thing in your district to attend to other things outside your districts?—Yes, occasionally.

24643. You are called out to raise a tram when you are engaged at the time doing something far more important inside the district than that?—Yes.

24644. If you do not do it, you are considered not to have done your duty?—Yes.

24645. As a class of men you want to be relieved from that obligation?—Yes.

24646. You said at your colliery that the districts you have to examine are not too large. As a member of your Association, do you know of districts that are considered by the deputies to be too large for them to attend to properly?—I could not say what collieries, but general complaints have been made at our Council meetings.

24647. Do they come from men working at collieries?—Yes.

24648. It is not the case at your colliery, but it is the case that complaints come to your Association from men at other collieries?—From the representatives of other collieries.

24649. All that you want is sufficient time, and a district of such a size, that it will enable you to do your work efficiently, as examiners and deputies?—Yes.

24650. (*Mr. F. L. Davis.*) You say that these complaints have come to your meetings from various collieries in your district?—Yes.

24651. Could you name any of the collieries?—I have said, a minute ago, speaking from memory, that I could not. With regard to the districts being too large, I said that at our colliery we have got redress, but our colliery

Digitized by Google

Mr. James Clark.

26 June 1907

is an exceptional colliery in the county, and the under-manager is one of the most exceptionally reasonable men. Appeals to him would be successful where they would hardly be successful in 99 other cases.

24652. If this is the only colliery you have worked at for so many years, might that not also apply to other managers you do not know ?—For the past 16 years I have been General Secretary of this Association, and my experience, from enquiring into cases of this kind, has taught me that I have not come across his equal very often —in fact, very seldom.

24653. (*Chairman.*) It might be as well, if you want to prosecute this question of managers, refusing to listen to complaints as to districts being too large, if you could produce somebody who had filled the position of deputy, and who was now in some other work and not subject to the influence of the mine owners, who could give first hand evidence as to anything of that sort having happened ?—The question suggests itself to me now, is my statement accepted or is my statement considered doubtful ? That is the question.

24654. (*Mr. Ratcliffe Ellis.*) You have nothing to fear from your manager ?—No, I would not have any fear with our manager, but, as I have said, he is an exceptional manager, and I am sorry there are not more like him in the county.

24655. (*Mr. F. L. Davis.*) I will not press the witness to give the names of the collieries or the men. You quite understand I was not disbelieving anything you said. When a manager engages a deputy he tells him what his duties are ?—It is a common practice to do so. If there is a vacancy in the case of a deputy the men in the colliery are generally acquainted with what the deputy's work is, and he is generally appointed to fill a position rendered vacant by some other person. If there is any particular matter the manager does mention it.

24656. He knows his definite duties and the manager tells him if there is anything wrong in the road or anything stopping the work he is expected to put it right. Does he not give you general instructions ?—It was not done with me.

24657. Perhaps he thought you know the work so well that it was not necessary ?—No ; when a man is appointed a deputy he is furnished with a copy of the special rules and the bye-laws, and at the same time with the licence and the keys, and he has to understand his own duties.

24658. Generally speaking, the man who is appointed a deputy has been working for some time in the pit ?—There are exceptions, but as a general rule that is the case.

24659. Can you give any instances of accidents that have occurred from drawing timber during the shift ? Your reason for wishing that duty to be taken off the deputy is because it is a danger to him and the other men ? —We have not taken a census of that, but from the number of deputies who have been lamed, and the number of non-fatal accidents which we have had, and for which compensation has been paid, we know they generally arise from the drawing of timbers.

24660. During the shift ?—Yes. I am not aware of a deputy who has been killed since the passing of the Compensation Act apart from drawing timber during the shift. He has always been killed in drawing timber.

24661. (*Chairman.*) Do you mean every accident to a deputy ?—Yes, with the exception of one deputy who was killed with his jack tram on the engine plane.

24662. How many have been killed or seriously injured ? —We have generally about two during the six months.

24663. Do you mean either killed or seriously injured ? —I mean two fatal accidents during the six months.

24664. About four accidents to deputies alone in the 12 months ?—Yes.

24665. That is in the county of Durham ?—Yes.

24666. You say that there is an average of two fatal accidents to deputies every six months ?—It will work out about two in every six months.

24667. That is about four a year ?—Yes, but I may say this : we have been remarkably fortunate this half year. This six months we have not had one, and we have passed a remark about it more than once.

24668. (*Mr. F. L. Davis.*) If you left the drawing of the timber until after the shift was over would that be in your shift or in the next deputy's shift ?—It would affect both our shifts. Neither I nor my man on the work would have timber to draw, but it would have to be done by a man in the night shift after the day shift was done.

24669. Instead of drawing the timber you do now you would have it taken off your shoulders altogether ?—Yes.

24670. It would be somebody else in another shift who would do the work ?—Yes, and we would have more time to devote to the protection of the men whose lives we have to take care of all the day.

24671. We have had a number of questions with regard to the wages of deputies in the different districts. Can you tell me about what the wages are that a deputy gets in Durham ?—The face wage from the deputies in Durham is 4s. 8½d. upon the 1879 basis, plus the per cent.

24672. (*Mr. Smillie.*) That is 40 ?—Yes ; it works out at about 6s. 7d. per shift now.

24673. (*Mr. F. L. Davis.*) Is that his total wage ? Is there anything else which he may get to make that pay ? —No. There is what we call the back bye wage when a man is not following his men is the face. He is working on shift work when the pit is not getting coals, doing repairs in the pit, drawing timber, and then he has 4s. 2½d. plus the 40 per cent.

24674. That is about £2 a week ?—Yes, it will work out at about £2 a week for the full time.

24675. (*Mr. Smillie.*) Has he a free house and coal ?—Yes, where we have not free houses we have rent.

(*Mr. Smillie.*) In addition to that it works out at 5d. per shift.

24676. (*Mr. Ratcliffe Ellis.*) What is the county wage for the hewer ?—I am not sure what the county wage is.

(*Mr. Smillie.*) 4s. 2d., plus 40 per cent. ; on the 1879 basis 4s. 2d.

(*Mr. Ratcliffe Ellis.*) It is about the same.

(*Mr. Smillie.*) Yes, with a free house.

24677. (*Mr. F. L. Davis.*) Is it your opinion that the deputies in Durham are capable men ?—Yes, we regard them as being capable men.

24678. (*Mr. Smillie.*) Have you any experience of pillar and board working ?—Yes.

24679. Is that the same class of working as we call stoop and room, narrow places and pillars left in ?—20 yard pillars and 4 yard boards.

24680. They take out the pillars in lifts of sections ?—Yes, 10 yards each way.

24681. They put in the timber to keep up the roof until 10 yards is cut ?—Yes.

24682. Then they draw the timber ?—Yes.

24683. That is a dangerous process, the drawing of timber in the pillars ?—Yes, that is what we object to.

24684. You require that everything should be very quiet when you are taking out that timber in order to enable you to hear the roof working ?—Yes.

24685. If there was a serious noise going on, such as the filling or running of trams you would not be sure whether it was safe to take the props out or not ?—Of course not.

24686. That is your experience ?—Yes, that is my experience.

24687. Does the same thing apply in longwall working ? —Yes.

24688. At the present time the deputies have to draw the timber while the coal getters are filling the trams ?—Yes.

24689. And getting their coals out of the back side ?—Yes.

24690. Over their head ?—Yes.

24691. What you complain of at the present time is that, even with quietness, it is a dangerous job, and it is more dangerous with the noise that is going on ?—Yes.

24692. Because you do not know whether the roof is working. The sounds from which the experienced man gets his warning he cannot hear because of the present state of the mines ?—No, sometimes we have to stop the men and the men complain about the loss of time.

24693. It is not their business really?—No.

24694. You say that this timber should be taken out by somebody at night when there are no men working at the face ?—Yes.

24695. So far as the deputies are concerned, they do not complain so much of the extra work as the danger of the circumstances under which they are withdrawn ?—There is not so much complaint as to the danger as there is of over much work to do.

Digitized by Google

24696. Supposing the district of the deputies was lessened to give plenty of time to do it, they would still prefer it being done at night when there is no noise ?—Yes.

24697. If you are correct in your figures, an average of four deputies has been killed at this place on work for some time past. Would you follow that up by saying that had the timbering not been drawn during the day the probability is that this number would not have been killed ?—Undoubtedly, the full number would not have been killed, but I could not say that in all cases.

24698. This can only be an opinion ?—It would minimise this loss.

24699. The danger would be considerably less if it was done at night by special persons appointed ?—Yes.

24700. The statutory duties of a deputy are to examine the working faces and all the roads leading to the working faces along which persons may travel ?—Yes.

24701. In order to ascertain whether there is danger from any cause ?—Yes.

24702. That is a statutory duty under the Act ?—Yes.

24703. Would you venture the opinion that the deputy in collieries, especially fiery collieries, is the most important person engaged in the mine as far as the safety of the workmen is concerned ?—Yes, in his examinations.

24704. As a matter of fact, the lives of all the coal-getters at the face in a certain district are in the hands of the deputy for the time being ?—Quite so.

24705. That, in your opinion, would justify the very best class of men being appointed for that purpose ?—Quite so.

24706. A deputy in a fiery mine, at least, should have a knowledge of explosive gases ?—Yes.

24707. He should also have a knowledge from personal experience of the nature of the roof and sides ?—Quite so.

24708. It would be a wise precaution, and assist the manager in the selection of a competent person, if it were made compulsory that the deputy should hold a certificate of competency ?—Yes.

24709. It would assist him in selection. You would not object to it being made a second-class certificate, I mean the present second-class certificate. He would be all the better for that, although you do not think the qualifications at present required by that certificate are necessary ?—They would certainly be all the better for it.

24710. There are a considerable number of miners in Great Britain, in Durham, amongst other places, who hold second and some first-class certificates ?—Yes.

24711. Who are not engaged as managers or under-managers just now ?—Yes.

24712. You have stated that the deputies of Durham are a good class of men. You do not doubt that, but there is not much encouragement given to draw the best class of men towards that employment. There is no extra encouragement ?—There is no inducement.

24713. I mean in the shape of wages, or even employment ?—No.

24714. I think the most important part of your evidence, and it is very interesting, is the fact that while engaged as a deputy looking after the safety of the working by timbering or putting up screens, he may be called away to assist in putting trams on the road that have gone off ?—Yes.

24715. That would indicate, in the opinion of the management, the most important part of your duty is to make sure that the material goes out ?—Just so.

24716. I think that is the general feeling of the deputies, taking your county. I do not ask you to speak for other counties. I think the general feeling is to make sure that the trams will not stop ?—Generally.

24717. You would not object to being called out by the under-manager or manager to do certain work where there were special duties, but you are at present called out by persons who are not in charge, I mean by the trolleymen ?—Yes. If the manager calls us out of the face he takes the responsibility upon himself.

24718. At present, supposing you are called away to assist in putting trams on the road, and something went wrong at the face in consequence of your absence, an explosion, or anything else, caused by your being taken away, you would be held still responsible by the mines inspector ?—Yes.

24719. And the Law Courts ?

(*Mr. Ratcliffe Ellis.*) As a question of law I think he would not.

24720. (*Mr. Smillie.*) Supposing a trolleyman sends in word for you that a train of trams is off the rails, and you are called out to assist to put them on, your position is, if you refuse to go, that it is reported to the manager or under-manager, and he talks to you about it ?—Yes.

24721. He blames you for not having gone ?—Yes.

24722. Because for the time being the work is not going on ?—Yes.

24723. Supposing you go out on the next occasion after being sent for by the trolleyman, and something goes wrong at the face, you would be held responsible ?—Yes.

24724. Because it is your duty to look after the safety of the men at the face ?—Yes.

24725. The mines inspector and the Law Courts would hold you responsible for that ?—Yes.

(*Mr. Ratcliffe Ellis.*) I could not assent to that proposition.

(*The Witness.*) And a little further.

24726. (*Mr. Smillie.*) Yes, I was going a little further, and say that in Court your duties would be quoted from the Act of Parliament against you ?—Yes.

24727. Would you not be told that you were not bound to obey the orders of the trolleyman ?—That is our position, and that is what we object to. In the event of his coming out, I mean, a boy or a trolleyman, and the inspector of mines coming in and finding the district without the charge of the deputy, the inspector considers that he has authority to demand his dismissal.

24728. As a matter of fact the position of your deputies and your own position is that they should be confined to their statutory duties under the Act ?—That is our position.

24729. And that they should not be requested to do work of that kind unless they are ordered to do so by the manager or under-manager for the time being ?—Yes.

24730. So far as your own colliery is concerned, have you any complaint to make that the districts are too large ?—Not at present.

24731. I want you to speak, if you can, from your personal knowledge or what you can prove. Do you know any districts in Durham in which it would be a physical impossibility for the deputy to thoroughly examine his district under the Act ? That is expected under the Act ?—I could not speak of any.

24732. From personal experience ?—Not authoritatively.

24733. You have not been in charge of a district which you could not examine within the two hours of the Act ?—No.

24734. And all the roads to and from the faces ?—Yes, travelling in one and out the other all the way.

24735. Do you know whether the workmen in the colliery where you are employed are so well acquainted with the escape shaft, so that if anything went wrong where they usually ride, they would be able to find their way to the escape shaft ?—Is that in relation to our own colliery ?

24736. Yes, at the present time ?—We have several day holes, drifts out of our pit. There are any amount of holes out of that.

24737. Your colliery must be exceptionally placed for that ?—We are very near the surface.

24738. What is the depth ?—22 fathoms to the bottom seam.

24739. That is very shallow ?—Yes. All our seams run out close to the bank.

24740. That would be rather exceptional. Is yours a naked-light colliery ?—Yes: we have no lamps.

24741. Do you know whether or not, as a general rule, the workmen are so well acquainted with the whole of the workings of the mine that they could find their way to the escape shafts ?—I could not speak for other collieries.

24742. You are not aware of that ?—No.

24743. I am astonished at the statement you made to Mr. Ellis, when you said, if a deputy was dismissed by a manager without any apparent cause, unless he could give good reasons for dismissal after giving the fortnight's notice, he would appeal to the Law Courts. Is that so, really ?—We have not an agreement to that effect, and there is no law to that effect, but I understand we would do it.

24744. I understand that your Association would protect you in a case of that kind. I, with Mr. Ellis, am astonished to hear that you have any appeal to the Law Courts, or

Digitized by Google

Mr. James Clark.

26 June 1907

that you would think of it. Mr. Ellis and I are of opinion that a colliery manager may dismiss a deputy, or even an under-manager, by giving the ordinary fortnight's notice. I understand that the Association, of which that person is a member, would protest as strongly as it could that the manager should give some reason for doing so, and might bring a colliery out on strike to prevent it being done. Have they any appeal at law?—My position was this: we would test an appeal case.

24745. You have never done so?—No.

24746. (*Mr. F. L. Davis.*) He also said it was the custom in the coal trade that a reason should be given.—My answer to the question was this: In the case of a deputy being dismissed, and we could not get him reinstated by a local appeal to the manager, we should then take the case to the coal trade, to the owners, and invariably we have got redress there. Taken in its worst form, as Mr. Ellis was putting it, in the event of not getting redress I said we would take it——

24747. (*Mr. Smillie.*) You would appeal beyond that to the Law Courts?—Yes.

(*Mr. Smillie.*) Mr. Ellis is of opinion that you need not trouble.

24748. (*Dr. Haldane.*) Do you know any case in which the wages of firemen, taking the average of the year, are less than the ordinary wages of a man working at the face in your district?—Less?

24749. Yes.—No.

24750. That does not happen in your district?—The basis, to begin with, is larger.

24751. A man never loses money, as it were, by becoming a deputy in a mine?—No. He cannot very well lose money by becoming a deputy if he commences at a pit where they are working regularly.

24752. (*Mr. Smillie.*) Is it not the case that many hewers are earning 3s. or 4s. more than the nominal wage of the deputy?—Yes, but I am speaking of off-handed men. If he refers to piecemen, there are men who get considerably more than deputies.

(*Mr. Smillie.*) There are hewers at the face getting 10s. or 11s. a day at the present time.

24753. (*Dr. Haldane.*) It is important that a deputy should have plenty of practical experience at the face. I suppose we are all agreed about that?—Yes.

24754. Supposing a man has obtained plenty of practical experience at the face, is he not likely to lose money by becoming a deputy?—I should not say that.

24755. You would not say that he would, on the whole?—No.

24756. On the whole he has steady employment as a deputy?—He has regular employment.

24757. Which he can always rely upon?—Yes.

24758. Although he may not make so much at certain times as the man at the face, yet it is a better post?—There are some men whose qualifications as coal-getters, as piecemen, enable them while hewing coal to make considerably more than they can get by deputy work.

24759. (*Mr. Smillie.*) The real point is this. Does the wage paid to deputies at present encourage the best class of men at the coal face to leave the coal face and become deputies?—No, it does not.

24760. (*Chairman.*) You say that an average of four deputies is killed by drawing timber in the course of the year. I see in 1904 that there were as many as nine, although in 1905 there were only two. How many deputies would there be to every 1,000 men working underground in the county of Durham?—I could not say.

24761. About how many—1 in 1,000, do you suppose? How many deputies altogether are there in the county of Durham?—Slightly upwards of 2,000.

24762. That is about 1 in 50. Out of 2,000 deputies you say there is an average of deaths from falls of roof of four; that is to say, one-fifth per cent. That is 2 per 1,000 killed by this particular operation every year?—Yes.

Mr. Samuel Coulthard, called and examined.

Mr. Samuel Coulthard.

24763. (*Chairman.*) You have been requested to give evidence on behalf of the Northumberland Deputies' Mutual Aid Association?—Yes.

24764. (*Mr. Smillie.*) Are you at present a deputy in the county of Northumberland?—Until this day I think I am. It may be as well to state that I have now been appointed Permanent Secretary of the Association, and I am just beginning work this week.

24765. Up to now you have been employed as a deputy underground?—Yes, and have been for 31 years.

24766. You have had a very long experience as a deputy?—Yes.

24767. You have had experience prior to that of other classes of work underground?—Yes.

24768. It may be taken that you have a fairly good knowledge of underground work?—Yes.

24769. Is it confined entirely to Northumberland?—It is confined entirely to Northumberland.

24770 What colliery?—Seghill.

24771. You have spent 31 years as a deputy at Seghill Colliery?—Yes.

24772. Is that a fairly large colliery?—Yes, 700 or 800 men and boys.

24773. What is the depth of it?—One seam 50, another 70, and another 90 fathoms.

24774. You work three seams?—Yes.

24775. What is the method of working, longwall, stoop and room, or pillar and stall?—We have a great deal of longwall conches behind following the coal. In board and wall there are a considerable number of places where the seam is 6 feet 6 inches to 7 feet 6 inches thick, and that same seam is coming back broken, and we work out the pillars.

24776. That is because of the thickness it is not convenient to work longwall?—On account of the thickness it is difficult to work longwall.

24777. You speak, however, not for Seghill Colliery, or yourself, but for the Northumberland deputies?—I am here as the representative of the Northumberland deputies.

24778. As their general secretary you have a fairly good knowledge of the state of matters all over the county?—Yes, I am very well versed in it.

24779. As far as you know, is there any complaint as to the extent of the districts which the deputies have at the present time, or have had to look after?—Yes, we have had occasional complaints respecting the over-pressure.

24780. Of work?—Yes. We have had to deal with it on many occasions, and have had it put before the Northumberland coal owners. We think that there is a little too much exaction.

24781. May I take it that the statutory duties of the deputy as laid down by the Act of Parliament are to examine the workings under their charge in the morning, and all the roads leading to and from the workings on which persons may travel, and to look after the ventilation generally, and, if necessary, make a second examination during the day, and to generally look after the safety of the men? That is considered their statutory duty?—Yes.

24782. When you say that you have complained of over-pressure, do I take it that is because your districts have been too large to carry out your statutory duties, or duties outside of what your statutory duties were?—Perhaps it is as much outside of statutory duties, but which the law specifies for as well as the unwritten law.

24783. Your complaint generally has been that in addition to what you understood were your statutory duties, looking after the safety of the workmen as far as ventilation and timbering were concerned, other duties outside your statutory duties have been imposed upon you?—Yes.

24784. What duties?—Bringing a man away from his working face where he has to look after the men entrusted to his charge, coming out on the main road to do work at

Digitized by Google

wheels, coming outside his flat to the wheel outside. We have occasionally found that kind of thing, and found redress when we have put it before the management.

24785. Were you sometimes called upon, in the event of a train of tubs coming off the rails, to assist in putting them on ?—Oftentimes we have had to do that.

24786. In the event of a fall taking place outside your district, have you been called out, in your experience, to assist in clearing it away ?—Many a time.

24787. That, of course, was in addition to your ordinary duties ?—Yes. I consider that a case of emergency.

24788. Have you experienced, or do you know from personal knowledge, that deputies are sometimes held to some extent responsible for seeing that the material is taken out of the various sections ?—That is so.

24789. That is considered an important matter, the getting out of the material ?—A very important matter.

24790. Those are your duties, and those are the complaints that have been made. Do you consider that the deputy in a colliery, and especially in a fiery mine, is the most important person about the colliery so far as the safety of the men is concerned ?—I consider after 31 years' experience that the deputy holds a very unique position in a mine; certainly he is a most responsible person. We have gone over the special Act of Parliament and have not discovered in the duties of any other official away from the manager more "shalls" and "shall nots" than are set down to a deputy. We feel that we are considered to be very responsible indeed.

24791. In your evidence you say "That when a deputy has made repeated complaints to the management respecting his work, he, considering it too much and finds no redress, should an accident occur, the responsibility of such accident be borne by the management as the case may be." Is the responsibility for an accident of that kind not borne by the management ? Is it borne by the deputy ?—Often at inquests we have had deputies brought to task severely in connection with their duties. Our fear is that it is a growing danger to-day, and that it may come to that. When a man is brought out of his district which he controls we think that there should be some person relegated to accept this responsibility.

24792. You have made repeated complaints ?—Yes.

24793. You are of opinion according to this, and you are speaking for the deputies, that in the event of your not being able to accomplish reasonably the work designed to you, and should any dispute take place between yourself and the management, that the management should not have power to dismiss you, but that you should have an appeal to the Inspector of Mines who should arbitrate between the management and yourself as to whether you were in the right ?—Yes.

24794. Is that the general opinion of deputies ?—That is the general opinion of deputies in Northumberland.

24795. With regard to shot-firing, is that done at the present time by deputies or competent persons specially appointed ?—Until within a very recent date we had not much shot-firing by battery in Northumberland. The collier in most cases fired his own shots, but within the last 18 months they have begun to introduce the battery, and the shots are being fired with the battery by the deputy.

24796. Is it a common thing for persons outside the deputy to be appointed for that purpose ?—At a number of collieries in Northumberland the management have appointed a class of men, apart entirely from the deputies to fire shots.

24797. That is the competent person under the Act ?—Yes.

24798. In many cases the deputy is appointed as a competent person ?—Yes, and the whole responsibility of shot-firing is thrown on the deputies.

24799. You are of opinion that an additional responsibility should not be placed on the deputy ?—Yes, for this reason; we are introducing shot-firing by battery on the deputies. He is not taken from his work as specified in the General Rule, and therefore the shot-firing is an additional burden to his already laborious work.

24800. If the district in which deputies are responsible were divided into two districts, would the deputies still object to being competent persons to do shot-firing under the Act if their districts were lessened ?—I should think that would take away considerably the objection. A conscientious man feels that he has too much put on him by the introduction of shot-firing by battery.

24801. They do not object to doing shot-firing in addition to their other work provided they are able to undertake it without danger to themselves ?—Generally speaking they would consider it would be most effectually done, and with less danger, if it was relegated to a person outside of the deputy altogether, but I think it would lessen the difficulty if there were a re-arrangement of districts so that a man could assume the responsibility for the work and take less part in it, only the owner says that the deputy is the proper person to fire the shots.

24802. A deputy might have a district with ten shots a day to be fired. Would it be possible to appoint a person to fire those and have no other duties to do ?—We find that is a difficulty.

24803. You would not suggest that an employer should require a person to do that alone ?—No; economical reasons could be given why he should not.

24804. Where there is in two or three districts combined sufficient work for shot-firers you think that it would be better if it was put on a person to do that and nothing else but that ?—Decidedly so.

24805. Would that be suitable for the men at the face ?—It would be very suitable for the men at the face; that would be an important point in regard to production.

24806. Then you say: "That no person (for any cause whatever) have power to call a deputy away from the district over which he is in charge except the person in charge of the mine for the time being and then only in cases of extreme urgency; also that no deputy be employed at any other kind of work that would fix him to one position so as to prevent him having his liberty at any moment while in charge of a district however limited it may be in area or with a small number of men to follow." Are there any persons at the present time in the mines of Northumberland entitled to call a deputy away from his ordinary work to go to something else with the exception of the manager or under-manager ?—Our greatest complaint in that respect is this: outside of the district, the flat inside which we consider it our duty to attend, if a boy has tubs off he invariably sends direct for the deputy; half-a-dozen times during a shift a deputy has to be going 300 or 400 yards from the face outside of his station for the purpose of lifting on the tub. In many cases it makes it quite impossible for him to get to his men to do what he feels he ought to do ?

24807. Does that apply to Seghill ?—All over; that is more or less the practice.

24808. That is the position all over the county generally ?—Yes. In the back, it would be the back overman. We consider if he sent in for us to come out, that he is the responsible man in charge at the moment, and when he calls us away from our duties the responsibility would rest upon him, but when a boy of 15 or 16 asks us to go out because the work is stopped, we think that it is a difficult thing indeed and that we ought not to be running in and out of the district.

24809. You are bound by law at the present time to obey the orders of the under-manager or the manager ?—Yes.

24810. You are bound by law at the present time to attend to the claims of the pony-driver or anyone else who may ask you to assist in putting on a tram. What would be the result if you did not do so ?—Notice.

24811. Do you think that complaint would be make to the overman that you refused to go out ?—Yes.

24812. It might lead to your receiving notice if you did not go out to carry on that work ?—In cases it has.

24813. It has done so in cases ?—Yes.

24814. Are you quite sure of that ?—Yes, I have had to deal with cases where the management have requested men to go.

24815. Do you think that deputies should hold a certificate of competency ?—Yes, I think there should be some form of examination. I do not think that deputies, generally speaking, would object to some form of examination.

24816. Do you think that the deputies of Northumberland generally are a competent and good class of men ?—I think generally speaking they are.

24817. Do you think it might improve the class and assist the manager in selection if it was necessary and made compulsory that they should hold a certificate of competency ?—I think generally speaking that would be agreed.

Mr. Samuel Coulthard.

26 June 1907

24818. Would it be in the direction of greater safety if that were done?—Yes, the trend would be in that direction. You could have very strong men indeed who would make good deputies, and perhaps in other ways would be the means of lessening the possibility of accidents, and with very little scholastic attainment, perhaps not being able to pass an examination. A man of strong physique and strong judgment would make a good deputy apart from the mere examination.

24819. The danger would be that there might be a good man who could not pass the examination and consequently could not qualify?—I am certain of that.

24820. In the event of anything of that kind being done, the present deputies would in all probability continue their position, or get a certificate of service. There are a great many well qualified people now in the mines of Northumberland who hold first-class or second-class certificates at the working face?—Both colliers and deputies.

24821. Do you think that the deputies as a whole object to some form of examination for competency?—Some would feel that they would have to pass an out-of-the-way examination, that is to say, there is a timidity about the matter. It would not be an examination anything approaching that necessary for an inspector of a mine. I suppose it would be more in harmony with his duties; it would be a knowledge of gas and timbering, and things of that kind.

24822. Do the deputies do the timbering, or the workmen themselves?—The deputies generally do the timbering.

24823. Do the workmen at the face put up any?— If a deputy has provided the material the man is responsible.

24824. Do the deputies draw the timber?—We have created a new set of men to some extent in Northumberland. A number of collieries employ a man to draw timber apart from the deputies.

24825. In longwall workings?—Yes.

24826. And where they take it out, the pillars?—Yes.

24827. Do you think it is a dangerous employment?—Yes, it is a most hazardous occupation at times.

24828. Would you say as an experienced man that it is safe to draw timber in the longwall face or at pillars where there is the noise of men filling coals and shovelling out coals at the face?—No, it is very unsafe.

24829. In drawing timber you require to have, as near as you can get it, absolute silence?—Yes, you do.

24830. In order to know when your roof is about to come down?—Yes.

24831. It would be better you think if the timber was drawn at night, at least, between shifts, when there is no other additional noise?—Yes. The majority of deputies in Northumberland would say "Yes" to that.

24832. Have you had any accident from drawing of timber?—Yes, but speaking generally for Northumberland we have been pretty free from accidents. I believe we have a greater ratio of accidents in proportion to the men employed, but we are fairly exempt from fatal accidents to deputies. I would like to say this: One of the things that we put before our owners is that under the present circumstances deputies themselves have to draw the timber, and the Northumberland coalowners are anxious to keep it within their duties. At some collieries they employ a special man, but we think it increases the danger, because before the man commences to do the most hazardous part of his employment, he has been eight hours in the pit, and he is less physically fitted to do it.

24833. Do you mean the deputies?—Yes; that is one of the reasons we have been strongly in favour in Northumberland of there being drawers appointed to do the drawing of timber at night.

24834. A special class of man appointed?—Yes.

24835. (*Mr. F. L. Davis.*) Do the deputies draw the timber at the end of the shift?—In a number of cases in Northumberland.

24836. Just at the close of the shift?—Yes; in Northumberland there are collieries where they draw during the day. If a pit was done at five o'clock, the deputy would go to the man's place and tell him he wanted to start about three, and the pit would be done in that way. At a colliery alongside of us it is so unless it was a case of destruction of property. If he could take the timber out with safety it would be a saving and he would commence at once to draw it, but if it could stand without danger, another deputy would join him and the two would take it out.

24837. You think it is not desirable that people should work eight hours and then begin a hazardous job like that. You are strongly against that?—Yes, we are strongly against that.

24838. You said that complaints of too much work on the part of the deputies were only occasional?—Yes; I could not make a sweeping statement that it was general.

24839. In the pit where you were working was there too much work?—Sometimes. I have had reasons to complain to the management, and sometimes it has gone on a few weeks, and sometimes they have relieved us a little by taking a few men off us more or less.

24840. They have fallen in with your views?—Yes, in some instances they have.

24841. Do you suggest that the Mines Inspector should be the arbitrator between the management and the deputy?—Yes.

24842. In short, cases of too much work, or anything of that kind, do you think the Inspector would like to have that responsibility put upon him?—We have weighed this matter and considered it carefully as a joint committee. Going back five or six months, we considered in Northumberland that the owners were too exacting, and we gave considerable evidence to them, and there were a number of reasons why we thought they should relax, and we have asked for arbitration both as to the wages and responsibility; but they have refused arbitration, and we felt a little grieved.

24843. The owners have refused arbitration?—Yes, they have refused arbitration. We think the Government Inspector would be the best person to appeal to when it is a question of whether the deputies under the Act have a knowledge of the duty assigned to them, and where he feels he cannot carry it out with satisfaction to himself, feeling satisfied that he is doing his level best to lessen accidents with the men employed.

24844. Have you thought how it would work out? Supposing the Inspector took your view that you were right and the manager was to continue employing you, with lessened duties, we will say. Or supposing the manager said somebody was not a capable man and the Inspector said he was, and an accident happened, do you think that the manager ought to be relieved from his responsibility?—That would be a matter for consideration, I should say.

24845. He has no voice in it; he is over-ruled by the Inspector, and he has to keep the deputy on whom he does not think is capable, and an accident happens. In such a case as that is he to be relieved from responsibility?—It may be a side of the question we have not looked at, but we think that the evidence of the deputy and the evidence of the Inspector ought to be considered and to be set against the evidence of the manager in a case of that kind, but I agree that it is a very difficult point.

24846. You can conceive difficulties might arise?—Yes. We have had accidents even with the most skilled men where it would be on the part of the manager himself an outrage on commonsense and reason to say that he was incapable.

24847. I quite understand that?—I see the force of your position. In that case it would place the Government Inspector in a very difficult position.

24848. It would put the whole responsibility on him?—Yes, it would, to determine it, but he would have the evidence of the deputy on one side, and he would practically stand as an arbitrator between them, and that would be very strong evidence that the management was at fault.

24849. (*Mr. Ratcliffe Ellis.*) In cases where you have been overworked yourself in your district you have applied to the management for assistance of some kind, and you have got it?—In many cases I have.

24850. The time you are invited to go on the road, was in cases of emergency, you say?—Yes.

24851. A fall of a roof?—Blocking the way.

24852. That would always happen?—That does occur more or less. That is in relation to having to go out at the call of boys and leaving our duties. That is a ground of complaint, and has been more or less. In some instances we have got consideration from the management, and they have stopped it.

Digitized by Google

Mr. Samuel Coulthard.
26 June 1907.

24853. That amounts to this: it is supposed to be a part of your duty to see that the traffic arrangements in the road are kept clear?—Yes.

24854. A message comes to you at the face to say that there is a block in the road?—Yes.

24855. You are required to go out and see that it is removed. That takes you from your proper duties of inspection at the face. You think that you should be relieved from that duty?—Yes.

24856. And that your duty should be confined to the proper duty of inspection?—Yes, unless it is a case of extreme urgency.

24857. You consider that your duties are too great at the present time and too numerous?—Yes.

24858. Do you think that the safety of the men would be better secured if the deputies had less to do? That is what it all means, does it not?—Yes, it is a question of pressure.

24859. You would be prepared to do all the duties you have to do now if you had the time to do them?—We are quite prepared to do them. Take myself, after 31 years, more or less, and the son of an overman who had 35 years' experience, I think I have at least a fair knowledge, and I have read my rules, and the question of safety has been a very important item with me. You have to apply to the overman that you have too much work to do, and sometimes they are not ready to give you redress.

24860. There is no other person in the mine, official or workman, except the deputy, perhaps, to be put in the position to have a right to appeal to the Government inspector against the decision of the management?—No.

24861. Do you think that the deputy should be put in that exceptional position?—I think as deputies that we should have a court of appeal.

24862. You would not extend that right to any other persons employed in the mine?—No. We stand in rather a peculiar position. We have the men on one side and the masters on the other, so that we stand really between. Our duty is to protect life and limb, and that is on one side, and on the other side it is our duty more or less to protect property for the management, so that we stand in a very peculiar position.

24863. The duty of a deputy is so exceptional that you think he ought to be treated exceptionally in that way?—Yes, we think so.

THIRTY-SIXTH DAY.

Thursday, 27th June, 1907.

PRESENT:

Lord MONKSWELL (*Chairman*).

WM. ABRAHAM, Esq., M.P. (Rhondda).
F. L. DAVIS, Esq.
ENOCH EDWARDS, Esq, M.P.
THOMAS RATCLIFFE ELLIS, Esq.
JOHN SCOTT HALDANE, Esq., F.R.S.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. JOSEPH ENGLISH, called and examined.

Mr. Joseph English.
27 June 1907

24864. (*Chairman.*) I understand you appear here on behalf of the Northumberland Miners' Mutual Confident Association?—Yes.

24865. How many members are there in that association?—26,000, nearly.

24866. Out of a total of the Northumberland miners, of how many—about?—There would be about 33,000 engaged in the mines.

24867. The greater number then of the Northumberland miners belong to this association?—Yes.

24868. What is the object of your association?—A general trades union to look after the safety and protection of the members of the association.

24869. What do you mean by "Mutual Confident Association"?—We combine in a mutual confident association to protect each other, the same as in ordinary trades unions.

24870. You have in your association the very great majority of the Northumberland miners?—Yes.

24871. May we take it that what you tell us to-day is what you have been deputed to say, to a great extent at all events, by your association?—Yes, I am the president of the association, and compensation agent.

24872. I suppose you have had meetings, and you have put before the association what you propose to say, or the gist of it, and therefore you can confidently say that they are of your opinion?—It is not necessary to put it before our members; but they frequently have deputations to the managers in order to try, if possible, to get similar suggestions carried out.

24873-4. You can say from your own personal knowledge that the suggestions you are about to make are suggestions that commend themselves, at all events, to the great majority of the members of your association?—Yes.

24875. I understand you would like to begin with the General Rules you wish to be amended and take them in their order?—Yes, if you would like me to adopt that course of procedure.

24876. I think you would like to begin with General Rule 1, par. 2?—Yes. The Rule at present is: "The quantity of air in the respective splits to be under the control of a certificated manager." We wish it to be altered to read thus: "The quantity of air in the respective splits to be under the control of the official in charge of the split." At the present time it is no one's special duty to see to an adequate supply of air; and our idea is that instead of it only being under the responsibility of the general manager it ought to be the duty of the official in that part of the mine to measure the air.

24877-8. By the "official" in any particular part of the mine, I suppose you mean, for instance, the fireman?—The fore overman, and in the absence of the fore overman would be the back overman.

24879. You want to add on to the second part of General Rule 1 a provision that each split should be separately looked after, either by the fireman or some other competent person?—Either the fireman or the official in charge.

24880. You say some official, at all events, should be deputed to look after each separate split?—Yes; as it stands at present there is no one responsible for the doing of that work.

Digitized by Google

Mr. Joseph English.

27 June 1907

24881. You would like that to be added on to the General Rule?—Yes.

24882. You wish to say something on General Rule 4? We work the double shift system, and the inspection takes place in the morning. There are two continuous shifts, the fore shift and back shift, working on an average 7¼ hours each. A place may be inspected in the morning, but if the fore shift man is absent, the place stands 7¼ hours: it is not re-examined, and the back shift man goes in without that place being examined.

24883. If there are two shifts is it not examined for each shift?—If the fore shift is off work there is no more inspection takes place, the back shift man goes in, and where there is gas it many accumulate in the interval.

24884. (*Mr. F. L. Davis.*) How do you mean, if the man is off work? Surely someone must inspect?—The place is examined in the morning, according to this rule, two hours before the workmen enter, but if the fore shift workman does not come out that day, the fireman is not bound to make a second inspection before the back shift man goes in, because it is looked upon as a continuous shift.

24885. He always examines for the first shift?—Yes, but not for the second shift.

24886. Never?—No. A continuous shift means one shift, according to the provisions of this Act.

24887. (*Chairman.*) And you object to that?—Yes.

24888. Is there any other Rule you wish to give evidence about?—The next one is Rule 9 with regard to safety lamps. We think that there ought to be some test with these safety lamps in order to prevent men running risk of getting into stythe which is very injurious to health. By the latest inventions with respect to safety lamps men can work in foul air with these lamps where it is not fit for them to work. I know a case where one man got in with a lamp and he had to crawl out as the air was not fit for a human being to be in. At the present time, with the new safety lamps, it is quite possible for a man to get in without his lamp going out where it is not possible for him to live for any length of time.

24889. Then you think there has been retrogression in the matter of safety lamps, and that the last type of safety lamp is not so safe as the former type?—They are perfectly safe, so far as an explosion is concerned, but with them they can get a man into a place where it is not fit for a man to work.

24890. Then it is not a question entirely of the type of safety lamp?—No.

24891. You merely say that the safety lamp is sometimes in the nature of a trap?—That is so.

24892. People think they are perfectly safe with a safety lamp when they go into a place where they ought not to go into, and where they ought not to work?—Yes.

24893. How would you prevent that?—By having a sort of test with regard to the lamp, to see whether it would be fit for a man to live in a place where these lamps will burn. The Park Lane lamps are all right; but there is a new invention which burns with paraffin oil and a double burner, which is a very good lamp, although I do not know the name of it.

24894. You think that shows gas much more easily than the other lamps?—It detects gas more easily, but it will burn when it is not fit for a man to be in there. My idea is that there ought to be some test with regard to these lamps.

24895. (*Mr. Enoch Edwards.*) Do you mean that the air is foul?—The air is foul and yet the lamp may still burn. There is a disposition to get the places worked, and consequently these lamps are invented. Of course, they are perfectly safe so far as an explosion is concerned; yet it is dangerous to health to work in such places. The consequence is, the men's health suffers a good deal from stythe.

24896. (*Mr. Ratcliffe Ellis.*) What you mean, I think, is that there is no gas to do any harm, but the air is so foul it is not fit for the men to work in it?—Yes, no explosive gas.

24897. Because the lamp does not detect the gas he can work there without knowing it is unsafe?—Yes.

24898. It is perfectly safe, so far as gas is concerned, but the air is not fit for the men to work in?—That is so.

24899. (*Chairman.*) There is a false sense of security, because by the safety lamp sometimes, although the ventilation may be injurious to health, a man may work in it without being aware of that fact?—Yes; it may ensure safety from explosion, but it is injurious to health at the same time.

24900. How would you get over the difficulty?—These lamps should be inspected, and if they render it possible for a man to get in where he ought not to work, then, I think they should be condemned.

24901. (*Mr. Ratcliffe Ellis.*) You want the lamp to indicate not only gas, but foul air, where a man should not work?—Yes.

24902. (*Mr. Wm. Abraham.*) I take it you would stop the use of a lamp that lives in an air which a man ought not to go into?—Yes. I think there ought to be something done in that direction, because the men are injured very much and suffer in their health in consequence.

24903. (*Mr. Enoch Edwards.*) Do you suggest that with another lamp this atmosphere would put the light out?—Yes; the Park Lane lamp would not burn where these would burn.

24904. (*Chairman.*) There are certain lamps which will go out when the atmosphere is foul?—Yes.

24905. You know of those lamps?—Yes.

24906. You think the rule which you suggest should be made compulsory?—Yes.

24907. (*Mr. Smillie.*) Improvements in lamps enable them to work in places where previously a lamp would not burn; consequently, although the lamp burns and shows a good light, the men are being poisoned?—That is it.

24908. (*Chairman.*) You say the later lamps do not give the same indication of an impure atmosphere that some of the other safety lamps used to do?—The point I wish to bring forward is that these lamps can burn in foul air although they may not indicate gas.

24909. That you have said several times, and I quite understand it; but I thought you also said there was a type of lamp you knew of that would show foul air as well as gas?—It would not burn, and so it would indicate the presence of stythe.

24910. It would show foul air as well as gas in some way?—Yes.

24911. You say you know of such a lamp, and the use of that lamp ought to be made compulsory?—Yes.

24912. (*Mr. Wm. Abraham.*) In your opinion that lamp is safer than the newer kinds of safety lamp?—Yes, so far as the health of the men is concerned.

24913. (*Chairman.*) You say that some of these new safety lamps, so far as the health of the miners is concerned, are not so satisfactory as lamps you know of which were used before?—That is so.

24914. What lamps would you prefer?—The Park Lane lamp is a very useful lamp for that purpose.

24915. You suggest that would be a good lamp?—Yes.

24916. Rule 9 would hardly deal with questions of that kind, would it?—I think it would.

24917. That rule is: "Wherever safety lamps are used, they shall be so constructed that they may be safely carried against the air current ordinarily prevailing in that part of the mine in which the lamps are for the time being in use, even though such current should be inflammable." That only deals with gas, and not with foul air. I understand, whether you think the General Rule could be altered or not, at all events you are of opinion that a certain type of lamp ought to be used instead of the type of lamp at present in use; and you have an opinion as to the kind of lamp you would like to see used?—Yes.

24918. What is the next rule you want to call our attention to?—Rule 22, as to timbering. This is very unsatisfactory in our district, and, I think, it is the general complaint right through other districts. The present rule says: "Where the timbering of the working places is done by the workmen employed therein." I need not read any more than that. What we want to insert there is "Where the timbering of the working places is done by the workmen employed therein *in the absence of the deputy.*" Our reason for that is that the deputy many times goes into the places, and he considers he has no right to do it. According to the Act the workman is responsible for setting his own timber, and the deputy simply walks out of the place without setting any timber. According to the Act he is not compelled to do so, and, therefore, we wish those words inserted.

24919. Making it necessary that it shall be the duty of the deputy to see that proper timbering is done?—It shall be the duty of the deputy to properly secure the place, and in his absence the workmen to be responsible for the timbering of the place.

Digitized by Google

24920. You say it should be the duty of the deputy to do this, and he is to be made responsible for it by Act of Parliament ?—Yes.

24921. (*Mr. F. L. Davis.*) This rule applies to the whole of the coal trade. We do not know what "deputies" are in our part of the world, where we have a different custom altogether. The men do not have anyone to do the timbering for them, so that if you put it in this rule we shall get thoroughly mixed up ?—I follow that.

24922. (*Chairman.*) Do you mean that now the deputies contend they are not responsible for putting up the timber, but that it is the duty of the workmen ?—Yes.

24923. I thought the deputies were responsible in Northumberland for putting up the timber ?—But the present Act does not make them responsible.

24924. It does not make them unresponsible if they undertake the duty. Surely if they undertake the duty they are responsible ?—The whole of the responsibility, according to the present Rule, falls on the workmen. There is nothing in there to put the responsibility on the deputy.

24925. (*Mr. Ratcliffe Ellis.*) In Northumberland ?—Yes, even in Northumberland.

24926. Special Rule 46 does not conflict with anything in the Act of Parliament, and it is perfectly binding: "Each deputy shall be responsible for having ready and putting into or near to every working place under his charge a sufficient quantity of suitable timber," and they shall report any deficiency ?—Yes, that is placing the timber in a position where it can be got by workmen.

24927. "and (except as provided in Rule 92) for setting sufficient timber to afford the greatest possible safety to the workmen employed." If there is a rule to say the deputy is responsible, surely he is responsible ?—There is nothing in the Act of Parliament that I can see to contravene that —the term "deputy" is not in the Act of Parliament. We want it inserted in the Act that the deputy is responsible.

24928. (*Mr. Ratcliffe Ellis.*) General Rule 21 is: "The roof and sides of every travelling road and working place shall be made secure." Rule 22 says: "Where the timbering of the working places is done by the workmen employed therein, suitable timber shall be provided at the working place." In Northumberland the Special Rule says that the deputy is to do the same thing ?—We want to put in the words "by the workmen in the absence of the deputy."

24929. (*Mr. Wm. Abraham.*) It is a different system altogether, and they want the deputy to be made responsible in the general Act ?—If you look at the Special Rules you will see they may apply to some particular colliery.

24930. (*Mr. Ratcliffe Ellis.*) Those Special Rules apply all over Northumberland ?—No; different collieries have different Special Rules.

24931. Do I understand that Special Rule 46 is what you want in the Act ?—Yes.

24932. Supposing it was made general, it would meet your wishes ?—Yes.

24933. (*Mr. Smillie.*) It would be as well to look at the rules. Rule 46 is: "Each deputy shall be responsible for having ready and putting into or near to every working place under his charge a sufficient quantity of suitable timber, brattice, sprags, and other materials; and (except as provided in Rule 92) for setting sufficient timber to afford the greatest possible safety to the workmen employed, and he shall report any deficiency of timber, brattice, sprags or other materials, to the overman or back overman." Then Rule 92 is: "Should the working place of any man or boy become unsafe, from any cause, he shall discontinue working in it, and immediately send or go for the deputy; but if unsafe from want of timber being set, then, in the absence of the deputy, there being sufficient timber of proper lengths in or near to the place, he shall set it, in order to keep himself safe, or shall cease to work and retire therefrom, and report the same to the deputy or other official; and in all cases where necessary, he shall sprag his jud." You want that to be of general application ?—Yes. In Northumberland—and I take it the same thing applies to other counties—each colliery has Special Rules, and the consequence is that there is no one responsible for the timbering. They place the whole of the responsibility upon the workmen, and we want that responsibility removed from the workmen.

24934. (*Chairman.*) Do you want to say anything more about that rule ?—I think that is all.

24935. What is the next rule you want to give evidence upon ?—The next rule I want to speak about is No. 34. "Where persons are employed underground, ambulances or stretchers, with splints and bandages, shall be kept at the mine ready for immediate use in case of accident." We wish that to be amended, and to read that they should be kept at the face or at the deputy's chest. R 34

24936. Where they would be more handy ?—Yes. The working place may be a mile and a half or two miles in, and the injured persons have to be brought to bank before they are able to obtain relief by the use of splints or stretchers, carbolic oil, or anything of that sort. A man may almost bleed to death before he gets to bank.

24937. Have you any form of words which you wish to be inserted in the rule in order to carry that out ?—That stretchers, splints, bandages, carbolic oil, &c., should be placed in and be kept in the deputy's chest. ✓

24938. In every deputy's chest ?—Yes. It is done in many mines now. I also think that a deputy should pass the First Aid examination, and have a First Aid ambulance certificate. ✓

24939. Have you anything else you wish to say in respect to that rule ?—No.

24940. Have you anything to say in respect to Rule 38 as to the inspection by workmen ?—Yes. At the present time the workmen may appoint two of their number, accompanied by an official, if the manager thinks fit to inspect the mine. This inspection periodically by the workmen, I think, is one of the best means of preventing accidents we possibly can have; but it is left entirely to the option of the manager whether he will allow any of the officials to accompany the workmen. We contend that there ought to be one of the officials specially provided for by the Act to accompany the workmen's inspectors when they are inspecting the mine. R 38 ✓

24941. Have you known cases where the workmen's inspectors have gone over a mine and have not been able to get an official of the mine to go with them ?—I do not think I could mention such a case, but there is that option on the part of the management.

24942. You think that ought to be done away with ?——Yes.

24943. That the management should be obliged to provide some sort of official to go round with the men ?—Yes.

24944. Would you say it should be either the manager or sub-manager ?—One of the officials.

24945. Is that the only suggestion you have to make as to Rule 38 ?—Yes.

24946. Have you anything to say as to Rule 39 ?—Yes. At the present time a man is not allowed to work alone as a coal or ironstone getter unless he has been two years in or about the face. The man who has just commenced in the pit can go into the face and do any other work, but he cannot be a coal or ironstone getter. However, it frequently happens that he may be set to timbering work by himself, and we have had various accidents occur to men who have been inexperienced going to work in these places by themselves. We think no one should be left to work by himself unless he has been two years in and about the face. R 39 ✓

24947. You think it should not be restricted to coal getting; but he should not be allowed to work at the face, or anywhere ? Do you mean that ?—In the face.

24948. That is, he should not be allowed to put up timber, or do anything at the face ?—That is right. ✓

24949. Should he not attend to loading the trams, or anything of that sort ?—Yes, of course we make that exception—that is, the hauliers.

24950. (*Mr. Ratcliffe Ellis.*) Do you apply it to hewers and say that no hewer should be employed at the face unless under those circumstances ?—It applies to hewers now, but we want it extended.

24951. To what other men ?—Shifters, wastemen, and stonemen, and any other class of man who has to work in the face. ✓

24952. Independent of the hewer ?—Some have to take down stone, renew timber, &c.

24953. Do you say he should not be employed at all unless he has been engaged in that particular work for a year. ?—Not alone—that he should be accompanied by some other workman until he becomes experienced.

24954. One man in the gang should always have that experience ?—One man working with them.

Digitized by Google

Mr. Joseph English.

27 June 1907

24955. If there was one man of experience would you limit the number of the gang?—Provided he had someone with him who had the experience.

24956. (*Chairman.*) Would you be inclined to limit the number of unskilled workmen who might work under the supervision of a skilled workman, or would you allow 10 or 12 unskilled men at the face to work under the supervision of only one skilled man?—I do not think I would.

24957. How many would you say? Would you say two, or not more than one, ought to work under the supervision of a skilled man?—The present Act has worked very well with regard to the coal-getter, and I do not see why it should not work very well with regard to the other class of men, if applied to them.

24958. You could not have more than two or three men at work at the face at the kind of work to which you refer?—No.

24959. (*Mr. Enoch Edwards.*) You could not have 10 or 12 men working at the goaf, for instance?—No.

24960. (*Mr. Wm. Abraham.*) Your point is, as I understand it, that no unskilled man should be allowed to work alone at anything?—Yes.

24961. (*Chairman.*) That is to say, every unskilled man must be under the immediate supervision, within a very few yards of a competent workman?—Yes.

24962. So that that would in itself limit the numbers?—Yes.

24963. Would that be a sufficient limitation to the numbers, or would you be inclined to add that not more than three or four unskilled workmen should work unless under the supervision of a skilled workman?—I do not think it is necessary to specify any numbers.

24964. Is there anything else you want to mention with regard to that?—Not with regard to that part, but I have something to say with regard to coal-cutting by machinery. Machines for coal cutting are being largely introduced now into the North of England. Mr. Straker and I happened to be appointed on a committee to make special inspections and enquiries with regard to the working of these coal-cutting machines, and we found that the sparks emanating from these electric machines would be very dangerous where there is gas to be found. Where the electric coal-cutting machines give sparks they ought to be condemned.

24965. (*Chairman.*) Have you anything to say about the increasing danger from coal dust owing to the use of machinery? It has been put before us that some coal-cutting machines produce finer and more explosive dust, and in greater quantities than the ordinary method?—The Northumberland coal does not give off much dust; it is not of a gassy nature, and it is hard, and therefore there is not so much dust from it. I do not know what they do in other districts. With regard to these machines working, there is a suggestion we have which ought to be attended to, I think. When they are continuously working the machines it is impossible for the men with them to pay sufficient attention to the stone and the nature of the strata, because there is such a terrible noise coming from these machines. A man cannot hear if the stone is "working," and I think that they ought to be stopped two minutes in every quarter of an hour in order that the men working at the machines might examine the roof.

24966. You would have a rule laid down to that effect?—Yes, to have them stopped, in order that the men may have sufficient time to examine the roof and keep themselves safe.

24967. Do falls of roof and side occur very often?—We have had various accidents since the machines were introduced. There is not much fear of the sides: it is the roof.

24968. You consider from your experience that falls of roof are more frequent if coal-cutting machinery is introduced?—Yes, but there could be that prevention.

24969. With that prevention you think it might be safely done?—Yes.

24970. To what extent are coal-cutting machines used in your county?—I think we have 25 or 30 machines in Northumberland now.

24971. Altogether, do you mean?—Yes.

24972. Or do you mean the mines with which you are acquainted?—Yes.

24973. Which do you mean, in the whole of the county, or the mines with which you are acquainted?—In Northumberland.

24974. About 25 machines?—Twenty-five or 30.

24975. (*Mr. F. L. Davis.*) That is a very small number? But a few years ago we had none.

24976. (*Mr. Wm. Abraham.*) Perhaps a description of these things would enlighten us on the matter. Will you kindly describe to us how these machines are fastened in order to put them to work at the face?—They are not fast: they run along the face, and we had an accident just a few months ago, where a man was killed, and there was no one near. They could not hear him through the machine continuously working.

24976A. (*Mr. Ratcliffe Ellis.*) The noise caused by the machine prevented his being heard?—Yes.

24977. (*Chairman.*) You say that with the use of 25 machines in Northumberland the number of accidents has considerably increased?—Yes, and they may extend. The company I worked for just previously—I have just been appointed president of the Northumberland Miners—10 years ago did not know what a machine was. Now they have about six, and they are making preparations to have more.

24978. Have you had an extensive experience quite lately? Have you worked underground at all quite lately yourself?—About three months ago I ceased.

24979. Have you worked in many mines in Northumberland?—I have worked in two. I have worked about 30 years or 35 years, but I have only been in two mines.

24980. You have seen these coal cutting machines in use yourself?—Yes, on the Committee of Enquiry we saw the whole of them in Northumberland working.

24981. (*Mr. Enoch Edwards.*) They are working thin seams?—Yes: there are some you could not work unless it was by a machine.

24982-3. (*Chairman.*) It seems on the whole that falls of roof and sides at the working face have gone down in the Newcastle district?—Accidents in the Newcastle district, according to the returns, have increased slightly during the last 12 months.

24984. The death rates from accidents through falls of ground at the working face for every 10,000 persons employed underground were .47 in 1901, in 1902 .32, in 1903 .39, in 1904 .46, and in 1905 .40, so that 1901 was the worst year. The average of the last five years is .41, and the average of the five years before is .50?—We get a pretty fair idea from our Association returns of the number of accidents caused. I think it is a better gauge than that.

24985. (*Mr. Enoch Edwards.*) You cover all men employed in the pit, and you pay for all accidents?—Yes.

24986. (*Mr. Ratcliffe Ellis.*) Have you mentioned all the points in which you wish amendments to either the Act of Parliament or the General Rules?—No; there are others, if I am not detaining you too much. There is a point with regard to the back shafts. There are two shafts to every mine. We wish to have the back shafts fitted up with proper appliances and winding gear to be used in the case of accidents. At the present time they have only the one shaft fitted up so that they can draw men, and should an accident occur in that particular shaft the men have to remain down in the mine or travel to an adjoining pit, if there is one. We have had one where the men had to travel almost two miles underground to get to another shaft belonging to the same company. If we had the back shaft fitted with winding gear we could have drawn up the men there.

24987. (*Chairman.*) You must have always two means of exit from a mine close to one another. In this back shaft there ought to be appliances for getting the men up speedily. That is what you think?—Yes. It would not entail a great deal of cost, and it would be there in readiness.

24988. (*Dr. Haldane.*) Is there any means at all of getting up these back shafts?—None whatever, only the return airway. They are bound to have two shafts in our mines, upcast and downcast, and there is no machinery whatever in the back shaft.

28989. (*Mr. Enoch Edwards.*) Is that general throughout Northumberland?—Yes.

24990. The back shaft is the upcast?—Yes.

24991. (*Chairman.*) In the Coal Mines Regulation Act section 16, sub-section 1, paragraph (a) it is provided that "There must be at least two shafts or outlets, with which every seam for the time being at work in the mine shall have a communication, so that such shafts or outlets shall afford separate means of ingress and egress available to the persons employed in every such seam, whether the shafts

Digitized by Google

or outlets belong to the same mine or to more than one mine." Then paragraph (c) says; "Proper apparatus for raising and lowering persons at each such shaft or outlet shall be kept on the works belonging to the mine: and such apparatus if not in actual use at the shafts or outlets shall be continually available or use." Is that so?—No, it is not done. Would you read that again—"such apparatus to be kept—"

24992. "Proper apparatus for raising and lowering persons at each such shaft or outlet shall be kept on the works belonging to the mine." "Each," that is to both back shaft as well as the other shaft?—It is not done.

24993. (*Mr. Ratcliffe Ellis.*) How do you carry out that Rule at your own colliery?—I have never seen any apparatus yet. At some places they may have a gin rope where they draw one man at a time.

24994. (*Chairman.*) Have you ever called the attention of the Mines Inspector to the want of proper apparatus for raising and lowering men in these back shafts?—We have not. It is a very difficult matter, and if we can manage without going to the Government Inspector we do: we never care about going to the Government Inspector if we can possibly avoid it.

24995-6. If you have these back shafts without any apparatus for raising or lowering the men, that seems to me to be an infringement of the Act?—Taking the Act as it is worded, it is so vague that even if they had a "jack-roll" there to be in readiness, that would bring them within the Act. They may have a horse or a crab or something like that.

24997. It seems to me that the spirit of the Act of Parliament is at all events infringed?—That is not an uncommon thing

24998. It seems to me that there is a good case for seeing that the provisions of the law are complied with at the present time?—I am for making the provisions more clear.

24999. (*Mr. F. L. Davis.*) Do they never raise the coal from the upcast shaft?—Very seldom.

25000. (*Chairman.*) It is a pity when you find that the spirit of an act of Parliament is not being carried into effect properly that you should not mention these things to the Government Inspector. Why should you object?—Our idea is to have them so worded in an Act of Parliament that they cannot possibly get out of them.

25001-3. I should have thought that it was a clear infringement of the Act, and that if you went to the inspector and the inspector went to the Home Office it would be put right. It seems clear to me that according to the spirit of the Act the mineowner is under the obligation to furnish special apparatus for raising and lowering the men?—Yes.

25004. Is there anything else you wish to say?—I want to say something about the winding engine-men. We wish that this particular class of labour should go through a medical examination at least once in six months. There was a case where the poor fellow only had time and the presence of mind before he dropped to shut the steam off and avoid an accident. Where there are so many lives under the charge of an engine-man, we think that he ought to be medically examined once in six months, to see if he is fit for those duties.

25005. It is also suggested in some quarters that he ought to have a certificate of competency. Have you anything to say with regard to that?—I do not know that I can say anything so far as the engine-man is concerned, but he certainly ought to be medically examined after he is there.

25006. Is there anything else that you wish to say?—I wish to say something with regard to the travelling ways down the mine. We had an accident twelve months ago where there was no travelling way, only the refuge holes, and we considered that there ought to be travelling ways by the side of the haulage road. There is no difficulty, and if that were done many accidents would be avoided.

25007. Travelling ways when they are made should be kept clear throughout the whole length?—Yes.

25008. On one side?—Yes, they do that at some of the pits, but there are some where they have not these ways.

25009. It has been suggested to us where you have mechanical haulage and two trams may pass one another on the same haulage road, that instead of having a gangway at the side, you ought to have a gangway in the middle sufficiently wide to make it safe for a man to stand in the middle while those two sets of trams go by?—I do not think that would be very convenient or even practicable If I had a suggestion to make, I think there ought to be a way entirely from the haulage road to the travelling roads, but there is no difficulty to make one alongside of the haulage road. That could be easily done and would avoid many accidents.

25010. (*Dr. Haldane.*) What is your objection to a travelling way in the middle between the rails?—I think it would be more dangerous than by the side. If by the side, it could be fenced off, but in the middle that could not be done. In the middle you have two sets to contend with; on either side you have only one.

25011. (*Mr. Smillie.*) Supposing a person has a full train of trams to go out and he is standing on the inside of the rails, between the two sets of rails, and a train of empty trams comes in, he has no room to get between?—No; if at the side it would be better. There is frequently a protection by fencing for these men who have the trams to attend to: they are generally protected by fences.

25012. It is common to have a sufficient width between two rails at a pass-by so that a person could stand between?—Yes, so far as a pass-by is concerned.

25013. (*Chairman.*) You would not have it throughout the whole length of the haulage road?—Right from the shaft to the face.

25014. (*Mr. Smillie.*) The travelling road along the side?—Yes.

25015. (*Chairman.*) Not along the middle, except at certain points possibly?—Yes. There is another question which men think very much about in Northumberland, and that is, with regard to detaching hooks and safety catches on cages.

25016. Before we leave the haulage roads, are you in favour of trailers or something to stop the trams, supposing they should get detached and run away?—I do not think you need make provision for that on the haulage roads.

25017. You have stops of various kinds, stops and catches to prevent runaway trams doing damage?—They have switches the same as on the railways which stop the trams for the men.

25018. You are satisfied with what is done with regard to that?—Yes.

25019. You want to say something about cages?—The detaching hooks and the safety catches we think are very important. That is for overwinding and breakage of ropes, to hinder the cage going back into the pit. They have been largely introduced in Northumberland and there is a Special Rule on that point, No. 26: "If in any mine the winding apparatus is not provided with some automatic contrivance to prevent overwinding, then the cage, when men are being raised, shall not be wound up at a speed exceeding three miles an hour, after the cage has reached a point in the shaft to be fixed by the Special Rules."

25020. If overwinding is absolutely prevented you need not have these detaching hooks, because they only come into operation if it takes place?—It is the detaching hooks that prevent overwinding. As soon as the cage goes up the rope leaves the cage hanging.

25021. I understand that there are contrivances which some people think better than these detaching hooks, which prevent the cage going up a certain distance?—So much the better if you only make it compulsory.

25022. (*Mr. F. L. Davis.*) Do you mean safety catches in the middle of the pit?—Anywhere in the shaft.

25023. If the rope breaks?—Yes.

25024-5. (*Dr. Haldane.*) Are there usually wooden guides in Northumberland?—Yes. With regard to timbering we wish, whether the place is safe or unsafe, that timbering should be only a certain distance from the face, and not above 4 ft. Most of the accidents that occur are through places being considered safe by the men because they neglect to put the timber in. There should be a uniform distance. Of course each county has different Special Rules, and some have one distance and some another, but we think in Northumberland that if there were a specified distance that in all probability a lot of accidents that are caused could be avoided by that special distance being uniform.

25026. Would you have a system of timbering outside the faces along the roads?—I could not suggest anything there, but in the face there should be some provision made that it should not be more than 4ft. from the face.

25027. A maximum of 4 ft.?—Yes.

Digitized by Google

Mr. Joseph English.

27 June 1907

25028. Is there anything else that you wish to say?—No.

25029. (*Mr. F. L. Davis.*) Is that the supply of timber? No, the timber put up. There is another point, the running planks in the face. They have a system in France where there is a running plank driven in to the top of the coal, and when the coal is worked it protects the stone. In a hard seam, when a big shot has been put in, the shot shatters the stone, and, as soon as the coal gets out, down comes the stone. Various accidents are caused in that way. In France they have a steel bar six feet in length on each side of the barrow-way, and the end notched into the coal. I think that is very necessary.

25030. (*Mr. Ratcliffe Ellis.*) With regard to the second paragraph of General Rule 1, that requires "In the case of mines required by this Act to be under the control of a certificated manager, the quantity of air in the respective splits or currents shall at least once in every month"?—Yes.

25031. Do you think that is often enough?—Yes, providing it is properly attended to.

25032. The only alteration you suggest is, that it should specify who is to make the measurement?—Yes, and who is to be responsible for the measurement.

25033. The certificated manager is responsible?—Yes, but we consider that he ought not to be responsible, but that the overman, or the official in charge, should be responsible.

25034. Do you really mean that you would relieve him from responsibility in this important matter, and depute it to an overman?—Do you mean to relieve the general certificated manager from his responsibility and place it upon the overman?—You could not relieve the general manager of the general responsibility of the mine, but I am afraid that there is too much put on the general manager and not sufficient on the under-managers.

25035. Would you relieve him or make both of them responsible?—I would make both of them responsible.

25036-8. Who is the man you would make primarily responsible for this duty?—The overman in the mine every day. It ought to be his duty to make the measurement.

25039. You say the overman ought to be primarily responsible for the examination and the measurement of the air?—Yes.

25040. As it is now, it is under the control of the certificated manager?—Yes.

25041. He can do it himself or appoint anybody else to do it. Would you prevent him having that right, and say that the only man entitled to do this should be the overman?—The back overman or the fore overman.

25042. He is a less responsible man than the under-manager?—Yes.

25043. Is your idea that no other person shall be appointed by the certificated manager to do this except this overman?—Yes.

25044. Do you think that would be right?—I think so. I think the responsibility ought to come on the overman.

25045. You would make this man examine it and no one else?—With the under-manager of course. You should make both parties responsible.

25046. There are two men to be made responsible, the overman and the under-manager?—Yes.

25047. The certificated manager could do not it himself, if he wished?—How do you mean?

25048. You say this is the person to be appointed to make this measurement and nobody else?—To be responsible for the measurement—to be responsible for the quantity of air.

25049. Is he to measure it himself?—Not necessarily.

25050. The certificated manager is responsible. You want to make somebody else responsible as well as the certificated manager. Is it the man who is to measure it whom you want to make the responsible man?—The back overman is in the pit in the b ck shaft. The possibility is that the under-manager is not in the pit at all.

25051. Is it the overman you propose to say must be the person to make the measurement?—Yes.

25052. And he alone?—Yes.

25053. Do you think that that is an arrangement conducive to safety?—Yes, I think it is a better arrangement than the present one.

25054. (*Mr. Enoch Edwards.*) Does he do it now at all?—No. The certificated manager can depute his work to the overman. The overman may do it, but he is not obliged to do it.

25055. (*Dr. Haldane.*) I think in your evidence it was not the actual measuring of the air that you wanted the overman to do, but to have control over the regulators so as to be able to alter the air regulators if there was not enough air?—Yes, if there was not enough in one district he could take it from one district and put it into another. We want the overman to be entirely responsible for the airing of the mine.

25056. (*Mr. Ratcliffe Ellis.*) Do you think it would be safe to allow an overman to regulate the air as he thought fit, independent of the manager?—I do. I think the manager in many cases is very seldom where he ought to be.

25057. We agree that ventilation is the most important part in connection with the management of the mine. Do you agree that it is the most important consideration for the safety of the men that the ventilation should be properly conducted and adequate?—I do not quite understand that.

25058. You would probably agree with me that the regulation of the ventilation is perhaps the most important point to be attended to in connection with the safety of the men working in the mine?—Yes.

25059. Would you place that under the contral of an overman who is a sort of fireman, independent of the certificated manager of the mine?—I would, entirely.

25060. (*Mr. Wm. Abraham.*) You do not mean to lessen in any way the responsibility of the manager, but because he is not always there you think that a man who is always there should be made responsible also?—Yes.

25061. (*Mr. Ratcliffe Ellis.*) Supposing an overman does this and there is an accident, would you make the manager still responsible for that?—Conjointly with the overman.

25062. If you take from the manager his control and give the right to the overman by Act of Parliament to alter this ventilation, and if there is a mishap in consequence, would you still hold the manager responsible?—Yes.

25063. (*Chairman.*) I imagine that an overman must necessarily be under the orders of the manager, and if the manager gave him certain orders as to ventilation he would be bound to carry them out?—Yes.

25064. (*Mr. Ratcliffe Ellis.*) That is exactly the position now. He says, to the exclusion of the manager altogether, he would place in the hands of the overman the right and duty of regulating the ventilation?—There are various responsibilities placed upon other officials, such as deputies, what we call firemen, and master wastemen, and other officials, although the manager is generally responsible.

25065. It is the manager who places that responsibility upon them?—Yes.

25066. (*Chairman.*) Would you absolutely prevent the manager having power to give orders as to the ventilation to an overman?—You could not do that.

25067. (*Mr. Smillie.*) You do not propose doing that?—No. I may say this: according to this Act there is nobody responsible for the measurement of the air. It is nobody's duty to measure the air according to the Coal Mines Act. We want it to be somebody's duty to measure the air.

25068. *Mr. Smillie.*) Not only to measure it, but to see that the ventilation is kept?—Yes.

25069. (*Mr. Ratcliffe Ellis.*) At present this is the position: the certificated manager is required to be there in daily supervision and control by the Act of Parliament. He has to depute such duties as he may consider he may safely depute to other officials, amongst others the overmen. At the present time he can authorise him, if he thinks fit, to measure the air, or measure it himself. Do you want to alter that state of things and say, whether the overman gets instruction or does not, he must have an unfettered discretion by Act of Parliament to alter and regulate the ventilation as he thinks fit?—We want to say by Act of Parliament that it is the duty of the overman to measure the air.

25070. Only measure the air?—Yes, and be responsible for the proper airing of the mine.

25071. That is, to regulate the ventilation?—Yes.

25072. If, by Act of Parliament, you put it on the overman, are you going to relieve the manager from responsibility?—They must take the responsibility jointly.

Digitized by Google

25073. At the present time they have got it jointly. The certificated manager is primarily responsible. If he appoints a competent person and that competent person does not do it, they may both be responsible? Do you want to alter that state of things?—We want to say that it is the duty of the overman to do it.

25074. I do not see how you can say that without lessening the responsibility of the manager.

(*Mr. Enoch Edwards.*) He says, I want to suggest to this Commission some way by which it shall be done.

(*Mr. Ratcliffe Ellis.*) What is not done?

(*Mr. Enoch Edwards.*) The measuring of the air.

25075. (*Mr. Ratcliffe Ellis.*) You say it is not measured once a month?—We have no record—it may have been.

25076. At the colliery you worked in before you ceased work, was there no measurement of the air taken at least once a month?—We did not see a record.

25077. What colliery did you work at?—Ashington.

25078. In the Special Rules with regard to the duties of an overman it says: "He shall examine daily the report books kept in the mine and see that the reports are properly recorded, and shall report the results of his observations each day to the manager or under-manager." This inspection of the air has to be reported. Do you not know when an inspector visits a mine, the first thing he looks at is the report book?—I do not know that. He so seldom comes.

25079. Do you say seriously that at the colliery where you are engaged this Rule was not complied with, that the air was not measured at least once a month?—I would not say that, but I have sufficient reason for saying that these reports are not properly recorded.

25080. What is your reason?—I have seen the deputies reports frequently.

25081. Have you seen the report book in which this should be reported?—No, but I have seen the deputy's report book.

25082. Then I think you should hardly make a charge like that. Have you ever seen the deputy's book in which the air was not properly recorded?—That air is not recorded.

25083. The measurement of the air?—It is not recorded in the deputy's book.

25084. What book is it recorded in?—In a book kept on purpose for that business in the colliery office.

25085. How do you know that?—According to the Act.

25086. Not that you have seen it?—No.

25087. The Act requires that it is to be recorded?—Yes.

25088. Have you any reason to say that it has not been recorded?—I am not saying it has not been recorded. I am only referring to the reports of the deputies.

25089. What reports have you seen that give you reason to believe that the report as to the measurement of air is not complete?—I have seen "In good order" where during the day the men have had to come out for want of air. I have seen the deputy's book saying it is all in good order.

25090. Do you think that all the books about the colliery are kept in that way? That is the only reason you have for saying that?—It is, really.

25091-2. What is the lamp that was used at your colliery—the one you worked at last?—There was a new introduction. I do not know the name of it; probably you will be aware which one it is; it has a double burner. The lamps I have been accustomed to—I have not seen any until just now—only had a single burner, and that burns with paraffin oil.

25093. It was supposed to be an improvement on the other, and would detect gas much sooner?—It detects gas quicker.

25094. If there was such a state of things as you suggest in a mine, and the air was so foul that although the lamp burned it injured the men's health, would you consider that sufficient compliance with General Rule 1, as to ventilation?—I would not.

25095. Have you known of a case of that sort?—As far as the ventilation in concerned you may have an adequate amount of ventilation one day, and according to atmospheric pressure the next day it may be just as bad.

25096. Have you known a case in which men worked in an atmosphere where they ought not to work?—Yes, scores of cases.

25097. Have you ever worked in it yourself?—Yes.

25098. Did you complain either to the Mines Inspector or the management as to the condition of things?—I would not say once, but scores of times. We had a case last month.

25099. Have you ever complained to the Mines Inspector about it?—No.

25100. Why?—Because the next day I would get notice, and I would have to go somewhere else and get work.

25101. You know that the Mines Inspectors receive anonymous complaints?—But the management find it out in some way or other. I knew one trade unionist who made application for the Government Inspector to come to our colliery, and he never got another day's work after.

25102. You have never made any complaint yourself?—No.

25103. As to the ambulance, everybody wishes that it should be kept at some place where it could be most conveniently got at. It is only a question of keeping it safely. Do you think the chest of the deputy would be the best place to keep it?—Yes.

25104. What is kept in the chest?—The implements for the work of the deputy, but if one chest was not big enough they could have two.

25105. It is rather the locality for it to be kept. It should be kept at the most convenient place to get at it?—Yes.

25106. Where is it kept now, on the surface?—Yes.

25107. It is important that when wanted it should be in proper order?—Yes.

25108. If a place can be suggested down the mine where it can be kept safely, that would be an advantage?—Yes, and especially with regard to bandages and splints.

25109. Those want keeping in good order?—Yes.

25110. As to the first-class ambulance certificate for deputies, have the deputies in your district generally got second-class certificates?—Some of them. Some pay attention to that, and others do not.

25111. Do you suggest that they should all have a certificate of some kind?—Yes.

25112. A certificate of competency for their work?—Of course it is rarely necessary to have a certificate of competency, but more so with regard to ambulance.

25113. With reference to inspection work and the work which the deputy has to do for safety to prevent these accidents?—Yes.

25114. Would a second-class certificate meet your view?—Yes, I think so.

25115. In addition to that, you think that he should have an ambulance certificate. Is there plenty of opportunity in your district to be taught ambulance work?—Yes.

25116. There is no difficulty in getting instruction in order to get a certificate?—No, we have these classes all over the district.

25117. I did not understand what you want with reference to Rule 39. The hewer at the present time must learn the work of getting coal before he can work alone at the face?—Yes.

25118. What is the work of the brusher in your district?—The brusher shoots the canch—what we call the canch; I do not know what you call it.

25119. The entrance to the working face, if it is not high enough, he makes it high enough?—Yes, and he is responsible for timbering the sides.

25120. You say that a man should not be employed in that work unless he has had experience for how long?—Two years, the same as the hewer.

25121. Employed in that work alone?—Yes.

25122. Supposing a man has been employed as a hewer, would you allow him to work as a brusher?—We make provision—if he has been two years in and about the face

25123. I will take a man who has to work in the roadways; if he has worked in the face would you allow him to work in the roadways?—Yes.

25124. If he has worked in the roadways would you allow him to work in the face, timbering?—In a case of

Digitized by Google

Mr. Joseph English.

27 June 1907

that description you could not prevent him being engaged, if at the same class of work two years.

25125. In the mine ?—Yes.

25126. Do you think that this might lessen the available labour in mines ?—No, I do not think so.

25127. You think that there are plenty of people sufficiently equipped for this purpose who have had this experience ?—There is plenty of work in the mine : if a stranger comes to commence work he could be set with an experienced man for the time it would take to get proper experience.

25128. You suggest this on the ground of safety ?—Yes.

25129. If it turns out, when we come to examine the statistics, that there is not any evidence of accidents from this condition of things, that might alter your view ?—Yes, if you could prove that. I am speaking from practical experience, and I do not know what statistics say on this point.

25130. It is because you think it would be safer if that method were adopted ?—Yes.

25131. As to Rule 38, why do you suggest that the employer should send a man round with the Inspectors ?—Of course you have an idea when you are in a coal mine yourself. I may be working in one district this three months, and in all probability the next three months I may be appointed by a fellow workman to be an inspector. It is optional whether the management have one colliery official to go round with me as an inspector. What use would I be going into a part of the pit where I had no idea as to the roads in and out ?

25132. This is an inspection for your satisfaction ?—Yes.

25133. You would go where you thought fit. If you had any intimation from any of the men that some particular place wanted looking at, you would look at it Why should the employer be bound to send someone to show you round the pit ?—Because I would be no use by myself. I would not know the way.

25134. How do you manage now ?—The manager sends an official continually.

25135. You want to make it compulsory that he shall ?—Yes.

25136. Have you ever had cases where he refused to give facilities ?—No.

25137. This inspection in your county is pretty general ?—Yes.

25138. You have never had a case in which you have had any difficulty ?—We want to make protection should it ever occur. What use would the Government Inspector be going to a mine if there was not someone to take him round ?

25139. With regard to coal cutting machines, are you in favour of introducing machinery into mines ?—I am, certainly.

25140. You do approve it ?—I am a great advocate of it.

25141. This stoppage would, of course, lessen the work the machine would do in a certain time ?—Yes, to the tune of two minutes in every quarter of an hour.

25142. Not more than that ?—No.

25143. Have you seen the Electricity Rules which have been established ?—I do not think there are any, are there ?

25144. Yes, there are a large number of them.—Are they drawn up by the owners ?

25145. No, by the Government. You have not seen them ?—No.

25146. Have you worked after a machine yourself ?—No.

25147. Have you seen one at work ?—Yes.

25148. There is a great noise ?—Yes.

25149. You think that the noise is so great that you cannot hear the indications which would give you notice that the roof was getting a bit uncertain ?—Yes, that is evident.

25150. You think a stoppage for a few minutes during the course of the hour would be safer for that purpose ?—Yes. One man has to timber before the machine, and he goes on before the machine, and the machine follows him up. That man cannot hear anything.

25151. (*Mr. Smillie.*) Is he not taking out timber ?—There is a man taking out and putting in.

25152. (*Mr. Ratcliffe Ellis.*) I was under the impression that there was a rule to that effect now ?—There is none for machinery at all.

25153. I know it was discussed, and I was under the impression that there was a rule of that sort. With reference to sparking, if the motor is enclosed does it spark then ?—The one I saw was at Beckworth. I do not know whether it was the Yankee. I forget the name, but I could almost have lighted my pipe by the sparks coming from that.

25154. We quite agree, in a fiery mine that would not be safe. You are speaking of use in a fiery mine where there is any danger of gas. You do not know whether they have overcome that difficulty by enclosing the motor ?—I do not know.

25155. You think the sparking could be prevented ?—Yes ; it was just what I saw at the particular time.

25156. With regard to the engine-winders being examined, have you spoken to any engine-winders about this ?—To any men ?

25157. Yes.—No.

25158. What do they think about this ?—If they were strong men they would think nothing about it, and if they were weak men they ought not to be there.

25159. There are people who do not like a medical examination. Even a strong man might not like a medical examination ?—If in a responsible position like that they ought to be subjected to one.

25160. What do you examine for ?—A weak heart.

25161. Anything else ?—I do not know. Anything that might make him incapable of performing his duties. There are various diseases that a man might have which would make him incapable.

25162. Would you make it compulsory on the mines inspector to see that the man was examined every six months ?—Yes.

25163. What would you prescribe as to the conditions under which he should cease to be employed ?—I would place the responsibility on someone.

25164. You would have to give the doctor some instructions, because it would be decided on the doctor's certificate whether the man was continued or discharged ?—Yes.

(*Mr. Wm. Abraham.*) That is a question of detail.

25165. (*Mr. Ratcliffe Ellis.*) Yes, it is a very important detail, I think. Would you say upon a doctor's certificate that this man's services should be discontinued or continued ?—That would be the only guide we could get.

25166. What doctor do you suggest should examine the man ?—Some official. That would be a provision for you to make.

25167. You merely suggest examining him medically once in six months ?—Yes.

25168. (*Mr. Smillie.*) Would you give him the right of appeal to another medical man ?—Yes. Why should he not undergo an examination the same as anybody else ?

25169. Mr. Ellis's point is this, and it is an important question to enginemen. He agrees with you that if he is in such a weak state he should not be there, but if he is examined by someone, would you give him the right to appeal to someone else ?—Yes, we could not prevent him.

25170. (*Mr. Ratcliffe Ellis.*) I wondered if you had talked it over with the enginemen before making the suggestion ?—No, we have not.

25171. Now as to the haulage roads, there is no danger in walking along when the traffic is not going along the road ?—None.

25172. Except to the men who may be working in the road ?—There is no danger there if the trams are not going.

25173. Supposing there are cases where it might be awkward to increase the width of the road, would it meet your views if there was no travelling allowed whilst the machinery was in motion ?—It would meet our views providing it could be practicable for the management, but I think it would be impracticable.

25174. What are the widths of the roads in your colliery generally—I mean these haulage roads ?—Nine feet is general.

25175. There is room enough in nine feet ?—Scarcely. There is from nine to ten feet.

25176. Do you think that there should be sufficient room on one side for passing where men have to go along the haulage roads ?—Yes.

Digitized by Google

25177. You recognise that in an old colliery it might be difficult to find separate travelling roads ?—It would be a bit expensive.

25178. With regard to timbering, you would suggest that there should be one uniform distance throughout the whole kingdom, I understand ?—Yes, throughout the whole coalfield.

25179. That is without regard to the condition of the roof, or anything, that timber should not be more than four feet from the face anywhere ?—Yes.

25180. I suppose that it might be so near the face as to make it inconvenient to work ?—Four feet is not inconvenient.

25181. It might be ?—Yes, if the stone were of such a nature that it would make it inconvenient. Sometimes you have to work that timber right up against the face ; it depends upon the nature of the stone.

25182. In the same way as there is a maximum distance about spragging, you would make a maximum distance for props from the face. You say they should be four feet ?—Yes.

25183. Do you think that the fact of prescribing that as a hard-and-fast rule would make men think that was all that had to be done, and lessen their feeling of responsibility to people about them, to see if any more wanted to be done ?—No, that would not remove the responsibility.

25184. It would not have that effect ?—No.

25185. (*Mr. Enoch Edwards.*) With regard to this question of lamps. The lamps you have you can see well with, and it is considered to be a good lamp for detecting gas, but you may work in poisonous fumes and your lamp burns all right ?—That is so.

25186. Is that not rather an indication that the ventilation is bad ?—If there is a sudden change of the thermometer the foul air comes from the goaf. It may be all right in the morning, but it renders that place obnoxious, and men can work by these lamps, whereas they could not work with the older kind.

25187. Do you think the present law is being carried out, that there should be always sufficient ventilation ?—There is not sufficient ventilation in the mines at all times.

25188. If the present law was carried out you would get rid of that difficulty ?—Yes, if the places were properly aired with sufficient air in the different districts.

25189. Are these gassy seams you refer to ?—It is not inflammable gas, but it is of a gassy nature ; it is more the stythe which comes off the goaf—foul air. It is poisonous.

25190. If it was highly inflammable gas there would be an obligation on the colliery people to clear it out ?—Or otherwise prevent the men going in.

25191. You could not work at all ?—No.

25192. Do you suggest that they are lax with regard to the ventilation ?—If they had more gas to attend to the collieries would be better ventilated. We had a case at one of our collieries where a man was almost suffocated from foul air, and yet gas could not be detected.

25193. Your mines are not alone in that respect ; where there is no fear of an explosion there is a tendency to neglect ventilation ?—We have nothing to contend with in Northumberland so far as inflammable gas is concerned. Very few of our pits are subject to that. We have more to contend with in foul air or stythe.

25194. They are not sufficiently ventilated ?—No.

25195. It is the business of deputies to do this timbering ?—According to the Act, it is the duty of the man, but of course this is also a suggestion that the deputy should be responsible in his presence, and in the absence of the deputy the workman to be responsible.

25196. Your customs are similar to Durham in reference to timbering ?—I do not know the system in Durham.

25197. The deputy is not known in any coal mine in the kingdom except Durham and Northumberland. We were told yesterday that his duties were to see to the timbering of the place ?—Previous to the 1887 Act coming into operation it was the duty of the deputy, and he always used to attend to the timbering, but since that Act came into operation he throws it on the workman.

25198. When you suggest that there should be a fixed distance for timbering of four feet, do you do that with the knowledge that the men would have to set it ?—In the absence——

25199. Never mind the absence ?—Yes.

25200. Is that a proposition to which your men assent—that they should be forced to put up timber for four feet ?—No, we simply make that suggestion.

25201. Is the suggestion you are making to apply to Northumberland only ?—I should say that it should apply to the whole of the coalfield.

25202. The whole of the coalfield of Northumberland ?—Where this Act extends to.

25203. Have you had any experience of any other measures than those of Northumberland ?—I have not worked in other mines except Northumberland.

25204. There are peculiar ways in many counties. You have had no other experience ?—I have not worked in other mines except in Northumberland.

25205. You think in Northumberland that there will be no difficulty in having a fixed definite limit ; whether the roof is bad or not it should be set four feet ?—There are Special Rules for Durham and Northumberland.

25206. With regard to this timbering rule, you suggest that timbering should be set whether required from the nature of the roof or otherwise : so far as you can see it should be set compulsorily every four feet ?—Yes, and to be uniform throughout the whole of the coalfield.

25207. You make that suggestion from your knowledge of Northumberland only ?—That is so.

25208. You do not know how that would affect other parts ?—No, our districts suggest what would best suit them, I suppose.

25209. When asked about travelling ways you suggested that there should be a travelling way along the main roads ?—I am acting as compensation agent in Northumberland and part of my duty is to attend the inquests and ascertain the causes of the accidents. At one particular colliery there was a man working and there was no travelling way and no width between the ways. This man was getting into a refuge hole when a set caught him and knocked him down ; he was a yard or two off the refuge, and had he got in he would have been all right, but there was no means whatever of saving him.

25210. When the previous Act was framed the pretty general consensus of opinion was that there should be some refuge place where a man could fly in case of danger. Do I understand you to suggest now that instead of manholes there should be a permanent width of way for a man to travel in and out ?—Independent of the refuge holes. I think the refuge holes should be 10 or 12 yards apart. They could be continued.

25211. Would that be necessary if you had a permanent way ?—I am afraid it would be, because they have to be at least six feet in from the way—that is the refuge holes. They must be six feet clear, and if we had a travelling way three feet wide it would not be sufficient in case of a set getting off the rails.

25212. It would not afford the same security. If a man is too near the run-away tram there would be not the same protection ?—There would not, unless he had a refuge hole.

25213. If you make your main roads sufficiently wide in the first instance you could make a side road ?—Yes. It takes six feet for the tubs to pass each other and we drive them nine feet to ten feet, and there are three feet available nicely for a travelling way.

25214. What do you do with that three feet now ?—They just stow it up with anything.

25215. With rubbish ?—Yes.

25216. You think if the rubbish was kept clear you would be able to have a roadway ?—Yes, that could be nicely made from the shaft to the face.

25217. Where you have haulage by machinery in these lanes or otherwise, are men allowed to travel the road while the traffic is in motion ?—In some cases they are : in some cases they re not. In most cases they are.

25218. Have you difficulty where men are forbidden to travel them from their persisting ?—No, if they are forbidden they do not travel along them.

25219. When you were dealing with the question of the unskilled man, Mr. Ellis put to you a question as to whether there were statistics to prove that the percentage of accidents was greater with men who worked by themselves who were unskilled, and, I think, you said you did not know any statistics ?—I do not attach any importance to statistics on this question. I attach importance to what I ascertain when an accident has occurred from that source, and if there is a possibility of preventing the recurrence of these

Digitized by Google

Mr. Joseph English.

27 June 1907

accidents, I think it is worth consideration: that is a sufficient reason for me to make these suggestions.

25220. I understand you to say with the coal hewer at the face that clause has worked satisfactorily?—Yes.

25221. You suggest to the Commission that the same clause should apply to men engaged in continual working in ways, and where men are engaged in setting and drawing timber the same rule should apply?—The last accident we had was exactly through a man of that description. He had been 12 months and knew little about the working of the mine, and was set to work by himself, and the consequence was he did not sufficiently protect himself and it came down on him and crushed him.

25222. (*Mr. F. L. Davis.*) With regard to this question of lamps, your complaint, I understand, is that y u can only detect the gas, and it does not shew the other noxious gases which are injurious to health?—No.

25223. You know what Rule 1 says about an adequate amount of ventilation, that it "shall be constantly produced in every mine to dilute and render harmless noxious gases to such an extent that the working places of the shafts, levels, stables, and workings of the mine, and the travelling roads to and from those working places shall be in a fit state for working and passing therein"?—Of course they are not always in a fit state: we find frequently they are unfit.

25224. Your complaint is that Rule 1 is not properly carried out?—There is not a sufficient quantity or air conducted round the ventilating districts.

25225. The reason for that may be because your mines are not very gaseous—not very dangerous?—They are not very dangerous.

25226. Not with inflammable gas?—No.

25227. Do you consider that what you say is a very general state of things?—Yes, I should say it is. If there is a good force of air it keeps the stythe in the goaf. If there is not a good force of air, this stythe comes back on to the working places.

25228. Do you think that the state of things obtains generally in Northumberland?—Yes, we have frequent complaints in all directions in Northumberland for want of proper ventilation.

25229. What is the system of ventilation?—Mostly fan.

25230. If this was a general state of things in your district, have you not drawn the attention of the Mines Inspector to it?—On some occasions we have.

25231. What has been the result?—There has been an improvement for a short time.

25232. Do you know in what way improvement has taken place? Has the fan been moving quicker or have there been more revolutions, or an alteration in the system or what?—A better system of conducting the air from the face and into the workings. When I worked in gassy mines we had a system of wood brattice taking the air in by the wood brattice, but now where there is no gas there is no system whatever. The air just has to come in any way it can, and is conducted in an imperfect manner around the face.

25233. I do not quite understand the position. You have spoken to the inspectors and in some cases it has been improved for a time?—Yes.

25234. Do you say, really, that the same state of things generally obtains now although the inspectors have been spoken to about it?—Yes, it very frequently happens: whenever we find a change of atmospheric conditions we find it frequently.

25235. You are constantly approaching the inspectors then?—No, not constantly. In every case that occurs we should not approach the inspector. If we did we should be continually approaching him.

25236. You do do it?—Yes, in some cases, but not very often.

25237. It occurs to me if the thing is so general and so serious, that it would be your duty to bring this very forcibly before the Mines Inspector?—We get more relief by appointing our working inspectors every three months, when every place in the mine is inspected by the working inspectors appointed on behalf of the workmen, and if they find any defect in going round the workings it is their duty to enter it in a book kept for that purpose at the mine offices, and that book is sent to the Government Inspector for inspection. We frequently have reports in that book where certain places in the mine are short of ventilation The Government Inspector can examine that book whenever he cares to do so, and there is a proper record kept every three months. Every place is examined by the working inspectors.

25238. That I know, but apart from your workmen's inspections have you called the Mines Inspector's attention frequently to this?—I could not say frequently.

25239. You could do so by anonymous letters. We have been told by inspectors that they get a large number of anonymous letters. The men are not penalised in any way for doing that?—There is a hesitancy on the part of the workmen frequently. It is a serious thing, sending for the Government Inspector, in the eyes of the management. The men who are dependent for their work and livelihood hesitate very much before they take that course. If a man interferes and is the cause of a Government Inspector coming, he can look out, because when the first opportunity arises he goes.

25240. You do not understand me: there is no reason why the man should be found out. The inspector does not say he has had a letter. He comes without notice, or only a few hours' notice to the manager, to inspect the mine because he has had an intimation that things are not as they should be. He does not tell the manager that?—But he goes to the place that the report is sent from, that particular place that may be bad, and the management have curious ways of getting to know these things.

25241. My impression is that he would be a foolish man if he went straight to that place. That is my view, and my experience is that they do not generally do so?—We have the experience of knowing what a workman has to contend with when he looks after the interests of those around him.

25242. Surely it is not to the interests of the Mines Inspector to let the management know that he has had a hint that things are not right. He does not want the men to suffer if things are not right: he has to see that they are put right, and he does not want the people who have drawn attention to it to suffer. I do not think that the Mines Inspector will let it out in any way if he has had private information?—It is str nge how the management get to know persons who make complaints.

25243. Your complaint is that Rule 1 is not properly carried out?—That is it, and we want the duties of carrying that Rule out imposed on the overman. In the Special Rules other officials' duties are set forth, and it ought to be set forth in them that measuring the air is the overman's duty.

25244. That is what you said to Mr. Ellis, but I do not understand that. Your mines, generally speaking, are not dangerous from gas?—No.

25245. You said that the sparking of the coal-cutting machines was dangerous where there is gas?—Yes.

25246. That is not in many places even in your district?—Where there is no gas it is not dangerous, but where there is gas it is dangerous.

25247. You have not much gas?—No, I am speaking generally, when I am speaking of the sparks emanating from the coal-cutting machines.

25248. You said that you have noticed that accidents were increasing where machines are used?—I do not know whether I said "increasing": I said they were frequently occurring.

25249. I understood you to say that they were increasing, but I may be wrong. Have you any figures or have you any statistics yourself to ascertain whether that is so?—We had three accidents within four months. One accident occurred where the man was actually only five yards in before the machine, timbering—putting timber in, and taking timber out, and five yards from that machine the accident occurred, and another man was working at the bottom, only 22 yards away, and he could not hear the stone fall, and the man at the machine did not know that the accident had occurred until his machine was stopped.

25250. That is a fall of the roof?—Yes. There were five gears broken down, and if the machine had been stopped they would have been sure to have heard that stone working.

25251. That is the real cause, in your opinion, of the extra danger—I mean the noise of the machine?—Yes.

25252. That is the chief cause for more accidents by using the machines?—Yes.

25253. That is why you suggest a stoppage of two minutes every quarter of an hour, or a stoppage of some kind, to hear what is going on?—There is no precaution at present for preventing accidents by coal-cutting machinery, and we think that there ought to be some precaution,

Digitized by Google

and that is why we make the suggestion. We are in favour of coal-cutting machinery, and we think that every encouragement should be given in that direction, but it is in order to prevent accidents arising from the use of these machines that we are anxious about it.

25254. Do you consider that those machines are advisable, because they work coal that otherwise would not be worked?—Yes, we can get an average produce of six tons, whereas we could not get 2½ tons by hand. The seams could not be worked by hand that are worked by the machine.

25255. Generally you want to impress upon the Commission that since these machines have been introduced, there are not sufficient precautions taken for keeping the top up?—Yes.

25256. With regard to overmen, your great point about the overman being responsible for ventilation. I see in the Special Rules, No. 7: "He shall examine the barometer and thermometer at the bank before going down the pit, and register their indications; and caution the deputies when any sudden or unusual change has taken place"?—That is part of his duties defined here. We want the other part of the duties defined, that he shall also have the charge of the measuring of the air in the splits."

25257. "He shall inspect such parts of the mine as may be reported to him unsafe and in any way needing his attention, and so far as practicable remedy any defect"?—We want inserted there to be responsible for measuring the air in the different splits.

25258. Paragraph 6 is: "He shall, under the direction of the manager or under-manager, have the daily supervision and responsible charge and control underground of the mine or portion of the mine, and when by nomination and appointment acting as under-manager he shall perform, in addition, the duties of under-manager." That does not go as far as you want it to go?—I do not see any reason why his special duties should not be defined, to be responsible for measuring air in the different portions of the mine.

25259. Mr. Ellis said you make him responsible, but I do not see why you take away the responsibility from somebody else?—Why specify his duty in one part of the Rules?

25260. (*Mr. Ratcliffe Ellis.*) You want to have a Special Rule to provide for what shall be done. In Lancashire there is a Special Rule with reference to the under-manager: "He shall see that at least once in every month the quantity of air in the respective splits or currents is measured and entered in a book as provided for by General Rule 1"?—They simply have in Lancashire what we want in Northunberland.

25261. You want in the Special Rules a provision something like the Lancashire Rules?—Yes.

25262. (*Mr. Smillie.*) Nobody is bound to draw up certain rules of that kind unless it is an Act of Parliament?—If it is essential for Lancashire, why should it not be essential for Northumberland?

(*Mr. Ratcliffe Ellis.*) Still, the certificated manager is left in control.

25263. (*Mr. Smillie.*) What is the general system of working in Northumberland? Is it stoop and room or longwall?—It used to be what we call "board and wall," but most of the seams are now longwall working.

25264. Your thin seams working by coal cutting machinery are longwall?—Yes.

25265. The board and wall system was done some years ago?—Yes, largely, and it is much worse to ventilate than the longwall.

25266. You have some of that still, the board and wall?—Yes, seams you could not work very well in any other way in Northumberland than board and wall—in thick seams.

25267. You have 25 machines?—Roughly speaking.

25268. Is that 25 collieries at which machines are engaged?—No.

25269. In one colliery there are five or six?—A very large colliery, but I could not exactly say the number.

25270. You have not worked at a coal cutting machine yourself, but you have been down examining the workings for the satisfaction of your own Association as to their safety and what provisions will be required?—I worked at the pit where they were frequently used and I was very often in.

25271. Although not a workman at the machine, you were in?—Yes.

25272. Is it possible for a person to hear another person speaking when a machine is cutting?—No.

25273. Supposing anything went wrong with a person, or they recognised that there was some danger and they shouted at the top of their voice, it is impossible for the men behind the machine to hear?—They could not hear.

25274. The noise is deafening?—Properly deafening.

25275. You said one man went before the machine to set timber and another one came behind to set timber as it went past. There must be a clear passage between the coal face and the timber for the machine to get up?—2 ft. 6.

25276. If there are any props set in that way, a person going before the machine removes them, and puts the props in a line in order to get the machine through?—Yes.

25277. In longwall working, where it is not done by coal-getting machinery, or in any other method of mining, the experienced miner depends largely on his hearing?—Yes.

25278. You guard against falls of roof?—Yes.

25279. Sometimes even in the breaking of the roof, not only does he hear the sound, but little bits fall on the floor and warn him?—It is very seldom that the stone will come down unless it gives a certain amount of warning, and if he hears that warning he may escape an accident.

25280. If two or three men were working at the coal face, and one of them heard a sound that he thought to be a warning, he would at once shout to his mates to keep quiet until he could ascertain what the nature of the roof was?—Yes, and get out of the way as quickly as possible.

25281. Provided he hears the warning, it is all right, The crazing, we know, is the sign of danger from a fall?—Yes.

25282. The machine starts at one end of the run, and unless something goes wrong it continues to the other end, three or four hours?—They are generally on a system of cutting 90 yards in eight hours.

25283. They do that continuously, providing nothing goes wrong?—They are introducing this new system of conveyors. I do not know whether you understand that.

25284. We have not had any evidence with regard to the conveyors, that is, conveying coal to the road head, where it is filled by machinery?—Just like a screen, it runs about 90 yards, and is about 2 ft. 6 wide. The distance for the machine, added to this, makes the face nearly 5 ft. from the timber.

25285. It also, being worked by machinery, gives rise to a considerable amount of noise?—Just about the same as the machine.

25286. If the method which you have stated is the method of timbering in some parts of France were adopted, steel straps, with a prop under one end and the other end put over the coal head, it would minimise to some extent the danger from falls?—Yes, it would increase the safety and reduce the danger from falls?—Yes, it would increase the safety and reduce the danger.

25287. Would you suggest at what distance these beams or straps should be set—2 ft., 3 ft. or 4 ft.?—They should not be above 3 ft.

25288. That would largely depend on the nature of the roof?—Yes.

24289. Are you satisfied that Rule 38, which gives you the power to appoint two persons who are working miners, is sufficiently strong?—Yes, providing our suggestion is carried out that it is the duty of the manager to send one of the officials.

25290. That is a different point. There has been considerable amount of evidence given here with regard to this question. The persons appointed by the workmen must be working as miners at the time of their appointment?—Practical miners.

25291. They must be working at the time of their appointment. Have you no objection to that in Northumberland?—No, I think it is better than having—of course you could increase your Government inspectors, but I do not know whether it would be wise to make a special class of inspectors for that purpose.

25292. It has been suggested that this Rule might read persons who were or have been practical working miners might be appointed by the workmen. How would Northumberland miners feel towards that?—We have not put

Digitized by Google

Mr. Joseph English.

27 June 1907

that point before them, because they are fairly satisfied with the present arrangement. The county that has most taken advantage of that Rule has had it in operation ever since it was established.

25293. You are satisfied with the present Rule, provided the management were bound to do what they do in your county—send an official round with the examiner?—Yes.

25294. That is all right if you are satisfied with that. You stated that workmen did not care to make any complaints of bad ventilation to the mines inspector because of the fear of dismissal?—Yes, we have had more than one case where that has occurred.

25295. How do you square that statement with your statement that you take full advantage of Rule 38, that the workmen appointed are not afraid to make an adverse report?—Not generally. There may be some. We have not found that, but the management regard sending for the Government Inspector as a serious question, because they run the risk of losing their certificates should the Government Inspector find that there is neglect in the work.

25296. Where you appoint two men to examine a colliery, if they find any fault with the ventilation, or point out any dangers, they are bound to enter them in a report at the colliery, and the manager is bound to send them on to the Mines Inspector. Does not that have the same effect?—No, I do not think they are as anxious; at least, they do not take action with regard to the workmen as far as that inspection is concerned, but they regard sending for the Government Inspector as a serious matter.

25297. It is unnecessary for a workman to send to the Government Inspector. Could he not be sent for through the checkweigher, or through your General Secretary, Mr. Straker? Would not a complaint to Mr. Straker at once have the Government Inspector sent for?—Yes.

25298. That would not bring the workmen into it?—We could bring him any time by sending a note to the general office or the working office, but it is looked upon as a serious state of affairs when you have to bring in the Government Inspector.

25299. Is Rule 39, which provides that a person must have two years' practical experience at the coal face before he can take charge of the place, generally carried out?—As far as the coal-getters are concerned, that is carried out.

25300. If a manager put three or four unskilled persons under the charge of one skilled person at a longwall face in your county, do you think that would be carrying out, this clause of the Act?—No.

25301. Supposing two unskilled persons were going to work at the coal face, in your opinion would that carry out this clause?—The only way, in my opinion, of carrying out the clause of that Act is for the unskilled man to be accompanied by someone, it does not matter whether two, three, or four. If he is working with skilled men for two years he is a skilled man.

25302. Do you not know the clause says "shall not work alone"?—He does not work alone.

25303. Supposing two unskilled persons are together, they are not alone?—They are not, but they are unskilled.

25304. But they are not working alone?—They are working together.

25305. If you were told that the Law Courts have held that two unskilled persons working together are not working alone, and, consequently not breaking this clause, you would think that an alteration was required?—You are not getting clear of the Mines Act by having them together.

25306. You do not think that is the intention of clause 39 of this Act?—My idea is the intention of that clause was that an unskilled man must be working with a skilled man.

25307. That he should serve an apprenticeship to take care of himself?—That is the intention of the Act.

25308. Can you say whether the deputies' districts in your county are small enough to enable the deputies to carry out their work under the Act of Parliament?—Under the present system I think the number of men a deputy has to attend to, and fire shots where he is required to fire shots, are too many. He could not do justice to the work. I think about 16 men is the number a deputy is to look over, but if he has to fire shots for these 16 men he could not do the duties satisfactorily.

25309. Is the number limited or fixed by Special Rule?—Fourteen to 16, I think. It is about an average of 14 to 16.

25310. It may be more or less according to the nature of the district, perhaps?—Yes.

25311. The first duty of the deputy should be to look after the ventilation and the general safety of the men employed at the face?—Yes; we look upon him as the man to look after the safety of the men.

25312. Is it the opinion of the Northumberland miners generally that the position of a competent person to fire shots and the position of deputy should be two different positions?—We have not had that matter discussed. We have privately thought about it, but I think if the number of men he had to attend to was reduced that that would meet the case.

25313. As a matter of fact, you think the district or the number of men they have to look after should be fixed at a point, so that the deputy could devote his whole time to looking after their safety?—Yes.

25314. Has the deputy any other duty with regard to haulage, or taking out the coal, or is he called upon to put on tubs in the road?—Yes, that frequently occurs. If anything happens the first man they send for is the deputy.

25315. He might be employed at the face putting in brattice, or doing other safety work, and he would be called out, and his first duty would be to go?—Yes, any time he is called away to go away, probably out of sight of the flat.

25316. Do you think that it is advisable that the deputy should be called away from his real duties to do work of that kind?—I do not think it is necessary. It is not desirable in any way.

25317. If it could be prevented it would be wise?—Yes.

25318. With regard to haulage accidents, there is a considerable number of accidents arising from haulage?—Yes.

25319. Have you a method of hand-drawing by a single tub in your county?—Endless rope, that is single tub.

25320. Is there any such thing as workmen conveying single tubs from the face to a lye?—Yes, lads.

25321. All horse haulage or mechanical haulage?—Pony haulage mostly.

25322. You have no hand-drawing at all?—We have in some places.

25323. Even on a horse road where a lad is driving a horse or a pony, he can be going with one tub or four or five tubs. Do you think it would be wise or necessary to have sufficient room at the side of the road for the pony driver or the man to get to the side?—You could not do that in bye-side of the flat. We have one big pit employing 400 men where they have single trams. We have a few, not very many.

25324. Did you not tell Mr. Edwards that you drove your places 9 to 10 feet wide?—Yes, the main intakes.

25325. Are your ordinary gate-ends and longwall workings driven 9 to 10 feet wide?—Yes, and as soon as they get to work they are broken, and they sometimes come in at the sides until only 5 feet.

25326. That is coming in?—Yes.

25327. What width are the buildings put in in the ordinary roads?—The packs, do you mean?

25328. Yes?—About four feet. That is in the gateways.

25329. They are built 4 feet wide?—Yes.

25330. There is practically only room for the single road, and not room for passing?—If the boy gets off he can scarcely get by the tub to put it on.

25331. Is that desirable?—No, if you could avoid it.

25332. Could you not be building the packs wider?—If you did build them wider the weight of the strata comes on, and the bottom heaves, they come in in two or three days, and you would have to increase the width.

25333. If they were 9 feet wide and the weight came on the packs they would come in a certain distance?—Yes.

25334. Supposing they came in 3 feet, they would still leave it 6 feet wide?—Yes.

25335. If there were 4 feet to begin with, and they come in 3 feet, you do not leave more than 1 foot?—They could not come in that much.

25336. You really pack them 4 feet now?—Yes.

25337. How far do the packs come in?—The packs in the longwall sometimes do not come in very far, but it is the broken pillars in the higher seams.

25338. We are dealing with the longwall now. What width do you pack them?—Four feet.

Digitized by Google

25339. They do not come in very much ?—No.

25340. If you packed them 4 feet and they did not come in much, you would have room then ?—Yes ; it would increase the amount of stone-work considerably.

25341. We are not concerned at the present time so much with that as with the safety of the men. Has there been any accident from these roads being so narrow that a person could not pass by the side of a tram ?—I am not aware of accidents from that. I have known an accident occur from the place not being sufficiently high where the timber has got broken down and a boy has got his head almost taken off.

25342. Are your workings fairly flat ?—Yes.

25343. There is not much of a gradient ?—No.

25344. You could conceive where, if there was a steep gradient of 1 in 2½ or 3, or even 4, that there might be considerable danger of a full tub coming down and a person not having room to get off ?—I can see the danger, but I do not think that has frequently occurred with us. It would be a difficult thing to keep the working place that width.

25345. You do not think it would be necessary to legislate for that ?—No.

25346. You were asked by Mr. Ellis with regard to trailers or devils on the back of the last tram of a train of tubs going up a heading. Did you say that was not necessary ? —No.

25347. You do think it is very necessary that there may be something of that kind ?—I think it is really necessary.

25348. You have runaway points at the present time on your haulage roads ?—Switches.

25349. So that if the rope breaks, or a coupling, or a draw-bar, they will be switched off and not run down ?—They are mostly for sets, and to make provision for the rope breaking. These switches switch them off the rail. We also have " cows " at the back of the tubs.

25350. They have a trailer on the back of the tram ? —Yes.

25351. It has been suggested that sometimes a runaway takes place where a train of trams has to go down lower, down below the dook. In that case you could not have a cow or trailer on, because it is the wrong end first ? —Yes.

25352. It has been suggested that a continuous chain from the end tub should go over the top or end tubs, so that if a coupling or draw-bar broke it would prevent part of the train running away. If it was proved that that was effective in preventing a runaway, do you think it would be wise to make it compulsory by law to have that ? —Providing that such an apparatus could be invented.

25353. Supposing we tell you that it is invented, and in use at many collieries, and has been found of great service, what would you say ? You can notice at once as a practical man that there is very little expense or time in it. It would not be inconvenient to do a thing of that kind ?—No.

25354. Do you think it would be wise to do that as a precaution against runaway trams ?—Of course, because you could not use too much precaution against runaway trams ; it is a very dangerous thing. Mr. Straker reminds me that there was a man killed last week because there was not one.

25355. Have you had any accidents in Northumberland, so far as your knowledge goes, in which a person working alone, either at night time or at some distant part of the mine, has been killed and it has been some hours before he was discovered ?—We had a man working in the waste. He did not get killed, but he tried to extricate himself, and the more he tried the more the stone came in, and he gave up. We have them frequently working by themselves.

25356. Would it not be wise to provide that a person should not be allowed to work alone ?—That is the reason why we suggest the two years.

25357. You suggest two years at the coal face. At the present time a man might be employed in repairing work on the roads alone ?—By the face is understood inside the flat. I do not know what you call it in Scotland.

25358. We call it the lye. There have been accidents to persons who were repairing on the main haulage roads, sometimes working all alone ?—Yes, that has occurred, but I do no see that you could make it compulsory for two men to be always working together.

25359. You favour the idea that wherever possible a person should not be employed alone ?—Yes.

25360. Either at coal-getting or any other dangerous work ?—That is our idea.

25361. Have you any drawing of timber in your board system at the pillars ?—Yes, we have a lot of drawing.

25362. Who draws the timber ?—A special man appointed for the purpose.

25363. Deputies, or special men ?—Special drawers.

25364. Who draws the timber in the longwall ?—Special drawers set down for that purpose.

25365. Not the deputies ?—No.

25366. Are you ure of that ?—Yes

25367. Supposing a person speaking on behalf of the deputies of Northumberland told us different yesterday, what would you say ?—That may occur at their particular collieries.

25368. (*Mr. F. L. Davis.*) You said that these stretchers and bandages and other things should be kept in the deputy's chest ?—Yes.

25369. Where is that generally in your pit—at the bottom of the pit ?—Close to the working face.

25370. How near to the working face ?—Generally about 200 yards off.

25371. On an average about 200 yards ?—Yes.

25372. Does he keep that chest in a little room ?—Yes.

25373. His room, I suppose it is ?—Yes.

25374. (*Mr. Smillie.*) It would be safe from danger of falls ?—Yes.

25375. (*Mr. F. L. Davis.*) He keeps his books there, too ?—Yes, his tools.

25376. And any odds and ends ?—It is cut out of the rock. He has his seat and keeps his clothes there as well. It is practically his office.

Mr. JOHN REES POWELL, called and examined.

STATEMENT OF WITNESS.

25377. (1) I am of opinion that the Mines Act should be rigidly enforced, *i.e.* (1) A plentiful supply of timber be sent into the workings to the parts of the mine stipulated in General Rule 22, and of a suitable character. I would advise all caps, or lids, for upright posts, be of good length and thickness and be prepared on the surface, and sent into the mine in sufficient quantities for all use. I would emphasise the need for all timber to be set in a proper manner, leaning at the right angle, and of sufficient hold in the floor, *i.e.*, stamping, all sprags used in the coal face to be set properly at the required distances, with a tapered wedge of wood against the coal at the end of the sprag nearest the coal face, and would recommend that where places require to be made higher on underground roads and timber has to be taken out, it be done by means of a timber-drawing appliance and the necessary bars for the purpose. Should a fall occur, workmen and officials should see that the cavity or holes are covered up before any traffic or passage of persons were allowed, and in every case the officials should see all timber on the roadways is properly cut and set.

(2) If the hours and duties of the Colliery Examiners were reduced in number, then greater opportunities would be presented for enforcing the rules framed for the miner's safety. Accidents arise now from falls of roof and sides owing to postp nement on the part of the miner of these acts necessary for safeguarding his own life. Better supervision—possible only with reduced duties and hours—would make accidents less possible.

(3) With regard to shot-firing, I would point out that when done during shifts, it is done at a time when by the traffic of men and horses most dust is raised in the roadways. As this is the finest dust, and carried by the air, it is also the most dangerous.

Digitized by Google

Mr. John Rees Powell.

27 June 1907

(4) As specified in the Monmouthshire and Forest of Dean Code, Special Rule 11, and according to General Rule 4, the examination before commencement of each shift; that in all cases the examination, or inspection, of the workings should be made with a locked safety lamp, and in every case except where gas has not been found within the preceding twelve months, by a lamp more sensitive to the presence of fire-damp than the Davy, as well as the ordinary lamp now in use, so that all presence of gas or cap might be noted. I think this rule should be altered thus:—that instead of one examination before each shift, and the examination made during the shift as now, there hould be an examination before the commencement of the shift as now, and at least one other during a shift of eight hours, and that in collieries where there are two shifts working night and day, the examiner be relieved at the end of his eight hours and other examinations made by the relieving examiner, and that a true record of all examinations be entered in the report book, and by so doing there would be recorded at least six examinations in the 24 hours. And whenever no one is in the mine or district, he should be accompanied by someone during his examination.

(5) I think also that the competent person mentioned in General Rule 4 and Special Rule 11 should have shown his competency by his practical experience and by examination, and I would suggest an examination instituted for all colliery examiners, and in each new appointment that practical men with such certificates should have the preference for such appointments.

(6) Whenever Special Rules need amending, or instituting, that there be representatives of all classes engaged in the mine on such board, especially examiners, as they are the persons who are employed to see that the Act is applied in very many instances. They could possibly offer many useful suggestions in the formation of rules.

(7) The workmen should be given a copy of the Rules and should be encouraged to ascertain what is contained in the book presented to them, and whenever a new copy is required the same should be had on application to the colliery officials or management, and new copies should be given out every year to all who require them, and prizes should be offered to workmen, or certificates for the efficiency in the knowledge of the Act or Special Rules.

(8) It should also be the aim of all officials to see that the Act is properly carried out, and they should frequently inform the men under their charge of the requirements of the Act; and every workman with a boy under his charge should assist him in acquiring a full knowledge of all appertaining to him to good discipline in mines.

(9) There should, as far as possible, be a mutual understanding between the officials and workmen, and every effort made to respect those in charge, and it should be the duty of each man to see that each boy under his care is not allowed to remain about the main roads at the commencement of the shift, and each person, unless on business, should at once proceed to his working-place beyond the zone of all traffic.

(10) There should be special facilities in every colliery for rescue work, and there should be men chosen in every colliery to learn all new methods of applying rescue apparatus. There should be a central station in each mining district where this knowledge might be obtained, and at every colliery sufficient rescue apparatus kept for any purpose that may arise.

(11) In every colliery ambulance work should be encouraged, and instead of it being stated in General Rule 34 that ambulance or stretchers, with splints and bandages, shall be kept at the mine in case of accidents, it should state that they be kept in each district, and such other things as may be necessary for use in case of accidents, and that the same should be kept in a box for the purpose, and the names of all ambulance men should be posted up at the pit head or other entrance to mines in a conspicuous place, also the districts in which they are engaged, so that in case of injury to any person they may be sent for without undue delay.

25378. (*Mr. Ratcliffe Ellis.*) You are a colliery examiner of Vivian Colliery, Abertillery, and are General Secretary of the Monmouthshire and South Wales Colliery Examiners' Association?—Yes.

25379. What exactly is the nature of the Association?—It is an association of underground examiners and deputies

25380. What are examiners?—Men who examine for the safety of the mine.

25381. Firemen?—Yes.

25382. (*Chairman.*) What is the difference between a deputy and an examiner? A deputy is supposed to be the same as a fireman?—Not in our coalfield.

25383. What is the difference?—They call them deputies because they are deputed to fill our position during our absence.

25384. He is a deputy fireman?—Yes.

25385. (*Mr. Ratcliffe Ellis.*) First of all you deal with the question of timbering?—Yes.

25386. Have you any suggestions to make in addition to those which are now provided for in the General and Special Rules as to timbering?—Yes. What I have mentioned here I think would be of great benefit to the safety of the miners.

25387. You say that there should be a plentiful supply of timber?—Yes.

25388. That is required now?—Yes.

25389. It is not complied with, you think?—In nearly all cases, but there are cases where it is not.

25390. Where there is not a sufficient supply?—Yes.

25391. You think that rule which now requires that there should be a sufficient supply of timber should be complied with?—Yes.

25392. Have you anything more to suggest about the quantity of timber that should be sent down? Should it be cut into different lengths, or are you satisfied with that? I see you say you would advise all caps or lids for upright posts to be of good length and thickness, and be prepared on the surface and sent into the mine in sufficient quantities for all use. Can you tell me what length is required?—If there is a lid supplied on top it would materially assist the miners in getting these props up when called for immediately when a sudden squeeze came on.

25393. Would you put one or two lids?—One would be sufficient, providing you had the prop long enough.

25394. They should be supplied on the surface. Are there lids made now?—Not in all cases.

25395. You think that should be done on the surface. If the prop was not long enough you could put a lid on and make it long enough?—Yes.

(*Mr. Wm. Abraham.*) A lid is placed on top of a prop, and covers the greater part, and a great deal depends upon the way that lid is made in order to run with the top.

(*Mr. Ratcliffe Ellis.*) You do not anticipate any objection to that?

25396. (*Mr. Wm. Abraham.*) No. The point is the timber is sent down as it is without being made, and the man has to make it as best he can at the place. The suggestion is that a number of these lids should be prepared on the surface, and the man select the best he can, and trim it to his requirements. That is what you mean?—Yes.

25397. (*Mr. Ratcliffe Ellis.*) That is with reference to the supply of the timber?—Yes.

25398. Then you speak as to the drawing of the timber?—Yes.

25399. What is your suggestion about that?—I would suggest that Silvester's method of drawing timber is a very good one. In nearly every case in the seams of South Wales they have to be timbered, and when the road gets too low they have to be taken out to allow of the passage of the traffic, that is, the horses and so on. I think that if these men were compelled to use these appliances in drawing out this timber after they had been partly loosed, it would be a source of safety to them.

25400. You think that the timber should not be taken out by knocking it from under with a hammer, but that there should be an appliance like a lock and chain, by which you could get the prop out without getting underneath the place?—Yes.

25401. Is that in use in your district?—Not generally.

25402. Do you thing that should be made compulsory?—Yes.

25403. Have you anything to suggest about who should draw the timber? Who draws the timber now?—The timber-man, the man in charge of the job. A section of the work he is told off to repair, and I think that man should do it, or sometimes he could have assistance from his mate, as we call him down there.

Digitized by Google

25404. Do you think that there should be a special man appointed to draw the timber?—The timber-man now employed could do it. He does it now, often.

25405. With reference to the hours of the colliery examiners, what are the hours now?—Twelve, generally, in the mine.

25406. Do you think that is too long?—Yes.

25407. During the time that you are in the mine can you do the whole of the work that you have to do? Can you make a proper examination of your district in the 12 hours?—Yes.

25408. Do you think it is too long?—Yes.

25409. What length of time do you think would be proper?—Eight hours.

25410. What colliery do you work at?—Vivian Colliery, Abertillery, Monmouthshire.

25411. Is that a large colliery?—Yes.

25412. How many examiners are there there?—Ten.

25413. How many deputies?—Two.

25414. Do they work one or two shifts?—Two—one on the coal, and a repairing shift.

25415. Do you think the hours should be reduced to 8, and do you think that you could make a more complete examination in that time?—I think that if there were three shifts of examiners it would materially affect the safety of the mine.

25416. As to shot-firing, have you shot-firing at your colliery now?—Yes.

25417. Do you fire between shifts?—Yes.

25418. Do you use safety lamps?—Yes.

25419. How do you fire, electrically or with a fuse?—Electrically.

25420. Do you fire now between shifts?—Yes.

25421. It is not general. Do you fire in the repairing shift?—No. Our colliery commences work, that is winding coal, at 7 a.m., and they cease at 4.45, and shot-firing commences at 5.40, and the men are supposed to be clear then—all men except those employed as shot-firers and examiners.

25422. Do you recommend that that system should be made general?—I recommend that that should be made general between shifts, but not so soon after the men have finished work.

25423. You would allow an interval between the time the men come up from the working shift before the shot-firers go down?—Yes.

25424. Do you fire in the coal?—We fire in the coal in one seam in the colliery.

25425. Do you recommend that the shot-firing in the coal should be between shifts?—I might say in this one seam, namely, the Elled seam, that the firing goes on during the working shift, but there is an exemption from the mines inspector.

25426. Do you suggest that there should be no shot-firing in the coal except between shifts?—I suggest that the firing should only take place on main roads between shifts.

25427. You would not apply that to the firing in the coal?—No, shot-firing only during shift in exempted seams.

25428. There might be certain seams where even the shot-firing in the coal should not take place except between shifts?—Yes.

25429. You would not make that general?—No.

25430. You would make it general that shot-firing in the roads should be only between shifts?—On the main roadways.

25431. Would you also suggest that there should be no shots fired in the main road except on the direct instructions of the manager?—Yes.

25432. Have you anything more to say about shot-firing?—Only that I should like to have the time increased, that is to say from one hour.

25433. More time given to shot-firing?—Yes.

(*Mr. Wm. Abraham.*) That shot-firing should not be done so soon after the shift is over.

25434. (*Mr. Ratcliffe Ellis.*) That is what he says. You said shot-firing should not begin until some time after the shift is over?—Yes.

25435. What length of time do you suggest?—At least four hours.

25436. How would that work in? How long does the shot-firer take with his work?—Sometimes two hours.

25437. When would the repairing shift go down?—I would suggest for the safety of the mines that there should be a shift of eight hours repairing.

25438. An eight hours' coal-getting shift, shot-firing during the next eight hours, and after that an eight hours' repairing shift?—Yes.

25439. (*Chairman.*) This is with the object of not raising dust in the roadways?—Yes.

25440. (*Mr. Ratcliffe Ellis.*) Now with reference to the Special Rules. What Special Rules do you desire to alter? You mentioned General Rule 4, which is as to the examination before the commencement of each shift. What alteration do you want to make in that?—It says in our Monmouthshire Rules that the examination shall be made with a locked safety lamp, except where gas has not been found within the preceding 12 months. I suggest that in every case the examiner should use the locked safety lamp, and where gas is found frequently that there should be a more sensitive lamp than now in use.

25441. You would suggest that in every mine where gas has been seen at all the examination should be with a locked safety lamp?—Yes.

25442. But you think that the examiner should have a more sensitive lamp?—Yes, in the more fiery mines.

25443. What lamp do you suggest?—It will be hardly fair for me to give my opinion as to the best lamp that is on the market, but Dr. Clowes' hydrogen lamp is a very good lamp.

25444. Examination No. 1 is to be made before the shift?—Yes.

25445. What do you suggest about the examination during the shift?—After the examination has been made before the shift I suggest that there should be another one made again at least during the working shift, and that both should be recorded.

25446. The second one does not need to be recorded?—No, not at present.

25447. You think that they should both be recorded?—Yes.

25448. If there is more than one shift being worked what then? You say that in collieries where there are two shifts working night and day the examiner should be relieved at the end of his eight hours and another examination made by the relieving examiner?—Take the colliery I work in now: the fireman could start at 3.30 a.m., make his examination, and come out and see his men before they entered the mine, and then, I think, he should make another examination and cease work at 11.30, completing a shift of eight hours.

25449. Forget the eight hours for the moment. If there are two shifts, one immediately following the other, would the examination during the first shift do for the examination prior to the beginning of the second shift?—That could be arranged. In our colliery now the night examiner examines for the day shift, and the day examiner examines for the night shift. They both commence at 3.30 in the morning and afternoon.

25450. If your system was adopted, there must be an interval of eight hours between the two working shifts. That could not be done?—In the interval of eight hours the examiner could be in examining the work while the shot-firer fires his shots.

25451. They could examine during the shot-firing shift?—Yes.

25452. That would do for the examination before the second shift of working?—No, he might make an examination at least two and a-half hours before those men came in—that is the repairing shift. That would do. The examination he had made two and a-half hours previous would do for the shift coming in to repair, and the examiner under the repairing shift could make the same examination for the coal shift, if necessary, according to arrangement.

25453. That would be only one shift for coal-getting. You could not have two coal-getting shifts?—No.

25454. With reference to examinations, have you anything more to say about that?—Do you mean the examination in the mines?

Digitized by Google

Mr. John Rees Powell.

27 June 1907

25455. I mean the examination before and during the shift. Have you said all that you wish to say about that? —Yes.

(*Mr. Wm. Abraham.*) I do not think he has finished. Does he not suggest that the relieving examiner should make really the third examination?

(*Mr. Ratcliffe Ellis.*) No.

(*The Witness.*) That is what I meant.

25456. (*Mr. Wm. Abraham.*) There is something in his mind which he has not made clear?—I had better explain.

25457. What time do you go down in the morning to make the first examination?—3.30, generally, in South Wales.

25458. When you have done that, what do you do next? —We come back to report, and then after the men are sent away.

25459. What do you do? Do you examine the lamps of the men?—Yes.

25460. What do you do next?—After the men are sent away to their various working places, we get a list from the pit top saying who is absent, and so on, and, of course, we have to make arrangements to fill up those gaps, and then we have to attend immediately to the places that we might have found unsafe or dangerous during our preceding examination, and make them safe, clear any gas that might be present, and any bad roof or sides get attended to at once. We make it a point to go to those places at once.

25461. What do you mean by clearing any gas?—Diluting any gas we might find.

25462. Do you do that where the men are at work?—If it is not in large quantities. Small quantities can be cleared

25463. Are you in the habit of clearing small quantities of gas from stalls when the men are at work in the district? —Providing that the amount is not very great. If the amount is great we get the men all cleared from the return side of it.

25464. Providing that there is not a great amount of gas, you clear it during the time the men are at work?—Yes, if it is not a very large quantity.

25465. When you have done that, what else do you do during the day?—We examine all the roads and faces and see that timber is sent in, and various other duties besides such as keeping time and looking after things generally.

25466. Looking after the traffic to see that the coal is coming out from your district?—Yes.

25467. Do you do that?—Yes.

25468. Are you called out occasionally from your own duties to attend to help the haulier, or see that the coal is got out properly from the district?—Yes.

25469. When do you, as a rule, make your last examination?—We make our examination in Monmouthshire, generally, at 3.30 p.m. in the afternoon, and that suffices for the night-shift.

25470. Is that the second time that you are examining the faces?—Yes.

25471. After you have examined them the first time before the morning shift, you do not examine again until three o'clock in the afternoon?—Yes, in every case where the examiner goes in preceding the shift they make at least one examination after, before they go out. If they go in at 3.30 in the morning they leave at 3.30 in the afternoon, but in cases where I am employed at present we start at six o'clock in the morning. Of course, the night examiner has made his examination for the day-shift. Then we go about our business, examining the whole of the district that we are engaged in, and then at 3.30 in the afternoon we examine for the night-shift, so really our last examination is most important.

25472. Is it at 3.30 in the afternoon that the day fireman makes his first examination?—No.

25473. You say you take time and then what do you do; We want to know exactly what you mean?—I will explain to you. Take two cases.

25474. The night fireman makes the examination preceding the day-shift?—Yes.

25475. When do you make your first examination?—We start about eight o'clock in the morning, after the men have got to their places, sometimes before then. First of all we remove all these dangers, as I told you, and then we start our examination. We come back then and have our food and start again. We are in the district before 3.30, but we examine minutely from 3.30 to the end of our shift. Now do you understand, Mr. Abraham?

(*Mr. Enoch Edwards.*) He is given two shifts and two separate systems.

25476. (*Mr. Wm. Abraham.*) He did not make it as clear as, I think, he had a right to. You make a thorough examination in the morning from eight to about 12 o'clock, or later. That is your first examination after you have seen everybody at work?—Yes, we are generally engaged from about eight o'clock to 12, and then we come back to our station for refreshment, and after seeing that things are all right, and having refreshment, we next go in our district and start our examination at 3.30 for the night-shift. That is after we have been at work over nine hours. Do you follow me now?

25477. (*Mr. Ratcliffe Ellis.*) With reference to the qualification for the examiners, do you think that they should have certificates?—Yes.

25478. By examination?—Yes.

25479. Would you suggest that a second-class certificate would be satisfactory?—Yes; but I am sorry to say that, perhaps, the supply would not meet the demand of second-class certificates.

25480. If that were arranged, you would let the men occupying the positions now have service certificates. A man who had been examining for so many years would have a service certificate, and a new man would have a second-class certificate?—Yes, or some new certificate instituted.

25481. Do you suggest a different examination from the second-class examination?—Yes, for examiners.

25482. What sort of an examination would it be?—An examination with a knowledge of the Coal Mines Act, and, of course, a knowledge of gas and ventilation and general education.

25483. They do not want much more for the second-class certificate?—They generally do, I think.

25484. You think, at any rate, that there should be some examination conducted by the Home Office to qualify the fireman for that position?—Yes.

25485. With regard to the making of Special Rules, you suggest that there should be an alteration in the present method of making them. You say: "Whenever Special Rules need amending, or instituting, that there be representatives of all classes engaged in the mine on such Board, especially examiners, as they are the persons who are employed to see that the Act is applied in very many instances. They could possibly offer many useful suggestions in the formation of rules." What sort of a Board is this to be?—There was a Board in Monmouthshire some two years ago composed of the mines inspector for the district and the various colliery managers and miners' agents.

25486. It was voluntarily invited to discuss this matter? —Yes.

25487. You suggest that the examiners should be on that Board?—Yes.

25488. Not necessarily miners' agents, but persons occupying the position of examiners?—Yes; as well as other representatives.

25489. I will put to you a difficulty there is about that. Do you suggest that no rule should be proposed except one that was approved by that Board?—In the making of Special Rules, that is, appertaining to collieries, I think every class should be represented on such a Board.

25490. Would you go so far as to say that the owner of a mine should not be entitled to propose a Special Rule unless it was approved by this Board?—It is not now, generally.

25491. Would you go to that extent and say that a man should not be entitled to propose a Special Rule unless it was approved by this Board?—No.

25492. Would this meet your views. Supposing that the owner proposes a rule, as he does now, but before it is established the Home Secretary should give notice, and anybody interested—examiners, workmen, miners' agents, or anyone else—should have an opportunity of objecting to it, and if their objections could not be settled that it should be decided by arbitration?—That would be better, but I do not see what would prevent doing as I suggest here.

25493. I am showing you. Supposing the owner was anxious to propose a rule, he could not do it if the Board said "That rule shall not be proposed." My suggestion is that the men should be entitled to be heard at a later stage before it is established, but that it should be proposed by the owner, if he chooses, without asking anybody. Do you see any objection to that? Of course, before it becomes law all parties should have an opportunity of stating their objections to it?—As I said before, I do not see why you could not adopt the suggestion I have put down.

Digitized by Google

25494. I do not see why you could not adopt mine; that is the difficulty between us. Do you see any difficulty in adopting mine, because I do not propose that the rule should be established until everybody has had an opportunity of discussing it?—I quite follow, but I think, as I suggest, if the men were called in in the framing of those rules, that it would be satisfactory, and that it would entail less cost and trouble in getting them through.

25495. Supposing the men are not to have a veto, what is the use of calling them in?—They could have a veto as well.

25496. I call them in when they could have an opportunity of vetoing and go to arbitration. However, you prefer your own system. You think that mine is better than the state of things at present, but you prefer your own system?—I think that if we adopt what I say, the Rules could be framed better.

25497. (*Chairman.*) Is not your suggestion rather that the men should be consulted at the earliest possible moment with regard to these Rules?—Yes.

25498. When an owner has once put forward a set of Rules that he thinks ought to be established, he has committed himself to those Rules. Is it not your suggestion that before the owner has committed himself at all to these Rules, that he should have a conference with the men, to discuss the matter before he comes to any definite conclusion, even as to whether he would wish to see the Rules established?—That is my view.

25499. (*Mr. Ratcliffe Ellis.*) In that conference are the men to have a right to say "That Rule shall not be proposed," because if they are not to have that right what is the good of a conference?—I do not want to go as far as that.

25500. You suggest that there should be a conference, but if at the conference they did not agree, the owner should still be at liberty to propose his rule?—He could go on.

25501. Do you not think that that would cause more friction? Supposing you had a meeting and did not agree?—I can cite a case when they proposed and formed the last new Special Rules in Monmouthshire, and the Forest of Dean. I think that nearly everybody was represented except the examiners.

25502. That was a voluntary meeting at which they were asked. There was no compulsion put upon the owner to propose a Rule.

(*Mr. Wm. Abraham.*) The result of that was so good that the witness wants to make it compulsory, in order to secure a similar result.

25503. (*Mr. Ratcliffe Ellis.*) I want as much liberty as I can get. My scheme would enable examiners and everybody interested to make an objection and be heard. We need not go further into this matter, but you say you prefer your own scheme?—They were allowed 14 days last time to make objection.

25504. My scheme is different, but you prefer your own?—Yes.

25505. Now with regard to the administration of the Mines Act, you think that everybody should have a copy of the Rules?—Yes.

25506. They can have them now if they apply for them?—It is given them when they start work.

25507. (*Mr. Smillie.*) Officials only—not the individual workers?—Yes, everyone.

25508. (*Mr. Ratcliffe Ellis.*) You say that the workman should be encouraged to ascertain what is contained in the book presented to him. Who is to encourage him?—I state that further down.

25509. Is it the officials?—And the owners, too. In South Wales and Monmouthshire they offer prizes to-day for ambulance efficiency. I think if they put up prizes every year for the workers that there would be a better opportunity for them to know what is in the Book of Rules.

25510. These are for safety. Should he require to have a prize offered him to ascertain what is contained in a book compiled for the purpose of securing his own safety?—Often the men never open the book after they get it.

25511. Do you encourage them to ascertain what is contained in it as examiners?—Yes.

25512. Can you suggest any better encouragement than that which is given by the officials?—Yes, I think it would be a stimulus to them if there was a certificate given, or something.

25513. You think that it would induce them to read the Rules if prizes were offered?—Yes, by the manager or Owner.

25514. Then you say in paragraph 8: "It should also be the aim of all officials to see that the Act is properly carried out." There is no need for an alteration of the law to provide that?—No.

25515. "And frequently inform the men under his charge the requirements, and every workman with a boy under his charge should assist him in acquiring a full knowledge of all appertaining to him to good discipline in the mines"; that is excellent, and everybody agrees with that. "There should, so far as possible, be a mutual understanding between the officials and workmen, and every effort made to respect those in charge, and it should be the duty of each man to see that each boy under his care be not allowed to remain about the main roads at the commencement of the shift, and each person, unless on business, should at once proceed to his working place beyond the zone of all traffic." Excellent again; we quite agree with that. You do not want any legislation in order to secure that?—It is not compulsory.

25516. How would you make it compulsory that the officials and the workmen should have a good understanding, and that each man should be made to do his duty?—I say about this last phrase about the boys on the main road, that I have seen boys about the road after the traffic has commenced.

25517. You would order them away?—Yes.

25518. What more do you want than that?—I should say make it compulsory for them not to go there. I have heard men tell me that it is no business of mine.

25519. They will tell you that whatever the law is?—If I had the law at my back it would be better.

25520. It is your business to see that they are not there, and you send them away now?—Yes, but I am told then it is not my business.

25521. I think you cannot alter that by an Act of Parliament. Then you say that there should be special facilities in every colliery for rescue work, but the Commission has already considered that matter and issued a report upon it. Then you say: 'There should be a central station in each mining district where this knowledge might be obtained." That has been under consideration. "In every colliery ambulance work should be encouraged, and instead of as now stated in General Rule 34, where it states that ambulances or stretchers, with splints and bandages shall be kept at the mine in case of accidents, it should state that they be kept in each district, and such other things as may be necessary for use in the case of accidents. You want them to be kept somewhere near where they are wanted?—Yes, in the district.

25522. The chest of the deputy or examiner has been suggested. Would that be a suitable place to keep them?—Yes, or the lamp station.

25523. Is there anything else you wish to add about that?—No, I do not think so.

25524. (*Mr. Wm. Abraham.*) What are the hours generally worked in the district of the Association of which you are Secretary?—With very few exceptions, one or two collieries, the examiners work 12 hours.

25525. 12 hours at the pit, or 12 hours in all?—12 hours at the pit, down the pit often.

25526. Is there something else they have to do when they come up from the pit?—Yes, I have heard in some places that they have to do duties that they should not.

25527. You are here now representing the Association?—Yes.

25528. You have special ways of knowing what is the rule and practice at the collieries in the Association?—Yes.

25529. Will you kindly tell us what are the hours generally worked in the district?—They work 12 hours down the pit, and after having made their report they have to consult with their superior officials as to the general state of the roads, and so on.

25530. What kind of a report?—A verbal report.

25531. Again, what time would you add to the 12 hours, another hour or 1½ hours, to be the general hours worked by the examiners in this district?—About 12½ hours, until they are relieved.

25532. Do you consider that too many?—Yes.

25533. You consider it too many by a great number?

Digitized by Google

Mr. John Rees Powell.

27 June 1907

(*Mr. Ratcliffe Ellis.*) He says eight hours.

(*Witness.*) I suggest that it is too great by a third of the time.

25534. (*Mr. Wm. Abraham.*) Have you any recommendation to make as to improving the examinations in your district?—Yes, I think the examination should be made with a more sensitive lamp than we have at present.

25535. What about the number of examinations made?—I should say two at least in eight hours.

25536. Two in addition to the one preceding the shift, or two including that one?—I should have three sets of examiners in every colliery, that is, one starting, we will suggest, two and a half hours before the commencement of the shift. That is, the pit is open at 6 o'clock in the morning for general work and for lowering persons, and coal winding commences at 7 a.m. There should be an examination made before each shift commences—say the first at 3.30 a.m., and another one at least after the coal shift commences up to 11.30 a.m.; then be relieved in the district, by another examiner coming in fresh. He should make an examination then, and another up to 7.30 p.m.; then he also to be relieved in the district, and another examiner start at once to examine and make an examination then, and also another before he is relieved, say 3.30 next morning, and all examinations recorded, and by this method there would be an examiner always in the mine.

25537. What system is there in the district for keeping the roads clear of coal falling from the trams, and rubbish, and so forth?—When coal falls off the trams it is cleared away.

25538. How often are the roads cleaned?—In every shift where I am engaged—every repairing shift.

25539. Have you any dust accumulating?—Yes.

25540. How often is the dust cleared?—Every night.

25541. Are all the roads in the district where you are working kept clear of dust and rubbish and everything? There is nothing to prevent anybody passing trams?—No. Of course these smaller particles go to the top and on the timber, and so on.

25542. Dust on the timber would not prevent any man passing the trams?—No.

25543. Have you any other improvement to suggest, with the exception of shortening the hours of the examiners and a third examination being made?—Yes, I think his duty should be confined to examining.

25544. What does he do now in addition to examining?—He examines, and he keeps the time of every man and boy in his district. He sees that there is a supply of timber sent in to the workings, and he has to see that everything is kept in repair, and in very many cases he has to superintend and look after the traffic; he has to put up brattice-sheets for the ventilation in the district he is in, and supposing he comes across a door damaged, it would be his duty to assist in repairing that door, so that the ventilation could go on its proper course.

25545. Looking after the ventilation would be a part of the examiner's duty?—Yes.

25546. Is the examiner called out to do something else that prevents him from giving proper attention to the necessary examinations in his district?—Yes, he is called out to the traffic often.

25547. In your opinion his duty should be confined to that of a fireman only?—Yes, and of course I mean now the examination to include his looking after the timber to see that it is properly set, and everything else appertaining to safety.

25548. That is part of his examination in the district?—Yes.

25549. You object to his being called out of the district to attend to other things which are not the duties of an examiner?—That is so.

25550. (*Mr. F. L. Davis.*) The hours in Monmouthshire are 12?—Yes.

25551. Is that so in every case, do you know?—In every case in Monmouthshire. I know some collieries in Monmouthshire where they work more. That is on one shift, only they change alternately from 14 hours one week to 10 hours the next week.

25552. So far as you know that is about the time?—Twelve hours is universal.

25553. Do you happen to know whether the hours are longer in Monmouthshire than Glamorganshire?—I think they are similar in Monmouthshire and Glamorganshire. That is generally so, but there are exceptions.

25554. I think you said that generally speaking you consider the districts were too large?—Yes, in very many cases.

25555. At the present time?—Yes.

25556. Is your district too large?—No, not under present conditions.

25557. I mean where you are working now?—No.

25558. Do you know of any cases where the firemen have complained to the manager of the district being too large, and the management have curtailed it and met them?—Yes I know some cases where they have been applied to and the manager has met them; and I can cite names on oath, if they are wanted, where they have been asked and it is not conceded yet.

25559. There have been cases where it has been brought to the manager's notice and it has been altered?—Yes, in my own case.

25560. You say here that you want two examinations, one before the shift?—As now.

25561. And one after the shift, but a record made of it?—Yes.

25562. It is a fact that at the present time there are two examinations made, but only one is recorded?—Yes.

25563. You want both to be recorded?—Yes.

25564. With regard to the question of ambulance and stretchers and all appliances for first aid, the last witness said he thought that they ought to be kept not at the top of the pit, but somewhere in the pit, and he suggested in the fireman's chest. When you have finished your work where do you have your food—where do you keep your food?—At the entrance to the district.

25565. How far would that be from the working face on an average?—Over a quarter of a mile.

25566. Do you agree with that suggestion, that these bandages and stretchers should be kept there?—Yes, they would be better there than at the top of the pit.

25567. They could be kept free from dust?—Yes, in a box.

25568. To be able to be used at once if necessary?—I might say this: I have taken a general interest in ambulance work myself, and I have bandages in a box now for my own individual use, but I think that ought to be universally provided.

25569. Mr. Abraham asked you about the cleaning of the roads. If there is any accident to a journey of trams, and a lot of coal is turned out on to the road, that is cleared up as soon as possible?—Yes, the traffic is generally impeded. It has got to be cleared to allow the trams to pass.

25570. It is to your interest and the interest of the management that the road should be kept clear?—Yes.

25571. So as to make the traffic coming out as smooth as possible?—Yes.

25572. Can you tell us what would be the average wage of a fireman in Monmouthshire?—Yes, £2 10s. per week.

25573. £10 per month?—Yes.

25574. (*Mr. Enoch Edwards.*) Do they pay them monthly?—Weekly, I get paid.

25575. (*Mr. F. L. Davis.*) I think they all pay weekly?—No, fortnightly in many collieries.

25576. (*Mr. Smillie.*) They reckon their wages by the day?—Yes, 8s. 4d. a day.

25577. That is with the percentage on?—That is the standard.

25578. (*Mr. F. L. Davis.*) Our firemen are paid a standard wage, without any reference to the percentage?—The only reference that applies in our case is this: When the Conciliation Board award 55 per cent. we get 2s. 6d. a week advance on that £2 10s.

25579. It has to get to a very high point before you get anything?—Yes. At 60 per cent. we get another 2s. 6d. a week.

25580. (*Mr. Smillie.*) When miners' wages are coming down, how is it then? 8s. 4d. is the present standard. When they go up to 55 per cent. above the standard you get 2s. 6d. When they come down where do you lose? We do not go below the £2 10s.

25581. You do not go below the 8s. 4d. per shift?—No.

25582. (*Mr. Enoch Edwards.*) I understood you to say that your collieries mostly commence drawing at seven o'clock the morning?—Yes.

Digitized by Google

25583. What time do the men go down ?—The pit opens at six.

25584. How long does it take to let them down ?—An hour generally is taken up in putting men down.

25585. The men have to be there at six o'clock in the morning ?—Yes.

25586. They commence to come out at 4.45 ?—Yes.

25587. Does it take them the same time to come out ?—In the morning the pit is not engaged the whole hour. The men do not come in very fast until 6.30. I know that the men can be put down in a little over half-an-hour. If they came to allow the engine driver to go on continuously they could.

25588. If they came at 6.30 they would be down by seven o'clock ?—Yes, or thereabout.

25589. And continues drawing coal till 4.45 ?—Yes.

25590. If they draw them out at the same rate they would be all out by a quarter past five ?—Yes, if the men came continuously, which they generally do at night.

25591. Quarter past five to half past five ?—Yes.

25592. How many hours do you call that a day ?—That is ten hours per day from Monday, but on Saturday they finish at 2 p.m., and Mondays at 3 p.m.

25593. You say you have long days and short days. You say if the men were all there they would commence at half-past six, and that you could let them down in half-an-hour. Assume you work from 6.30 and get them all out at a quarter past five, what do you call those hours ?—Ten and three-quarters.

(*Mr. F. L. Davis.*) They do not begin working till seven o'clock.

25594. (*Mr. Enoch Edwards.*) Have you any boys working under 16 in the pit ?—Yes, we have boys between 13 and 18 working in some of the seams, and they must be 18 before they are allowed in the thicker seams.

25595. Is it ever suggested you cannot keep them more than 10 hours in one day ?—The boys are sent out at the end of 10 hours, or before 10 hours. If I see a boy in late, I generally order him out at once, and out he goes, too.

25596. Do you take care that he goes down last in the morning ?—Yes.

25597. I was wondering what the regulation was, because it seems to me possibly boys may be in the pit infringing the 10 hours a day ?—Generally in Monmouthshire they are very strict about the hours of the boys.

25598. I put it to you if these are the hours as you suggest, it is a reasonable assumption that they go from a quarter past six to a quarter past five in the afternoon ?—The boys, you mean ?

25599. In the pits, the men and the boys ?—Yes.

25600. If an effort was not made, a boy might go in at a quarter past six and come out at a quarter past five ?—He has to be up by then.

25601. If he stays that length of time he is over 10 hours ?—Yes, and he is liable then to be brought up before the management for not acting in compliance with the Act.

25602. You mean that the management is liable to be brought up ?—Yes, and the man who employs the boy, if he does not let him go.

25603. I understand the society you represent consider that eight hours a day is long enough ?—Yes.

25604. You are great believers in the Miners Eight Hours Bill ?—Yes.

25605. Mr. Abraham asked you about the question of dealing with gas. You said if gas was discovered during the working shift, if not great, you diluted it ?—Yes.

25606. What do you mean by "diluted it" ?—Mix pure air with it to make it harmless. You clear it, broadly speaking.

25607. You said if it was not great. How do you measure it ?—Our experience will tell us as to the quantity. Suppose there was a little cavity and a little gas in that, we would have to report that, but it is possible to dilute that in a very few yards from the point of issue.

25608. You said if there is a small quantity you get it out ?—Yes, by erecting a piece of brattice, or something.

25609. You have no special means of measuring the amount of it ?—No, our lamp would not register that.

25610. Examiners are aware that a very small quantity of gas would be more mischievous where you have pure ventilation ?—Yes; I think they are generally aware of that.

25611. Would that be reported in the report book ?—Yes. All gas found has to be reported.

25612. You were asked a question as to your particular districts. What would be the area of your district that you cover in these 12 hours—how many miles do you have to walk ?—I do not know about miles, but the number of working places is between 40 and 50.

25613. When you said you go down to make your first examination at 3.30, and that you finished at a certain time, how long does it take you to get round the first examination ?—From two to two and a half hours.

25614. Of course you are going along leisurely, inspecting and examining ?—Yes—not very leisurely though.

25615. You would not get round if you did ?—In some districts they are very far in.

25618. Would you travel two miles an hour ?—No, hardly that.

25619. You would not do two miles an hour ?—No.

25620. Is that what you mean by going leisurely ?—Yes.

25621. Do you give yourself time to examine the roof and sides ?—Yes. We could not do two miles an hour very leisurely underground, very often in a crouching position. In a seam a yard or four feet high you could not go very leisurely.

25622. Is the examination very laborious work ?—It is very tedious work.

25623. It is too tedious to continue it for 12 hours ?—Yes. The sight must become dim long before 12 hours have elapsed, and the man's brain is not so alert as it should be or could be otherwise.

25624. I observe that you think that the fireman or examiner in your position should hold some certificate of competency ?—Yes.

25625. Not necessarily the same examination as a second-class certificate ?—No.

25626. Ordinarily throughout the country you find that a manager has a higher technical knowledge, as he must have in these days; but the second class is somewhat easy, the examination is not so stiff; but still it is of a practical kind, and for the fireman you want a practical application of his experience and observation ?—Yes.

25627. You would create a new class of certificate ?—Yes, and they should have the preference. I do not believe myself that any man should be engaged after a certain time unless he holds a certificate of this kind.

25628. What class of men are the firemen in Monmouthshire usually selected from—the roadmen, or haulers, or timbermen ?—Colliers and timbermen generally.

25629. Of what age do they select them ?—From about 24 on. I commenced as an examiner at 24.

25630. What were you prior to that; were you cutting coal ?—I was cutting coal, and I had been a timberman as well for a few years.

25631. Do these firemen's wages represent the average wage of a collier ? Are you still paid as the collier, or better paid ?—I think it is a very fair comparison with the wages they are paid to-day.

25632. Do you get full time if the pit is off work ?—We get full time when the pit is not at work, because we have to be at the pit.

25633. You are paid a fixed weekly wage ?—Yes, 8s. 4d. per shift.

25634. If your pits were reduced to three days a week they would continue to pay the examiners for six days ?—Yes.

25635. (*Mr. Smillie.*) What is the time fixed by the Special Rule in Monmouthshire that the examination must be made before the men start work ?—Two and a-half hours.

25636. Are the coal-getters bound to be in at the working face at six o'clock in the morning ?—No, they start to go down at six o'clock. The pit is open to allow persons to descend after six o'clock.

25637. Are they bound to be in at seven o'clock in the morning ?—Yes.

25638. Not before that ?—No.

25639. Therefore the examination of your first working place that you reach in the morning might be three and

Digitized by Google

Mr. John Rees Powell.

27 June 1907

a-half hours before the workman reaches that working place?—Yes, it might be.

25640. I understand that in Wales generally you have what is known as sudden outbursts of gas?—Yes.

25641. And a very considerable accumulation of gas might take place within that three and a-half hours?—Yes.

25642. Some other danger, unseen by the examiner in his round, might be there when the workman goes in in the morning?—A place can suddenly squeeze.

25643. The longer period that elapses before the examiner makes the examination and the men going in, the more danger there is of a thing of that kind?—Yes.

25644. If the examiners' districts were less than they are now he would nor require to start such a long time before the workmen?—No, it could be reduced, perhaps, to two hours or less.

25645. The reason the examination must start at half-past three at the present time is to enable the examiner to cover his district and get out to his point to see the workmen?—Yes.

25646. Your working there is longwall?—Yes, all longwall where I am. It is generally in South Wales.

25647. Does the examiner, from the time he leaves his station and reaches the first working place, go along and make his examination along the working faces only?—No, he has to examine all the roadways as well as face.

25648. As a matter of fact, does he traverse all the roadways out and in which men may have to travel or traffic may have to go on?—He must do that according to rule.

25649. It is not exactly what he must do according to rule; I want to know what he does exactly according to the size of his district. You have fifty working places?—Yes, 48 I have now.

25650. What is the width of them, 17 yards?—Thirteen yards.

25651. Does that include the road head?—That is the working place.

25652. The full working place is 13 yards?—Yes.

25653. You have 48 times that width to traverse in a straight line?—Yes.

25654. Providing they are in a straight line?—They are blocked sometimes.

25655. The probability is that there will be 48 roads leading into those 48 places?—Yes.

25656. The examiner's duty really would be to come out and go in the next road in all those 48 places?—Yes.

25657. If he came out No. 1 roadway and went in No. 2 roadway he would require to come up the full length of that working face?—Yes.

25658. Go down the working face, come back again, come down that road and in that road?—Yes.

25659. Is that usually done?—Yes.

25660. That can be accomplished in a careful examination made in two and a-half hours?—Yes, I should think so.

25661. I suppose in your examination the place in which you must really take the greatest care is the road head—what is called the road head, where the miner fills his tubs?—Yes.

25662. Is there any ripping done? Is your work sufficiently high to make it unnecessary to do ripping of the roads?—We rip in some seams and cut bottom in the others.

25663. You do top ripping?—Yes.

25664. The most dangerous part, as far as gas is concerned, is at the end of the ripping?—Yes.

25665. That requires to be carefully examined?—Yes.

25666. You did not make it clear whether or not your lads generally did get out at the end of 10 hours. Mr. Edwards put that to you. As far as you are concerned, if you find them in the mine at the end of 10 hours you order them out?—Yes.

25667. Do you mean if you find them at the working face?—Yes.

25668. How far might that be from the pit bottom?—In our case it is half a mile.

25669. Would you order a lad a little past 13 to leave the working place by himself and proceed to the pit bottom?—I always tell the butty if there is a young lad like that to go with him. I appeal to his common sense to comply with the Act, and see that the boy is taken safely to the pit bottom, and that the man should accompany him.

25670. Do you always find that the South Wales miner whom you appeal to has common sense?—Yes, I think so.

25671. Sufficient common-sense?—It is only in a few cases we have to complain about those lads being in.

25672. Does not this mean in every case where a lad is working with a grown-up person at the coal face that the grown-up person as well as that lad must be out of the pit within 10 hours?—They have to be out by 5.40, to allow shot-firing to commence. There is a Special Rule at our place.

25673. That is far more than 10 hours?—Yes, they work 10 hours, as a rule, coal getting, but they have until 5.40 to get out of the pit.

25674. (*Mr. Wm. Abraham.*) Did you say work 10 hours at coal getting?—That is on four days of the week, and then they work seven hours on Saturday and eight on Monday.

25675. (*Mr. Smillie.*) You know that the lads shall not be underground more than 10 hours?—Yes.

25676. Is it not a fact that some of your lads are not out of your pit within the 10 hours?—In very few cases. I have had cases in my experience as an examiner where I have had to reprimand men for not sending them out, and they have had to appear before the management.

25677. What is the proportion of lads under 16 to 100 men in your colliery. Is it 10 per cent?—I should say it is a little more.

25678. Are those lads engaged chiefly at the coal face?—Yes, with the men getting coal and filling the tubs.

25679. Almost invariably those lads are out within 10 hours?—Yes.

25680. It means that the man with whom they are working must also be out within the 10 hours. Is that so?—Yes. Supposing you and I were working together in adjoining places, if you had a lad working with you and I had a lad working with me, perhaps I could not leave my place immediately, but I would send my boy with you.

25681. That would be all right if one man took two or three lads. Is that the method by which it is secured?—Yes, very often the man goes with the boy. They generally get enough work within the 10 hours, and they are generally gone. There are a few cases where we have had to complain.

25682. You complain that the lads are not amenable to discipline. How often have you found them on the road where they should not be and ordered them to go to their working face?—That is in the morning.

25683. Sometimes their father, or the men with whom they may be employed, tell you that you have no business with that?—I have had that told me before now.

25684. That is not generally so?—No.

25685. Some person says that to you?—Yes.

25686. Do you think that the officials should have some power to enforce their position in a case of that kind?—Yes.

(*Mr. Ratcliffe Ellis.*) You have a Special Rule by which a person is liable to be brought before the magistrates.

25687. (*Mr. Smillie.*) They are really under your orders at the present time?—Yes; there is nothing in the rules stating to that effect.

25688. You are an official of the mine, really?—Yes.

25689. The lads and the workmen from your district in the meantime are under your charge?—Yes.

25690. And they should be amenable to your orders, really?—Yes, that is it.

25691. You find sometimes that they are not amenable to your orders, and some impertinent person will say you have no business?—Not myself only. Of course I have heard this mentioned many times to my colleagues.

25692. They seem to feel that the deputies have no right to order them away?—Yes.

25693. You think that interferes, to some extent, with the discipline of the mine?—Yes.

25694. Have you any foreign workmen employed in the mines in Monmouthshire, so far as you know?—No.

25695. Do you think that the discipline of the mine in which you are employed would be better carried out if the

Digitized by Google

workmen at the coalface did not understand the English or the Welsh language ?—In Monmouthshire there are not many Welshmen engaged.

25696. They are mostly English ?—Yes.

25697. English-speaking ?—English-speaking Welshmen, as you might term them.

25698. Supposing 100 men in the 48 places you have under your charge did not understand English or Welsh and you did not understand pigeon Russian, or whatever they speak, and Russians were employed, do your think that would tend to safety and discipline in the mine ?—No, I do not.

25699. Supposing a workman you advised in the morning as to the condition of the place could not understand you, do you think that that district would be considerably safer than it is at the present time ?—No, it would not be so safe.

25700. It would not be so safe ?—If a man could not understand what I told him I do not think it would be as safe.

25701. I am putting the question to you not from the point of view of your district, because you have not many foreigners, but it has been said that foreign workmen, who do not understand the language, are more amenable to discipline than our own British workmen. I want to have your opinion.

(*Mr. Ratcliffe Ellis.*) More amenable than the Scotch.

25702. (*Mr. Smillie.*) I find some of the Welsh people are not amenable, because they have refused to accept the advice of our friend. Who do you think should be most concerned—I am asking you this as a miner of long experience—in the drafting of Special Rules for the safety of the men underground. Should not the workmen whose lives are at stake be chiefly concerned in the drafting of Special Rules for the safety of the men underground ?—They should be on that Board.

25703. And next to them probably the examiners who have to carry out those Special Rules and look after the safety of the men ?—Yes.

25704. May I take it, in your opinion, and in the opinion of the firemen of Monmouthshire and South Wales, that the firemen from the safety point of view are the most important class of workmen ?—Yes.

25705. You think even to a greater extent than the manager who may not visit the mine more than once a day or once a week. You think that the firemen are more important even than the manager, so far as safety is concerned ?—I think they hold the most important position underground.

25706. Do you think, so far as the safety of the workmen at the face is concerned, that they should be consulted in the drafting of the Special Rules ?—Yes.

25707. And that the firemen also should be consulted ?—Yes.

25708. If Mr. Ellis is correct that his proposal is the best, that the employer should, in the first place, initiate or propose rules to go before the Home Office to which the workmen or any person could object and ultimately go to arbitration—if that were admitted would the workmen not have as good a right to initiate and propose rules to the Home Office without the employer having the right to object ?—Yes, the workmen should have every facility, and every other branch, to oppose any rule that they did not think well enough of.

25709. There are three methods with regard to these Special Rules. There is the method suggested by you, that the employer, the mines inspector, and the workmen, through their representatives, and the deputies should jointly hold a conference and come to some special safety rules.

(*Mr. Ratcliffe Ellis.*) Try to.

25710. (*Mr. Smillie.*) Yes, endeavour to come to what, in their opinion, was the best rule for safety. If they failed then some other rule would have to be made. Another method is for the employer, after having fully inquired into the matter, to propose rules and send them to the Home Office, and if the Home Office approves they could be sent back and anyone would have a right to object. The third method is the workmen, whose lives are concerned, should initiate and propose rules, send them to the Home Office, and the employer could object. These are the three methods. Your idea is that a joint conference in the first place, would be the best method ?—Yes, it would save a lot of delay.

25711. Do you think, if Special Rules were adopted by a joint conference, that they would be more likely to be observed and carried out than if forced practically upon the workmen against their will ?—Yes.

25712. Do you think it would be an advantage if the lads attending public schools in South Wales had some instruction on mining, and the nature of gases, and the danger by which the lives of miners were attended underground ?—Yes.

25713. The probability is that 80 or 90 per cent. of the lads attending the schools in the mining districts will become miners ?—Yes.

25714. Do you think it would be an advantage if the lads had some training as to the dangers with which they would be surrounded in the mines ?—I may tell you in Glamorganshire that course is adopted, but it is not universal.

25715. Do you think that that would be an advantage to the lads ?—I should make it universal in every mining district.

25716. Do you think it would tend to greater safety and discipline underground ?—Yes.

25717. If they had some knowledge of the dangers by which they would be surrounded ?—Yes.

25718. (*Mr. Ratcliffe Ellis.*) You would make it obligatory. Is that on the parents of the boys ?—It is down in the code in Glamorganshire.

25719. You would have it part of the code in public elementary schools ?—Yes, in every mining district, I should think.

25720. (*Chairman.*) You have in your mine 10 examiners and two deputies. I thought you explained that a deputy was merely a person who took a fireman's duty when the fireman was away, but you seem to have two permanent deputies. What do those do ?—Those deputies I mentioned here work a part of the shift and help, as it were, in the morning. We call them deputies. It is another name for assistant firemen.

25721. They only do part of the work you do, and I suppose they do not get the same pay ?—No, to make it clear, the reason that plan is adopted is this. I mentioned some time back that there was one seam in our colliery where they do do shot firing in the shift, only being a damp seam they have had an exemption from the inspector. There is no shot-firing at night, and, of course, the one examiner can proceed with his work much quicker. They have two men engaged in this seam all day and one at night as an examiner, and then this man coming in the morning to assist him on his last examination.

25722. One examiner has an assistant with him ?—Yes, in the morning.

25723. To help him do his work ?—Yes, and to report for himself.

(*Mr. Ratcliffe Ellis.*) Shall I ask Mr. Evans if he agrees with the evidence of this gentleman. I notice there is one thing he says in his statement, that is that the men should be required to buy their explosives from the owner. That is the only addition he has to make to the witness's evidence

(*Chairman.*) Would you like to make a statement, Mr Evans ?

(*Mr. Evans.*) Yes, my lord.

Mr. JOHN HENRY EVANS, called and examined.

STATEMENT OF WITNESS.

Mr. John Henry Evans

25724. (1) Discipline within recent years has been much better, but the recklessness of many of the workmen in disregarding the rules, and in some cases the laxity of officials in enforcing them, and their disregarding also of them is the direct cause of many preventable accidents.

(2) The long hours worked by the colliery examiner which in the majority of cases are 12, are such that they cannot supervise so keenly the last few hours of the working shift, therefore, discipline is not so good, and I believe great assistance would be given if the representatives of the workmen impressed upon them that it is part of their duty to obey instructions given

Digitized by Google

Mr. John Henry Evans

27 June 1907.

and assist in keeping good discipline. Something should be done to prove that men are practical workmen, when they apply for employment in different branches.

(3) Colliers should do all the propping and timbering of their working places, sooner. Propping should be done immediately after the roof is exposed, and more attention should be given by the workmen to better and proper packing which can best be enforced, if necessary, by frequent visits to a workman's place by the official in charge.

(4) Workmen's inspection according to General Rule 38 has done a great deal of good in satisfying the workmen as to the safe condition of the mine, and is carried out in the majority of collieries.

(5) Shot-firing in my opinion ought to be prohibited during the working shift. It should be permitted only where coal shots have to be during the shift, and that under special condition. All shots should be fired between shifts by a man specially appointed. I think it should be made compulsory on the men to get their explosive from the owner.

25724A. (*Witness.*) I am examiner at Lewis Merthyr Colliery and represent the Monmouthshire and South Wales Colliery Examiners' Association. There are two or three suggestions which I do not think my friend Mr. Powell has made quite clear to you. The last one particularly is this one, the question of the assistant. One thing we condemn in South Wales very strongly is that this man, that is, the assistant fireman, does not accompany the fireman, but he does a part of the district of the fireman, which is too large for the fireman to do within the time allotted. They have made inspection previous to the shift. There is a supervision of all these places where the man has inspected in the morning and the fireman has to take charge of those men, and part of the district that he has not inspected. This we say is very wrong. We suggest that every man that makes the inspection previous to the shift should be responsible for the men working in that particular district during the shift of working.

25725. (*Mr. Ratcliffe Ellis.*) The man who makes the inspection before the men go to work should make the necessary inspections, whatever they may be, during the time the men are at work?—And supervise the men.

25726. That would make a very long day?—No; in the majority of cases in South Wales there are too many places allotted to one fireman or deputy to make the inspection according to the Act; therefore, he must get a deputy to inspect his places.

25727. In point of time, whatever size the district is, he must be down two and a-half hours before the men, and if he stops down all the time the men are down, if the men are down 12 hours it would give him about 14 hours?—This is the point I want to be quite clear upon. I have to be responsible for the safety of those men during a part of the shift when I have not inspected their places.

25728. Supposing you relieve the first man and come on the second fireman?—We ought to get our district so allotted that we could make the inspection ourselves. I should not be able to make the inspection.

25729. That means that the district should be reduced in size?

(*Mr. Smillie.*) Supposing he has 70 places he can only make his morning examination for 50, and another person has to make it for the other 20. Immediately after that examination the whole 70 are under the fireman.

25730. (*Mr. Ratcliffe Ellis.*) It comes to this, the district is too large?—That is the point.

25731. (*Chairman.*) You object to this system of deputies altogether?—Yes.

25732. You would have everybody full examiners?—I object to the system of deputies.

25733. (*Mr. Ratcliffe Ellis.*) The district is too large for one man to look after?—Yes.

25734. Is there anything else in Mr. Powell's evidence which you do not agree with?—I wish to say something else.

25735. (*Chairman.*) On the matter of deputies, do you speak on behalf of the Association?—We are speaking on behalf of the Association.

25736. Mr. Powell and you. Mr. Powell does not object to this system of permanent deputies, but you do?—Yes.

25737. Which of you represents the Association?

(*Mr. Powell.*) I was not asked that, my Lord.

(*Chairman.*) I understood that if you had objected to the system of deputies you would have said so. I may take it you both agree as to that?

(*Mr. Powell.*) Yes.

(*Witness.*) There is another point in connection with the hours worked. During the hours worked by the colliery examiners we think, and we practically know, that we are not doing justice. We know that we are not doing what we would like to do for the safety of the men.

25738. (*Mr. Ratcliffe Ellis.*) You think that they ought to be reduced. Both physically and mentally they are too great a strain on a man to do his work satisfactorily. You think that they should be reduced to 8 hours?—Yes.

25739. That is your view, and Mr. Powell has said that too?—Yes, that is my view.

25740. Have you anything to say with regard to the question of timbering? In your statement you say colliers should do all the propping and timbering of their working places sooner, and that propping should be done immediately after the roof is exposed, and more attention should be given by the workmen to better and proper packing, which can best be enforced, if necessary, by frequent visits to a workman's place by the official in charge, that is to say, the colliers ought to do their propping sooner, and not wait till the roof comes down?—According to the rule of South Wales there is a uniform system of timbering at the coal face, but inasmuch as only one examination is required, and only one can be done by the time allotted, the possibility is that the worker risks it and does not put it up at the stipulated time when it is exposed.

25741. The collier is apt to be negligent, and wants more inspection?—A keener inspection.

25742. A reduction of the districts would bring that about?—A keener inspection.

25743. Then you say that workmen's inspection, according to General Rule 38, has done a great deal of good in satisfying the workmen as to the safe condition of the mine, and is carried out in the majority of collieries?—Yes.

25744. Have you anything to suggest by way of altering that?—Yes, I would suggest that some pressure should be put in some way or other and get the workmen to do this in some collieries; I am sorry to say it is done only once in every six or twelve months.

25745. What pressure do you suggest should be brought on the workmen to do it?—I think there should be something in the Special Rules almost compelling them to do it once every three months.

25746. It the workmen do not do it now, do you think that they would do it any more if there was something in the Special Rules?—I believe if there is something in the Special Rules that when the inspection was done by the men—the difficulty is this, that the men have to pay themselves for inspecting—if there was something done by the State or some other source to pay a part of these men's wages, undoubtedly, it would be done oftener.

25747. Do you think the difficulty now about making these inspections is because there is no fund to pay the men?—It is adding the cost on to the men.

25748. Do you think that is an objection?—To some extent it is.

25749. To what extent—is it a large extent?—It is in this way: in large collieries, undoubtedly, it would be a great expense to do it according to the Mines Act once every month, and the men are not in many cases paid at the high standard of wages for doing that work.

25750. They are not paid adequately for doing it?—No.

25751. Do you think their not doing it arises from fear of the consequences?—Yes. Perhaps so.

25752. Have you known where reprisals have been made because a man had made an inspection and made a bad report?—I hardly think it is fair.

25753. Have you known such cases?—Yes, indirectly undoubtedly, it has been done.

25754. Very indirectly?—Yes.

25755. (*Chairman.*) Do you mean by "indirectly" that a man has been sent away and you cannot trace his being sent away to his report?—It is in this way not direct: you dare not do it direct, but undoubtedly, in my opinion, cases have happened.

25756. People have been mysteriously given notice that their services are not required any more?—No. It is a question, I think, I should hardly answer.

Digitized by Google

25757. (*Mr. Ratcliffe Ellis.*) You do not feel that you ought to give any information as to where this has happened or the extent you would go. You think there have been cases where the men have suffered in consequence of making a bad report. Is this examination usually made by the workmen in the mine?—Yes. Perhaps so.

25758. Do you think that is desirable?—Yes.

25759. They know more about it than anybody else?—Yes.

25760. You would not give the right to make the inspection to any other persons than those employed in the mine?—No, certainly not. I believe the inspection ought to be done by the men in the mine.

(*Chairman.*) At present, the men, if they choose, can appoint a man from another mine.

25761. (*Mr. Ratcliffe Ellis.*) In his view it is not desirable, he says. You think that this inspection is best done by people employed in the mines being inspected?—Yes.

25762. You think it desirable that it should be more used?—Yes.

25763. You think one reason is that the men are not sufficiently paid, and another may be that there is some fear that there might be reprisals if a bad report is made. That is your view?—Yes.

25764. Shot-firing, you agree with the last witness, ought to be done between the shifts?—Yes. There is one point upon which I differ from my friend. I do not agree as to shot-firing in the coal.

25765. You would always have that done between shifts?—I do not believe in shot-firing in the coal at all.

25766. But where it has to be done it would be inconvenient to do it between shifts?—Yes.

25767. You speak rather as to the haulage roads, the main roads?—I do not believe in shot-firing in the coal in dusty and fiery mines, in gaseous mines at all, because they are the greatest danger, in my opinion.

25768. You think the explosives purchased ought to be supplied by the owner, in order to secure proper explosives?—Yes.

25769. Is there any other statement you wish to make to the Commission?—Yes. I should like to say a few words with regard to the hours of working. I believe something should be done with regard to making a second inspection during the working shift compulsory. Again, we have adopted at my collieries working three shifts of firemen, and we have found this system very successful, and we have brought colliery accidents to a minimum.

25770. You only work eight hours. Your firemen only work eight hours?—A continual supervision of eight hours each shift, but our work does not quite finish at the eight hours. Our supervision of the mine is eight hours each, that is in the face and the workings. Any office work, such as booking, we do after leaving the shift.

25771. You have to add half-an-hour on to the eight hours?—Yes, half-an-hour or three-quarters of an hour.

25772. (*Mr. Wm. Abraham.*) I think it is worth while that the Commission should know how these three shifts are worked in practice, so that we may see the effect of it. Will you make a statement as to that?—This is the way we work. According to the Coal Mines Act we are required to go down two and a-half hours previous to the shift. We are down the colliery from 4 to 4.30 in the morning. We make our inspection previous to the shift, and then we are up the shaft about 6. We inspect the lamps till 7. We go down at 7 o'clock and right into the colliery face with the men: we are practically in the coal face supervising the men at the same time as they start. We make an inspection again. After I have made my inspection I am back at 12.30 to 12.45, or a shade after. I am not leaving my district until the fireman comes down at 12.30 or 20 to 1. He comes in to the point of the district and in this case has charge from me and starts to make another inspection. The majority of accidents in our colliery happen in the last few hours of the shift. When the second fireman is coming on he is coming from the top with good eyesight and good hearing, and he is coming into the face to inspect the timber set during the morning, and any mistake he is able to see which a man would not see when he was exhausted, but this man is full of energy. By that system we believe we have brought our accidents down to a minimum point. During the last three years we have only had one fatal accident in the mine and one broken limb.

25773. (*Chairman.*) From falls of roof and sides?—Yes, again at 9 o'clock at night, or 9.30 these men would inspect the day shift previous to the night shift. There would be another man coming down at 9 o'clock at night again.

25774. (*Mr. Wm. Abraham.*) Your great point is this, that a fresh man examines these districts when the men are exhausted?—When the men are exhausted this man comes from the top full of energy and can see any difficulty or danger, and he can see things quicker than men who have been working hard all day. I believe we have reduced the accidents to a minimum point.

25775. You have only had one fatal acoident during the last three years?—Yes.

25776. (*Chairman.*) In your particular mine?—Yes.

25777. How many are employed?—In the particular pit where I am, 1000.

25778. In that pit, 1000?—We have only had one fatal accident in three years and one broken limb.

25779. (*Mr. Wm. Abraham.*) You would advocate that three shifts should be made compulsory in our mines?—Yes.

25780. (*Mr. Smillie.*) You would not require three shifts if no workmen were at the face?—We are talking as the mines are now. I say we require three shifts. Then with regard to the workmen, I think something should be in the Special Rules compelling a workman when applying for employment from one colliery to another to prove that he was a practical workman. If he applied for cutting coal, he would have to prove that he had been a collier cutting coal, or the same with any other branch. I believe, in my opinion, that it would reduce the accidents. The only accident we have had was a man who came in without our knowledge, and not being a collier. He got killed on the third day, and we found out that he had been a labourer before.

25781. (*Mr. Ratcliffe Ellis.*) Would you have any objection to being submitted to a medical examination also?—Well, no; no objection to a medical examination, although it is not always necessary.

25782. You never can tell; supposing he was suffering from nystagmus or something of that kind?

25783. (*Mr. Enoch Edwards.*) I understood you differed from your friend on this interpretation of the deputies. You object to deputies altogether?—Yes.

25784. The term "deputy" has been suggested to us as a sort of assistant fireman?—Yes, the deputy would be an assistant fireman.

25785. How many firemen are there at this colliery, where you employ 1,000 men?—There would be 18.

25786. You are working in eight-hour shifts?—Practically.

25787. In the case of accident to one of you, or illness, which happens to firemen like everyone else, how would the Company carry out the eight hours if there were no deputies?—They would have to substitute someone else.

25788. Who are not firemen?—Exactly like putting a fresh man on. Experience would show the Company that the man was capable of carrying out the duty, and they would substitute that man in the place for the time.

25789. I was putting to you whether you had overlooked that practical difficulty, that a deputy or two about the pit may be in the interests of the men themselves, who are firemen who met with sickness, and also in the interests of the Company, too. The creation of other firemen might not be the best of things for the firemen, but you object to anybody being employed at all above the number?—No, it is in the interests of safety.

25790. Your friend who gave evidence before said that they had ten firemen and two deputies. The deputy does the work over the area the firemen should cover. They are assistants to the firemen. If there are no men about the place there are 18 of you who must, to carry out your eight hours system automatically, depend on John Jones coming on that shift, and Thomas Jones on the next, and William Jones on the next. In the absence of any deputies there is no one to take your place. How will you make your eight hours?—In this way. On the question of deputy firemen there ought to be a distinction between that and a brattice man. In the whole of Glamorganshire a fireman has a brattice man, who in a sense is a deputy to a fireman.

Digitized by Google

Mr. John Henry Evans

27 June 1907

25791. Do not concern yourself about brattice men. Are you well advised in your strong objection to there being a fireman or two at the colliery more than there is immediate employment for in your eight hours?—That is for the employer to look at. What I object to is this: the deputy doing a part of the inspection previous to the shift commencing work, and that supervision handed over to the real fireman for the day's work.

25792. For that reason you object to the deputies altogether?—Yes.

25793. (*Mr. Wm. Abraham.*) That kind of work?—That kind of work.

25794. (*Chairman.*) If a fireman is ill you do not object to somebody being appointed previously in case the fireman cannot perform his duties?—Certainly not.

25795. You have 18 firemen. If one of you is ill you would not object to a man being appointed to take his place?—Certainly not.

23596. In case he should fall ill?—Yes.

25797. (*Mr. Enoch Edwards.*) Do you suggest if one was ill one would work two shifts?—No, it is not allowed.

25798. But you have a compulsory eight hours?—So far as our collieries are concerned.

(*Mr. Enoch Edwards.*) It struck me that if you object to these deputies there might be a difficulty in finding firemen competent to do the work. In your report you are good enough to say that workmen's inspection carried out according to Rule 38 has done a great deal of good. You also say that it is carried out in the majority of collieries. It is the first time we have heard that. We gathered from the inspectors in your district that this examination of collieries was almost a dead letter. I think that is the evidence.

(*Mr. Ratcliffe Ellis.*) I do not think so in South Wales. Some of the inspectors said it was a dead letter in Lancashire.

(*Mr. Smillie.*) Mr. Tom Richards said so.

(*Witness.*) It is practically taken up in the whole field of Glamorganshire.

25799. (*Mr. Enoch Edwards.*) Although they do not do it every month?—They do it some time in the year; some every month, some every two months, some three months, and some six months.

25800. You say it has worked very satisfactorily?—Yes.

25801. As to the employer finding the explosives, what do you mean by that?—There should be only one class of explosive used, and there are cases undoubtedly where the men are allowed to buy the explosives from different people that are supplying them. The hole would be bored 1¼ inches when they had the powder practically too large for the hole. Again, where the holes are 1¼ inches they would get the powder or ball supplied 2 inches. There is a risk in people trying to force a ball powder into a hole which is not so large.

25802. I understand that, but I am not asking you to elaborate that. Usually in the country the employers find them, and they are stored at the collieries?—Yes.

25803. Do you suggest for those reasons that they should be got from the company?—Yes.

25804. That would obviate men storing them in their cottage homes?—Yes.

25805. You do not say anything about who is to pay for it?—Of course that is another point. That is entirely a different point.

25806. It will lead me to what I want to ask you. You think they should be obtained from the firm?—Yes.

25807. The suggestion is that they are got from somewhere else. It is a question of price when they are got from somewhere else?—Not in all cases.

25808. Why are they got from somewhere else?—On account of the men themselves thinking that they could in some cases get them cheaper.

25809. There must be some underlying motive; human nature is alike everywhere. If the colliery company supplied the explosive, the men want it at the same price as a man keeping a store, what could be the object of buying it from the store-keeper?—

(*Mr. Ratcliffe Ellis.*) Perhaps it would be absence of common sense.

25810. (*Mr. Enoch Edwards.*) I want to know whether there is anything in the colliery people charging the man a higher price than he could purchase it elsewhere?—As far as the question goes, I am not prepared to answer that.

25811. There must be some reason for it?—Undoubtedly there is. It would avoid the storing of powder in the mine. The shot-firers would know the amount of holes to be fired, and could fetch that from the magazine, say at mid-day, and carry only what was required into the mine. Where the men are there is a lot of powder in the mine that should not be there.

25812. (*Mr. Ratcliffe Ellis.*) You are not allowed, under the Explosives Order, to store powder in a mine?—They take it in during the shifts, and if 80 places have five pounds each there would be a lot in the mine.

25813. (*Mr. Enoch Edwards.*) They might leave that for the next shift?—They might leave some.

25814. If supplied at the colliery it would not be down?—It would not be down the pit practically one-third of the time.

25815. (*Mr. Smillie.*) The brattice man you call in some places the roadsman or assistant?—We call them brattice men.

25816. They do timbering and redding, and other work under the supervision of the fireman?—Not in Glamorganshire—nothing but directing doors and seeing to the ventilation through airways and that those things are right.

25817. They are men able in an emergency to take the place of firemen?—We have plenty of them. We have two or three first-class brattice men gaining experience to become firemen, and so on, up to the top of the pole.

25818. You have no objection to this class of man, but only the method by which the deputies are at present employed?—Yes.

(*Mr. Powell.*) I quite agree with my friend. We do object, as he has stated, to a deputy examining a part of the shift of a district and not reporting. That is what you mean?

(*Witness.*) Yes.

(*Mr. Powell.*) These deputies I told you about do report. They sign their name on every report they make. If they examine only one or 10 places they sign for it.

(*Mr. Wm. Abraham.*) That is perfectly understood.

THIRTY-SEVENTH DAY.

Tuesday, 9th July, 1907.

PRESENT.

Lord MONKSWELL (*Chairman*).

WM. ABRAHAM, Esq., M.P. (Rhondda).
F. L. DAVIS, Esq.
ENOCH EDWARDS, Esq., M.P.
THOMAS RATCLIFFE ELLIS, Esq.
JOHN SCOTT HALDANE, Esq., F.R.S.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. WILLIAM BROWELL CHARLTON, called and examined.

STATEMENT OF WITNESS.

Mr. W. B. Charlton.

9 July, 1907.

25819. (1) The evidence I wish to give will be confined to:

What steps could be taken for the better prevention of accidents from winding and haulage.

The Federation of Enginemen's Associations have for 25 years urged that for the better prevention of accidents from winding and haulage, the Government ought to force all persons before being placed in charge of engines, to give evidence of their fitness by test to eyesight, hearing, that they have no mental or bodily infirmity, that they are of good moral character, and have a practical knowledge of the construction of engines, and that they have had a period of preliminary training in some kindred employment, thus preventing accidents like the following:—

(2) An inquest was held on the death of William Hutchinson, miner, Hummerbeck Colliery, Durham, in April last year. In the verdict the Jury expressed the opinion that the person in charge of the engine was not a capable brakesman.

(3) I attach a copy of regulations* enforced by the Durham Enginemen on all persons seeking membership and it is generally admitted that such stipulations, as are here given, have resulted in a very efficient staff of winding and hauling men being employed in the County of Durham. The enforcement of those regulations rests with the Enginemen's Association, and sometimes much friction and bad feeling is created between the management and the enginemen. We urge that the Government should claim to be satisfied as to the fitness of persons placed in those important positions.

(4) If keeps were used under the cages while men and boys were getting in and out of the cages a very prolific source of accidents would be abolished. If keeps had been used in the case already quoted the man Hutchinson would have been spared, for when the cage moved away, after the first three men got out, the cage would have reached the keeps and rested level with the getting out point, but there were no keeps in and the man was caught and fell down the shaft. If keeps had been used in the Boldon Colliery, Durham, case in August last, when three men fell down the pit 255 fathoms, the opinion of the Jury was, that two of the men would have been saved. Keeping the cages steadfast while the weight in the cages are varying by the men getting in and out is one of the most taxing moments for a winder. If keeps were used and the cages rested, then, with an adequate brake, there would be a reasonable guarantee that the cage would not move until desired.

(5) The practice of persons signalling themselves away from the shaft bottom, and from seams in the shaft, is dangerous, for the person must signal the cage to be taken away before he gets in. In many cases the engineman has to calculate upon what time should be allowed. The danger is increased in those instances where it is done when enginemen do not know. Usually this occurs during the night shift between the large groups or shifts of men being changed, when the datal men, horse-keepers, men doing repairs, etc., are passing from one seam to another. This is a growing annoyance to enginemen and source of danger.

In August last Whitfield Ridley, Bebside Colliery, Northumberland, was injured and died immediately after. He was able to tell his brother that the engineman was too quick for him, he did not give him time to get in after he had signalled. I remember some time ago a case where the person had signalled away, and in stooping to get in the cage after he had signalled, the slot, which is used to keep the tubs in position, got in between the collar of his jacket and his neck and detained him there until the cage went away, killing him on the spot, no one was near or this could have been prevented. This is a source of much anxiety to enginemen, who are responsible for the safe raising and lowering of men and boys.

(6) The shortening of the hours of winding-men's shifts is imperative if greater care is demanded from them. In Durham County there is a universal eight hours' day for winders. But in practice the 24 hours is divided into seven, eight and nine-hour shifts. The seven hours cover that portion of the day in which the bulk of the men are changed and the pit is busiest with coal drawing. The eight hours cover the remaining three hours coal drawing and changing the men, whereas the nine hours cover the portion given only to waiting on and changing men.

After 30 years' experience in winding at the largest collieries in Durham, one thing I know is that no man can exercise that tension and energy in the management of winding machinery for 12 hours that he can during eight hours. The most alarming accidents in overwinding have occurred in the fag end of the 12-hour shift, or even a longer shift. Winders have no cessation, no meal times. It is one continuous strain, and, remembering what Sir Lindsay Wood said in 1897 respecting the work of winding enginemen, it is a little surprising that some relief has not come in the shape of parliamentary shortening of their hours.

Sir Lindsay Wood told us in 1897 that there were 550,000 persons employed underground in the mines, and he estimated that the cages would make 200,000,000 journeys per year. The speed in some portions of the shift is at the rate of 40 miles per hour, with a total weight of 18 tons. There are few trades which are so taxing and trying to the energies and which make such heavy demands upon the mental powers of workmen as the winding engines at our collieries. This being the testimony of so competent an authority we urge that the Commission will enforce an enactment limiting the hours that winders are to work at eight per shift.

(7) We ask the Commission to do something to prohibit single individuals being sent into the mines alone to attend pumping engines and electric motors, etc., during week ends, and at night time when the pits are to be idle the next day. Men are compelled to go down often to some out of the way place in the mine to an engine beyond the possibility of communicating to any soul, no matter what may happen.

* See Appendix I.

Digitized by Google

Mr. W. B. Charlton.

9 July, 1907.

25820. (*Chairman.*) I understand you are the Chief Agent in the Union of the Durham County Enginemen ? —Yes.

25821-3. You belong to the National Federation of Enginemen's and Boilermen's Associations of Great Britain ?—Yes.

25824. You have been employed continuously as a colliery winding-engineman since 1876 until 1906; you have had 30 years' experience yourself in winding ?—Yes.

25825. You represent this National Federation ?—Yes.

25826. You express the views that the majority of the members hold upon this question ?—Yes.

25827. For 25 years your Federation has urged with the Government that for the better prevention of accidents from winding and haulage the Government ought to force all persons before being placed in charge of engines to give evidence of their fitness by test to eyesight, hearing, that they may have no mental or bodily infirmity, that they are of good moral character, and have a practical knowledge of the construction of engines, and that they have had a period of preliminary training in some kindred employment ?—Yes. The National Federation have done that in the shape of urging a Bill claiming that all persons employed as engine tenders and boiler tenders should pass an examination and give evidence of fitness. Five times that Bill has passed its second reading.

25828. When did it pass its second reading, what dates ? —I could not give the dates.

25829. Was it after the Special Report from the Select Committee on Steam Engines and Boilers (Persons in Charge) Bill ?—It has not passed the second reading since then.

25830. The reason being that the Select Committee reported against your Bill ?—The Bill that was considered before the Select Committee provided that men employed at mining engines, at factories, and all other kinds of engines in the country, should pass a similar examination and give evidence of fitness. We have drafted a Bill since then specially relating to collieries. The Bill we are now urging is relating only to men employed at colliery engines and boilers.

25831. In the Report of this Select Committee there is this paragraph: "Your Committee are of opinion that the provisions of the Mines Regulation Act, 1887, the general rules incorporated with that Act and the special rules which are fully detailed in the evidence of Mr. Ellis (Questions 2210—2220) are admirably adapted to secure the selection of competent persons for taking charge of engines and boilers, and for fixing the responsibility in the case of mines." The Committee were satisfied that the Act and Special Rules went far enough, and did not propose to Parliament that your Bill should be passed. Why were you not satisfied with these provisions ?—General Rule 24 only provides that the man that is to be in charge of an engine for the purpose of drawing men and minerals from the mine should be a man 22 years of age, a suitable person in the idea of the manager. If the manager says a person is competent there is an end to the question; the rule reads "In any mine which is usually entered by means of machinery, a competent male person not less than twenty-two years of age shall be appointed for the purpose of working the machinery which is employed in lowering and raising persons therein."

25832. There were certain Special Rules detailed in the evidence of Mr. Ellis which the Committee considered were admirably adapted to secure the selection of competent persons ?—Yes.

25833. Have you read those rules ?—We perceive that the Special Rules vary in districts. We do not know anything in the Special Rules that would result in securing a more competent man than Rule 24 of the Mines Act. It does not enforce any stipulation other than the 24th Rule.

25834. These Special Rules were, at all events, intended to go a little further than General Rule 24 ?—What they might be intended to do I do not know, but I have not seen, as one who has observed those things, where it does enforce from men more than what the Act does.

25835. This General Rule says merely "some competent person." There is no definition of what a competent person is ?—To illustrate my point—I just want to be understoood, that is all—I have submitted the Regulations in Durham which the Enginemen's Society have very fully, shall I say enforced—I say enforced so far as we as enginemen have been able to. We to-day have a request before the county owners, and one of the offers made is made conditionally, and this is the clause—I do not want to name the concession: "This concession to be subject to the condition that an agreement is come to by which enginemen will undertake to teach any man whom the owners may select for that purpose." This is our point, and it will perhaps illustrate the matter now under consideration. We think that competent winders ought to have a preliminary training that will make them ready to effectually deal, not only with anything that may take place in his engine, but if any matter intercepts his efficient working from the boilers which are immediately near, that that man would be competent by reason of his prior training to take in at once what is the matter in regard to steam failure or any other interruption coming as the result of forces outside. We have made it imperative that a man seeking to be a winder, a colliery engineman, shall go through this preliminary training that he may be easily competent to grasp anything that may take place.

25836. Have you succeeded in enforcing your rules in the County of Durham ? Are only members of your Association employed ?—Very largely so. It has been accepted now mutually between us and the owners. We do not train anyone, neither can we, except the manager or the engineer nominates and signs a permission, so that in that respect it is mutual; but some of them resist it.

25837. Do you wish to keep this Association in any way a close corporation ? Would you leave it to the managers, with the consent of the men to be taught, to settle the number to be apprentices ?—We say that is an aspect that may be reasonably got out of the assumption, and that is why we are urging that the Government should undertake to be assured that the men placed in those charges are competent men and not the Durham Enginemen's Society.

25838. That is my point. Mr. Ellis will, no doubt, bring it out afterwards, but the suggestion on behalf of the owners is that you would make engine winders a close corporation; you would seek to limit the number of apprentices ?—I will say this in reply; I do not know a single application that has come jointly from the manager and the men at the colliery that has been refused by the authority that now has this matter in hand. During the last 18 months we have given permission to 75 men in our county to be taught to wind, and 63, I think it is, to be taught to haul underground; that is the whole of the applications.

25839. You have not yet refused any applications ?—No.

25840. Are you satisfied with the state of things in Durham ? If what is the practice in Durham was carried out throughout the mines of the United Kingdom would you be satisfied without a Bill, or do you still think the Bill would be desirable ?—I only put this forward as showing the direction in which we are seeking a guarantee of fitness. I do not put that as the full measure that should be applied, but it would certainly be a considerable improvement upon what we have, if it was sanctioned by the Government.

25841. What do you mean by "sanctioned by the Government" ? Do you mean the Government should say nobody shall wind unless he has this certificate from your Association ? Is that what you want ?—No, unless he has a certificate of that kind from the Home Office.

25842. I thought your Association, under the Durham Rules, did give certificates ?—Yes, we do, and we should like it if the Government would undertake to make it imperative that all men that have to be appointed at colliery engines should obtain a certificate after an examination, as we do in Durham in our little way, but rather more technical and in a larger way.

25843. Do you propose that the examination should do anything more than test the physical fitness of a man for the work ? The examination you require would merely test the physical fitness of a man. He must be of good moral character, steady habits, and possessed of ability ?—Yes.

25844. Do you propose to test by anything but a medical examination and certificate of character ?—Those claims are certainly imperative, but a man could not be a winder if his hearing was defective or his eye-sight was defective. We have had instances before us like this, that a man without medical examination has been accepted and a certificate granted, and after two months' practice it has been found that he was defective in hearing, and we have had to remit his fee and withdraw his certificate. Our only means is by a committee of enquiry. A medical examination would be necessary.

25845. Do you propose any examination except a medical examination ?—What we urge is that a man who is accepted to be examined should be a man who has had

Digitized by Google

prior qualifications—who had as a preliminary been employed as a stoker or boiler-minder, or kindred employment.

25846. That is not a question of examination?—No.

25847. I was asking you as to the examination. You say there ought to be an examination to test physical fitness. I understand your suggestion as to a test of physical fitness, and that he should be of good character, but I am not certain whether you think it would be advisable to force him to go through any other kind of examination except for physical fitness and good character?—Why I have named that is that it is made imperative so far as our examination is concerned. We would not examine any man unless he had this preliminary training. What we desire the Government to do is to ascertain whether the man's knowledge of the construction of an engine technically, and his practical knowledge of winding, are such as they would regard him to be a fit man to be entrusted with the engine. That is all.

25848. Do you give any written examination before you certify that a man is a competent brakesman or hauling man?—No; the only thing is the manager at the colliery and the men under whom he has learned testify that by practice he is an efficient winder, a competent winder, and has wound for 12 months, and then we give a certificate. That is as far as we can go.

25849. You suggest the Government should go further, and institute a test as to whether a man knows the theory of winding and the theory of haulage?—Yes.

25850. That is your suggestion, at all events?—You will pardon me, but I do not know what may be meant by "theory."

25851. I will use your own words if you like: understanding the mechanism of the brakes, and so on—not only understanding what you are to do to haul a cage up and down, but understanding the whole mechanism of the engine, so that if anything goes wrong he should know how to set it right, or ask assistance in seeing it was set right?—You do not mean such a theory as would enable every man to work out the horse-power of an engine? We do not mean that.

25852. You go on to the question of keeps for making the cages steadfast. A good many accidents have happened owing to the cage getting into motion prematurely?—Yes.

25853. Whilst men are getting in or out the cage goes up or down, and accidents have happened, and you suggest keeps should be used?—I may say in my experience, and generally. We have not very much to complain of in this respect, but there are times. Take, for instance, at week-ends and during night-time, when we are not drawing the coals; often the heapstead is left without an attendant, and, as I have said here, except a man has a very reliable brake to his engine, keeping the cage suspended by gently applying steam while the load at the top is lessening, it may be the load at the bottom is increasing, because while men are getting out at the top others may be getting in at the bottom, and you can have a lessening load at the top and an increasing load at the bottom, thus making it a difficult matter to keep his stage stationary while that was being done. If keeps were there the cage could be kept at rest.

25854. You suggest that keeps should be made compulsory?—We do.

25855. What is the usual practice with regard to keeps? Are they used or not used?—They are used: that is the usual practice.

25856. Sometimes cages are let down without any keeps?—The keeps are always there. Usually the keeps are balanced, so that when the cage comes up each deck passes and they fall in, and you come back on to them. At night time, before the attendant leaves he brings the lever up and latches it up to keep the keeps out of the way. When the bulk of the men are changed, after the pit is done they will do this. When the full shift of men come to go down an attendant will come in with them, and from that time they commence to use them again for the next day, but incidentals, shift men, and repairing men, are often left without an attendant and without keeps.

25857. What is the object of putting these keeps back so that they do not act during the night?—It would be impossible to have them used without an attendant. If a workman comes on to the bank top to come down he calls to the winder to bring the cage up: he gets in and calls out the seam he wants to go to, or the bottom. He could not use the keeps himself: he must get in while they are out, or the cage could not go by.

25858. How do you propose to deal with that point?—I think that the Mines Act very largely deals with it; I do not say that I could drop on it exactly. The suggestion is that the attendant, the banksman, and the onsetter must be in attendance while men are getting in and out of cages. It is the intention of this that there should be men at the top and the bottom.

25859. You think the spirit of the Act is infringed by this practice of taking away the men who have to attend to the keeps during the night, and that ought not to be allowed?—Yes.

25860. Then you give instances of accidents that have happened. These accidents are still happening, I suppose?—I do not say that.

25861. In August last there was an accident?—Yes, but that was a temporary arrangement that they had. They had the keeps, but there was some special work being done. I have only cited that incident to illustrate what I mean. I do not suggest that the practice of changing men without keeps is very extensively in vogue in our county.

25862. You think this practice of not having men to look after the keeps during the night and, consequently the keeps having to be put back so as not to act, is a dangerous practice and ought not to be allowed. You cannot lay your hand on any recent accident that has been caused by that practice?—Yes, I have a case here of Hummerbeck. A miner fell down the pit at Hummerbeck on April 7th, 1906. After deliberating in private, the jury returned a verdict of accidental death. They recommended that the brakesman should not leave his engine, and that when the men were riding keeps should be used. They expressed the opinion that William Meynell was not a capable brakesman.

25863. (*Mr. F. L. Davis.*) That was the man in charge of the engine?—Yes. I cited that in my Statement. If keeps had been used in the instance I quoted, this man would have been saved, because the cage went away prematurely. It would have gone on to the keeps and the man would have been all right.

25864. (*Chairman.*) This was where keeps were not used at all. You say not only must keeps be used in all cases, but they must be used at all times. Not only must they always be there, but always have somebody to attend to them and see that they can be used?—Yes, because the Mines Act somewhere does say, that the men at the top and the bottom shall be in a position to signal to the engineman in the event of anything taking place while the cages are running in the shaft. If there is no one there, that part of the Act cannot be carried out, because the cages would be running the journey and something might take place on that journey the same as any other journey.

25865. Although it is no breach of the rules to put up the keeps, it is a breach that nobody should be there to look after them?—Quite so.

25866. Or a practical breach of the rules; at all events a breach of the spirit of the Act. Perhaps it is some Special Rule you are referring to?—This is a procedure difficult to me, differentiating between the Act, General Rules, and Special Rules.

25867. At all events there is some rule in operation to the effect you have stated?—Here is the Special Rule in the Special Rules for Durham County, what they call the West District. It says: "Each banksman shall have control of the shaft top and each onsetter of the shaft bottom, and shall not allow any person to descend or ascend the pit without permission from the proper authority; he shall regulate, subject to any directions of the manager or under-manager, the order in which persons shall enter and leave the cage, and see that the authorised number only descend or ascend at one time, and shall not allow any person to descend in a state of intoxication, nor allow any intoxicating drink to be taken down the pit, except by special permission."

25868. Under that rule it would be necessary during the whole 24 hours, or when it was possible for any man to have to go down, that there should be somebody on top and somebody at the bottom?—Here is Rule 86 in this Code, which says: "When persons are to descend or ascend, the agreed signal shall be given by the banksman or onsetter only, except where otherwise authorised; and when persons are descending or ascending, the banksman and onsetter shall remain in a position so as immediately to signal the engineman in case of an accident."

25869. As regards keeps, you would be satisfied if that Special Rule was carried into effect and if keeps were made compulsory?—Yes.

Digitized by Google

Mr. W. B. Charlton.

9 July, 1907.

25870. That Special Rule, you think, might be made a General Rule ?—That is what we think and desire.

25871. For the whole of the United Kingdom ?—Yes.

25872. As regards hours, you say you ought to have eight hours a day for winding, and you refer to the evidence which Sir Lindsay Wood gave in 1897. What do you mean by " told us " ?—That was something Sir Lindsay Wood said at the Mining Institute in the North respecting the journeys.

25873. He was making an address to the Mining Institute and said that in the course of his address in 1897 ?—Yes. In Durham we have an arrangement for an eight hours' shift—an eight-hours' day throughout the county for winding. A provision of this kind made by the Government would not affect us much as a county, but as a representative of the National Federation, I am urging this with a view to bringing about an arrangement of eight hours throughout the whole mining districts.

25874. In Durham you have eight hours ?—Yes.

25875. You do not complain as regards the length of hours. You have no complaint to make as regards the practice in Durham. You want that practice made universal by Act of Parliament ?—Yes. We have instances, although they are few, in which men in Durham have stood excessive hours because the management would not otherwise provide for the man stopping 16 hours, two shifts, if his partner was ill. He would not be prohibited from staying 16 hours, and I have one or two instances in my mind where accidents have occurred while men were doing one of these longer terms than eight hours.

25876. That would be difficult to provide against. It would be a reasonable thing if a man was ill that his mate should take his place for the next shift. That would be a good arrangement. How would you manage that ? —We think that there ought to be a provision of that kind.

25877. In case of illness ?—In our arrangement with the masters in Durham we have pledged ourselves thus, that in the event of a man being ill, that two men shall make up the deficiency by following in eight hours at work and eight hours at home, but that is not strictly adhered to. Sometimes two men, rather than do that, stand 12 hours each, because the other method brings them oftener from home to work and consumes part of the time in coming and going.

25878. You think in Durham things are not what they ought to be in regard to hours, and you ought to come to some arrangement whereby under no circumstances should any man be allowed to work for more than eight hours as a winder ?—Yes.

25879. You think that should be enforced in all cases of illness where possible, because a case might arise where the next man could not do his shift through being suddenly ill. The man who had completed his eight-hours' shift would have to go on until somebody could be brought. In a case of necessity you would allow that ?—That is one of the things that we urge upon our people : no matter what the intervention was, as the winding-man holds the gate, so to speak, of the highways of the mine, he must not go and leave it, because he stops all means of getting in and out.

25880. You say in conclusion : " We ask the Commission to do something to prohibit single individuals being sent into the mines alone to attend pumping engines and electric motors, &c., during week-ends and at nighttime when the pits are to be idle the next day " ?—Would you pardon me if I refer to paragraph 5 respecting signalling men at the bottom.

25881. Certainly ?—That is a thing we, as winding men, feel very much about. It is at week-ends and during night turns. This is what took place at the bottom. What I complained of at the top before was largely affecting the top. This is the bottom and we are subject to men coming and giving us a signal that they want to ride, whereas the Special Rules provide that they must be seen into the cage by the attendant and signalled away : but in practice in many places at week-ends and night turns—I do not mean when pits are doing their full work—a man comes to the shaft bottom and signals himself away. After he signals, the enginemen have to think, " Will he be in now ? " They have to give him time. When I was an apprentice my old tutor said, " I will tell you what to do—count 12," and that was the time in which any man could get into the cage. Of course I did not always count 12, but one got so that we could measure the time somehow or other. It is not a safe practice. In Northumberland Bebside case I have referred to, the man was not killed right out, but he told his brother-in-law that the engineman was too sharp for him and caught him. I remember another case, where, as the man was stooping getting in, the slot that comes down to keep the tubs in position, got in behind the collar of his jacket and he was held until the winding-man took the cage away, and he was killed. We do not like such risks. It is a thing that produces in us very much anxiety. Supposing we give a person over time. If we waited too long I have known instances where the man has thought, " I have not given the right signal, I had better get out again." It is a very dangerous thing. You must just give them the right time to get in nicely and get away. If you hold the man, the chances are he thinks, " I have not signalled right and I will get out." We do think that the Government should prohibit that.

25882. (*Mr. Ratcliffe Ellis.*) Do you want the signal to be in the engine-house ?—No ; we want an attendant at the bottom to see that this man gets in, and signal the man away.

25883. (*Chairman.*) That would be necessary if it was obligatory to have the keeps in position, so that they could act. You must have somebody down below. That would be necessary if it was obligatory to have the keeps in acting order ?—That is so, excepting there are more decks than one. You generally go on to the bottom, and that does not need keeps except there are more decks, in which case you lift the cage and put them back on to the keeps.

25884. There ought always to be somebody at the bottom to see the men safely in ?—Yes.

25885. The keeps should be put in position and should not be released until the man had got in ?—That is so.

25886. Do you wish to say anything more on that point ?—No.

25886A. Then we will go on. You do not want single individuals sent into mines alone ?—No. I do not think that obtains to any very great extent, although it does obtain. At the present moment, for instance, I have a letter—I am not going to read the letter—where the Secretary says, " What I mean is they want one man to look after both pumps at the week-ends, and they will be the whole time of the shift alone in the pit." That, we think, ought not to be. At this particular job that I instance there are two men, two engines 500 yards apart, and through the week there is one man at each engine, but at week-ends one man is sent down alone to attend to those engines, and we think that no man ought to be alone in a mine.

25887. (*Mr. Ratcliffe Ellis.*) With reference to your last answer, it may be quite right, but why do you think that a man should not be alone in a mine ?—A very little accident might disable him from getting out-bye to the shaft. He might be scalded by his engine ; a small accident might keep him fastened where he was, until somebody got concerned about his not getting home, and they would go and, perhaps, find the man unconscious, or in some way incapacitated, or injured, and we think he should have some company.

25888. That would mean that there must be another man there doing nothing, but being there in case anything happened to the other man ?—I do not know that it would mean a man. A boy would always be an efficient messenger.

25889. There may be two or three men in the pit, but not sufficiently near to render assistance in case such a thing as you suggest happened. Your idea is that wherever one is employed there must be a man or a boy with him to take a message if he is hurt ?—We do not ask for this where there are other men in the pit. They may be in other districts. We say there ought always to be more than one man in the mine.

25890. Would not the reason you have given apply also if there are six men in the pit in different districts entirely away from each other ? They would not go and look and see if an accident had happened to a man. He would have no means of communicating with them ?— That would obtain there as well.

25891. If your suggestion is carried out, it must mean with each man down a mine during the night—this is between shifts—there must be a man or a boy for the sole purpose of taking a message if anything happens ?—It is a serious matter for a man if employed in an out of the way district and he is scalded or injured, and he is helpless until accidentally somebody finds him out.

Digitized by Google

25892. I want to know whether or not you seriously suggest in all cases of that kind there must be somebody for the sole purpose of taking a message in case he should be hurt?—We think, for the man's safety, that there should be a provision of that kind.

25893. You thought a man before, but you think a boy might be sufficient?—Did I say a man?

25894. I may be mistaken, but I understood you to say a man?—"We ask the Commission to do something to prohibit single individuals being sent into the mines alone to attend pumping engines and electric motors." That is what we desire.

25895. I should be glad of some assistance as to how the Commission is to do that. Somebody must go down. It is not preventing the man going down?—No.

25896. Your only remedy is for the purpose of taking a message that this man is hurt, that there should be a second person with him?—It would not be an extraordinary claim upon the employers.

25897. I want to know what you suggest. It may not be a large claim. That is what you suggest?—We suggest that where a man is employed tending an engine or an electric motor, that there should be someone that can run away in the event of an accident or injury, or whatever it may be, and communicate it to somebody.

25898. Is not that really what it comes to? You suggest that there should be some person there with no work to do except to wait on the chance of this man meeting with an accident, to communicate it to somebody?—Well, yes.

25899. Do you find the number of accidents to these single men very large?—As I said before, this does not obtain to any large extent. I do not know, probably, that I could get more than a dozen cases in Durham. I do not know that I could, but so long as it is possible we think that something should be done to prohibit it.

25900. (*Mr. Ratcliffe Ellis.*) I do not quite understand what these keeps are. When a cage gets to the top of the pit there is a lever drawn, and these are drawn out from underneath and hold the cage steady?—Yes.

25901. What is it you want beyond that?—Nothing.

25902. You want these keeps to be always put into action when the cage is at rest, that it should hang loose in the shaft?—In ordinary coal drawing in ordinary working with men, as the cage comes past, the keeps are weighted to position and the cage puts them by until the decks pass, the cage then comes back on to the keeps. There is a portion of the 24 hours in which there is not, probably, much done, and they do not have an attendant, and they fasten the keeps back and the cages go up with men, and there is nothing to steady while the men are getting in and out.

25903. They do not have an attendant. There is a banksman, surely?—In some places there is no banksman.

25904. Nobody on the pit, and the men get in themselves?—Yes.

25905. You want, when men are wound up and down, that there should be an attendant to see that these keeps are working, and that the cage hangs on the keeps and does not hang loose in the shaft?—That is so.

25906. The banksman is required to be there by the Act, or your rules. All you really want is your rules carried out. "Each banksman shall have control of the shaft top, and each onsetter of the shaft bottom, and shall not allow any person to descend or ascend the pit without permission from the proper authority"?—That is it, the proper authority.

25907. He has to be there. I should have thought it meant the banksman must be there on the top and the onsetter at the bottom, to see that they come in properly?—We believe the practice in some places is a contravention of what is intended by the Act.

25908. It ought to be put as a General Rule, as his Lordship has said. With regard to the hours for the general winders, you have in Durham eight hours?—Yes.

25909. In some places they have a good deal longer?—Yes, I believe they have.

25910. In Lancashire they have longer than that?—Yes.

25911. One of your rules for the engineman is that he shall have "responsible charge of the engines, boilers, and the whole of the machinery with its appendages in and about the mine, and all erections on the surface." I see that is not the engineman; that is the engineer. Has he to do anything except winding? Has he to clean his engine?—Yes, very often, and grathing.

25912. When does he do that?—Generally at week-ends. Cleaning and grathing is done at week-ends after we have drawn the week's output of coals and the week's work is over.

25913. During the eight hours is he winding all that time?—Yes, winding all that time, either men or coals. We say he winds 10 hours, coals and men, and men with casual work for 14 hours.

25914. How is this eight hours you speak of? There are 10 hours occupied in winding coals and men?—Yes.

25915. Do you change the winding engineer?—Yes, because after this is done, the shafts, according to this regulation, are to be examined. Men come in and they examine the shafts, doing repairs, etc. Then large timber that cannot be sent in the cages is sent down on the cage tops. Ordinarily we have the inspectors and three shaft men. Then timber goes down; then there is a shift of what we call the shift men, who may come in, and other men to keep the pit in order. We have frequently men changing during the night. It is continuous. The men are there continuously from six in the morning till six the next morning doing something.

25916. You have three enginemen, and they take eight hours shift each?—Yes.

25917. They change the shift: it does not matter what is going on, whether coal, men, or timber is going down, the men change at a certain hour?—Yes.

25918. If the relief man does not come, does he go on?—Yes, he continues. We know that.

25919. You recognise that?—We recognise that he could not go and leave the engine.

25920. You think that arrangement is satisfactory. What if the second man did not happen to come?—In that circumstance the man would communicate with the manager or the engineer, as the case may be, intimating that "My partner has not come in; kindly have me relieved after four hours from now." If I was at the engine and my partner did not come in I would intimate to the engineer, "I am willing to stop four hours; kindly arrange for my being relieved at the end of four hours," and thus we would make up the middleman's time by that arrangement.

25921. You do not bring in a relief man other than those regularly engaged at winding that engine?—There are some places where they have relief men, but it is not customary.

25922. It is not usual in Durham?—No.

25923. You must make arrangements with the men who usually wind, but you cannot bring an outsider to take charge of the engine?—No.

25924. Do you think that would be preferable to having a man working 16 hours—two shifts?—Calling a relief man?

25925. Yes.—Yes, it would be. As I said before, we have an arrangement if one of the three men does not come in, then the other two must fill the time in.

25926. They divide it?—Yes.

25927. (*Mr. Wm. Abraham.*) That is in cases of emergency?—Yes.

25928. (*Mr. Ratcliffe Ellis.*) With regard to the qualifying certificate, you are an engine-winder, I believe?—Yes.

25929. You did not have a certificate?—No.

25930. Are you any the worse for it?—I should think I am worse. If I had been able to get a certificate from the Government at that time I think I would have had a better start than I got.

25931. The qualifications of an engine-winder, some of them at any rate, you can hardly ascertain by an examination by the Home Office—nerve steadiness?—That is so.

25932. You would have to find out in some other way?—Yes.

25933. Experience?—Yes.

25934. A Home Office examination would be merely as to the knowledge of the engine?—Yes.

25935. How would you ascertain that he was satisfactory as to what I should say are the more important qualifications, the natural physical qualifications?—We think it could be ascertained in two grades; for instance, a man would satisfy the Home Office that he was a fit and proper person to be taught to undertake to learn the duties, and then, after he had demonstrated his fitness by

Mr. W. B. Charlton.

9 July, 1907.

practical work to the manager and to the men, a report of this kind would be submitted, and further examination by the Department before he got his certificate of competency.

25936. Do you propose, before a man begins to learn his business, that he must have a certificate from the Home Office that he is a fit and proper person to be taught ?—Yes.

25937. A preliminary examination ?—Yes ; that is what we think.

25938. That is not part of your Bill ?—Yes, I think so.

25939. Your Bill was that persons should have a certificate, but after he was supposed to be competent, a certificate to say that he was competent, not a preliminary certificate before he began to serve his apprenticeship ?—I think the Bill seemed to regard winding as being a point to be reached by a first-class certificate. A man who had not a first-class certificate could only take jobs of less importance than winding, and that in the first grade a man would come to such proficiency that he could take charge for instance, of the fan and the pumping engine, and the haulage.

25940. I think if we look at the Bill it provided that no person should be entitled to work a winding engine who had not got a first-class certificate. That was the principle of the Bill ?—Yes.

25941. It would be an offence, punishable ?—Yes.

25942. Therefore the effect of that would be, whatever happened, as you say, the winding man holds the gate, and the gate would be held by a certificated winding-man, and no other person could obtain access to the mines or bring anybody out of them ?—No.

25943. In order to obtain a certificate you agree that the apprentice must be taught his business ?—Yes.

25944. The facilities which are afforded for teaching him his business would very largely depend upon whether he got a certificate or not. If the facilities were easy, if a man could learn his business without any difficulty, there would be more certificated men than if a man was restricted in learning his business. Supposing your Association claimed the right to say, "We shall not teach anybody except the persons we decide upon," your Association would hold the gate ?—Yes.

25945. You did not quite answer his Lordship's question as to whether you claimed that you should have the right. You said you could not call to mind an instance when you had refused a nominee of the manager, but do you claim the right to refuse a person nominated by the manager ?—An unfit person.

25946. Fit or unfit, do you claim the right to say that you and you alone shall say who shall be taught ?—That is governed by this: The 24th Rule makes the proper discharge of the work incumbent upon the person in charge of the winding engine. Our position is this : if the management force the man who has charge of the winding engine to teach another, and the teaching of that other embarrasses the man, hinders the man from efficiently managing his work, then that is an undue interference with the winder, and if he happened to bear the consequences of that interference and liability, we claim on these grounds that we shall have an assurance that the least possible embarrassment shall take place in the event of teaching another.

25947. I should like to go further than that, and know whether your Association claims the right to refuse to teach a person of whom it does not approve ?—Well, yes, we seek to claim that right.

25948. I want to read you a few rules ; no doubt you are acquainted with them. First of all, take your own rule : "Any person wishing to become a member of this Association, to be taught the art of winding, must obtain the consent of some competent financial member or members, who will undertake to teach him, and be proposed and seconded by two financial members at least one month previous to his admission." You mean that in its fullest sense your Assoication are to control the persons who are to be taught to wind ; therefore your Association would control the persons who would have certificates ?—Yes.

25949. And your Association therefore would control the gates ?—No, I beg your pardon. What we are asking the Government to do is to remove these restrictions from the authority of our Association and to enforce them themselves, and then that would cease to be so. Through what we have done we have a more efficient staff of men than we would have if these regulations were not in force, and we do not want them to rest there : we want the Government to determine on some other code than our rules and enforce them.

25950. Supposing the Government said : "We will nominate persons entirely outside the Enginewinders' Association to be taught," your rules would not allow you to do that ?—We would have to make our rules to fit.

25951. I think you are the General Secretary of the Association ?—Yes.

25952. In the St. Helens Association of Colliery Enginemen, Rule 10 says : "A member who teaches anyone the business of an engineman, unless he is his son or brother, or the son of another member of the Association, will be fined not more than forty shillings." In the Cumberland Enginemen's Friendly and Protective Association, Rule 9 says : "No member may allow a non-member (except his partner) to interfere with his engine, nor may he instruct a non-member with regard to the working of his engine." The Wigan, Bolton and District Colliery Enginemen's Mutual Protection Association says in its rules : "No member of this Association shall be allowed to instruct any person in the business of engine-winding so long as there are competent persons of respectable characters who are out of employment, and who are members of this Association ; but if there are no members out of employment, then the Committee shall have power to confer with the management of collieries with a view to the next best person to be learned or instructed. It shall be optional for a member to instruct his son, if he deem it necessary, for the purpose of making him a competent winder only, but a member's son shall not have the preference of a vacant situation before a member of this Association. If it be proved on the testimony of two witnesses that this rule has been violated by any member (after the issue of these rules), such defaulting member will be expelled from this Association." Then the rules of the Enginemen, Boilermen and Firemen's Amalgamated Association of Great Britain and Ireland say : "If any engineman, boilerman or fireman be asked to teach a man the business of an engineman, boilerman or fireman, he must first acquaint the president or secretary of the lodge he belongs to before he takes any further steps, and they will instruct him how to proceed. If any member, after having received such instructions, be taken advantage of, he shall receive his current rate of wages for three months, after which time his case shall be reconsidered by the Association, *i.e.*, he shall receive out-of-work pay from his own lodge, and the remainder from the Association." These are specimens of the rules. I put it to you if there is to be this limitation upon the persons who are to be taught to wind, and a person is not to get a certificate of proficiency unless he is taught, and the men cannot be now, except by a person who has a certificate of competency, it would place your Association in charge of the gate, as you very properly term it, of the mine, and prevent the owner getting into his own mine except by your sanction ?—I admit it.

25953. Do you remember in the year 1895 a difficulty arose at the Wigan Coal and Iron Company's collieries ? I rather think you came down at the time ?—I did.

25954. Did you say at that time that the Association were to have the option of saying who should be taught ? —Yes.

25955. That is what you say to-day ?—Yes, as the regulation of things is to-day we still say so.

25956. (*Mr. Smillie.*) If the Government took up your position and had an examination, that would change it. You have been doing what you want the Government to do ?—In some districts in a very objectionable way. They have to give evidence of some fitness and some preliminary qualifications and submit to certain regulations which may seem to be out of propriety. We desire the Government to lay down a general line outside of the societies, and that would do away with the preference of enginemen's sons and brothers.

25957. (*Mr. Ratcliffe Ellis.*) I quite agree with you to do anything possible to secure competency of an engine-winder, which is a very responsible position. If the Government adopted a principle of examination, would you be prepared to say that these restrictions would not be pressed as to the persons who should be taught ? If you do not feel justified in saying that, I will not press it ?—Will you repeat the question.

25958. Supposing the Government decided to have an examination for engine-men as to their competency, would you be prepared to say that the rule of your Association, which requires that you shall have the option of saying who shall be taught, might be altered so as to enable persons to be taught who were approved by the examination of the Home Office ?—My private opinion is that if such a regulation was drafted by the Government, it would be imperative on our part to change our regulations. I do

Digitized by Google

not know whether there are not certain matters in them that our people might not seek to retain, but the general aspect and reading would be done away with.

25959. (*Mr. Wm. Abraham.*) As I understand your position, you are here to advocate that competent men only should be allowed to work these engines ?—Yes.

25960. That is your object, and not that they should be members of your association ?—No.

25961. Your first object is that this should be so in order to save lives and limbs ?—That is so.

25962. If the Home Office undertook to make i compulsory that none but competent men should be employed in winding engines at collieries, you would trust your society or other members, as other unions do, without having these rules as they are now ?—Yes. I would not like to be misunderstood, and there is one thing I should like to mention. As it has been observed here, a man might satisfy a committee of inquiry of the Home Office as to his fitness in many respects, but it has often been seen that after a trial his nerve was not such as made him a fit winding man. We might know a man from our practical knowledge, from every-day touch with him, that he was a man that could not be a winding man. What I want to point out is this: it is a fact in the practice of teaching men to wind, where there are three men, one of the men has been sometimes really incapable of teaching. He could not admit of any embarrassment at all or any interruption outside, anything that took his mind from his work. We have men who cannot do anything in the way of teaching. It is as much as they can do to manage their work. We think neither the Government nor our society should force such a man, who can do his work without embarrassment, to be interfered with. We think so far as protecting him from embarrassment is concerned that might even come from a Home Office Committee. We would try to construct something to protect a man in such circumstances.

25963. Two examinations have been spoken of. Mr. Ellis was good enough to say one is as important as the other. What is the first examination you lay down as a rule. Is it a physical one or the ability of a man at his engine ?—The first is that this 24th Rule provides that he shall be 22 years of age. We say that the man is 22. So far as we are able, we do not ask any doctor's certificate or examination, but we are assured that the man's hearing is good and his eyesight is good. We are assured that he has a good moral character, and that he is a steady man. That is one point we make. What he has been employed at previously, and if a man can give evidence that he has been employed as a stoker, or attended boilers, or been otherwise employed at engines for a period of three years, we accept that as a satisfactory condition, and if we are satisfied on those other matters we give a certificate or permit, such as you have, and he commences then to learn. The second stage is from report. If the men under whom he has learnt and the manager are agreed that he is a competent man, they make a report to us and we sign another certificate.

25964. You think as a practical man that it is necessary that a man should have a certificate to prove that he has passed a satisfactory examination, and in that examination proved himself to be a competent engineman before he is employed ?—Yes, we do.

25965. What would you examine him on, to start with. Take the two stages: the preliminary one, the man's acquaintance with boilers, and so forth, before he becomes a winder. What do you consider the qualifications to be ?—In the first place we should claim that the man should have a correct knowledge of the keeping of the boilers under safe and proper conditions, and that he should know the construction of his engine and not only as to the movement of the handles to produce a certain motion, but as to what really takes effect in the piston, what produces the movement. I do not mean of a close theoretical kind, but such a one that the man knows in himself what is taking place and what power he has caused to operate.

25966. In your opinion is that not necessary in order to find out the intention of the rule already in existence. Rule 80 here says: "The engineman, or some competent person appointed by the engineer, with the consent of the manager, shall once a day thoroughly examine his engine, rope rolls and flanges or horns, the ropes upon the rolls or drums, the brake, and the signal bell or indicator showing the position of the cage in the shaft, and shall immediately report any defect he may observe to the engineer, foreman enginewright, or other authorised person for the time being appointed by the manager." Before a man is able to do that he ought to be able, in your opinion, to prove by examination that he is competent ?—I think that is so. I think the man ought to know sufficient to enable him to determine whether those things are right or wrong that he has been examining. His competency is left with the opinion of the engineer.

25967. I will come to that now. You want another authority not interested simply in the mine and seeing that the man produces so much coal, some independent authority, independent of the employer, the owner and the workmen ?—That is it.

25968. Some authority to ascertain that this man, before he is employed in that important position, is a competent person ?—That is so, to discharge the duties that are incumbent on him by this rule.

25969. Take an engineer employed in a ship: he has to have a certificate ?—He has.

25970. As a rule he has as many persons under his care as you as winding enginemen have ?—Yes.

25971. Winding enginemen have as many men's lives in their charge as any engineer employed anywhere ?—I should think so. That is proved by what I refer to in my statement: "Sir Lindsay Wood told us in 1897 that there were 550,000 persons employed underground in the mines, and he estimated that the cages would make 200,000,000 journeys per year"—that is made by the winders.

25972. All you want and all you consider essentially necessary is that these men should be thoroughly competent, approved by an independent authority not connected with the mine at all ?—That is just what we want.

25973. You know of several cases where lives have been lost because men were not kept at the keeps, when men were allowed to descend and ascend the shaft ?—Yes.

25974. Do you think that should be put a stop to ?—Here is a case that took place on August 11th, 1906, at Boldon Colliery in Durham: the Jury returned this verdict: "We find the three men were accidently killed through the overwinding of the cage by mistake of the engineman. We entirely exonerate the engineman from blame owing to the fact that he was working an engine entirely different from the type he had been accustomed to work. We are of opinion that the provisions of the Mines Act had been carried out there, but think that the lives of at least two of the men might have been saved if detaching hooks and keeps had been used."

25975. You have given in evidence instances of several lives being lost because men were allowed to ascend and descend with nobody at the keep ?—Yes.

25976. In your opinion that ought not to be allowed ?—We think that.

25977. In your opinion, as a practical engineer, in the ordinary state of things men should not be allowed to be at the handles more than eight hours a day ?—Yes.

25978. But in order not to prevent the working of the colliery, you are making provision to keep the handles going ?—Yes. I may say in relation to the hours, I have already said that in Durham we have an arrangement for eight hours per day for men and this is what obtains. We really divide the 24 hours into seven, eight, and nine hours. The practice has commended itself to the men. In the busiest shift we have seven hours; that is during the part that is all coal drawing and men changing, that is from six to one. The next shift we have only half full time and half incidentals, and that is eight hours, and then the nine-hour shift, that is changing men and waiting on men and casuals, nine hours. So that even with eight hours we have deemed it necessary to institute in Durham universally seven hours for the busiest part of the day, and it is a custom that commends itself to the employers as well as to ourselves. We cannot exert for a longer period that control and attention and manipulation of the engine over 12 hours.

25979. In your opinion a short shift for a winder is essential in the interests of the safety of the mine ?—We believe so.

25980. With regard to the question of a man being alone, supposing there was one man in three or four districts, it would be possible to keep a boy to pay a visit to various places now and then and see that nothing was wrong ?—Yes.

25981. So that you need not keep a boy even at each place ?—No.

25982. Where the safety of life is at stake the employment of a boy probably should not be considered too much to provide ?—No.

Digitized by Google

Mr. W. B. Charlton.

9 July, 1907.

25983. (*Mr. F. L. Davis.*) Do you think that a boy walking about in three or four different districts to see that the men employed there are all right is a sensible or reasonable thing?—We quite see that something might happen to the boy on his journey and nobody know.

25984. Would you not want a bigger boy to look after that boy?—Outside of that, I think really one man in an out-of-the-way part of a mine attending on the engine is something we should provide against.

25985. How often does that occur, that there is only one man in the mine?—When the mines are free from the ordinary working, such as week-ends. In this instance I have cited here, the facts are during the week two men were employed at the engines, one man at each, and at the week-end the management are asking that one man go down and attend the two.

25986. I understand that one man would be asked to look after two engines to see that they are all right. Does it occur often that there is nobody else in the mine except that man. It seems to me that it cannot occur very often. Are there not repairers doing some work besides this one man looking after the engines?—I do not know that I could give you any instance but this instance which is just at hand. Inasmuch as there is this case, we say there is the possibility of others coming, and we ask you to provide against the possibility of this happening.

25987. Do you not think it is a very rare thing for there to be only one man in the pit at any time?—Yes, I think it is a very rare thing.

25988. Do you make any complaint that the winding enginemen in your county are not competent men?—No.

25989. There are a number of incompetent men?—No, as a Trades Union, I think it has been seen here there is considerable objection in conforming exactly to our regulations. I said it was generally mutually accepted, but beyond that mutuality there are here and there objections, and there is friction between us and the employers, and we would desire that these precautions should be shifted from the authority of the Enginemen's Union to some other authority.

25990. (*Chairman.*) Do you mean to say, as a matter of fact, that there are men employed as enginemen in the county of Durham that have not a certificate from their trade union?—Yes, Hummerbeck Colliery, and the jury expressed the opinion that William Meynell was not capable of being an engineman. There are a few instances, but very few.

25991. (*Mr. F. L. Davis.*) There are some men who are winding enginemen, but who are not in your association?—I do not know that there are many.

25992. Do you claim that all the winding enginemen in Durham belong to your association?—I think we find there are 97 per cent. of the winders in Durham who are members of our union.

25993. What is the friction you referred to just now?—It may be that a manager of a mine may have fixed his mind on some man to be taught to wind that is not generally accepted by our people. He may not be a stoker, he may not be a boiler-minder, he may be some other man who has never been connected with steam practice, and we resent that, but a manager may think him a bright, intelligent man for all that and have him taught, but we resent it.

25994. You claim really that you want to have the nomination in your own hands of those who should learn to be winding men?—Yes, we do claim jointly, because the first condition that we lay down——

25995. Not jointly; your association claims to nominate all the men who wish to become winding enginemen. That is so, is it not?—It says here, in the first section of Rule 2, "he must have served at least three years in the capacity of some kindred employment, as firing, boiler-minding, or attending engines, and be of good moral character, steady habits, and possessed of good ability. Having first obtained the consent of the manager of the colliery."

(*Mr. Ratcliffe Ellis.*) He may have all that, but you have the right to say "No."

(*Mr. F. L. Davis.*) That is what I wish to put to you. You object to the management suggesting a man should be taught.

25996. (*Chairman.*) You consider it reasonable to say that a man shall not be taught engine-winding unless he has had experience before in the management of boilers or some kindred occupation?—Yes, we claim that.

25997. Why do you claim that? Why should not an intelligent youth be taught engine-winding?—Because we think a man trained by a kindred employment would be a man to give the least embarrassment to his teacher in charge of the whole machinery and the lives of the men, because a man cannot be proficient until he is trusted to draw men. Take that single instance. There comes a time when the teacher thinks, "I dare trust him with this cage of men," and he has to venture a trust; the management has not. Mr. Cooper, the lawyer for the North Owners' Association, told us it was a thing that the law had placed upon the men in charge, and neither the management nor anyone else could relieve the man from the liability, and there comes a time when he has to think, "I will trust him with a cage of men this time." If anything takes place the man that trusted him, and not the apprentice, is the man liable.

25998. Supposing an intelligent youth applies to be taught engine-winding. Three years before he can be taught he has to go into employment in a mine that has to do with boilers for three years. How can an intelligent youth of 16 years of age, if he wants to be an engine-winder, and his father is not an engine-winder, and he has not any connection with your association at all, but at the same time is intelligent and wants to become a member of your association in course of time, how can he begin? What steps must he take?—Supposing we were to undertake to teach such a one, and he is taught, and can efficiently manage the engine, then there are other duties enforced upon him as specified. Mr. Abraham, I think, read them; that he is to have charge of the boilers and the feed, and he is to examine the ropes and fittings.

25999. I want to know whether there is any restriction placed upon a boy seeking to learn all these things. I understand he must not only learn the winding, but also have three years' experience in the management of the boilers and things of that sort. If a youth of 16 says, "I want to know all about boilers and to be an engine-winder," is it possible for an intelligent youth to be certain at all events of taking his chance of that employment, or can your Association step in any say, "We have enough engine-winders being taught the trade and we will not have any more"?—The Mines Act prohibits young men working the engine. It says a person not less than 22.

26000. I want to know whether you seek to place any restriction upon an intelligent youth becoming an engine-winder in course of time after he has gone through the preliminary course you suggest he ought to go through. If he is willing to go in for a three years' course with a boiler and do everything to become a competent engineman, do you propose to place any obstacle in the way of his going in for that line of business?—No. As I said before, I do not know of a single instance the proposition has been made to us—I mean the Executive Committee managing those things in the county—where we have refused.

(*Mr. Ratcliffe Ellis.*) Your rules want a good deal of altering.

26001. (*Chairman.*) You would not in the least object to it being placed absolutely within the jurisdiction of the Home Office to have complete control over this question of teaching engine-winders?—No.

26002. That is to say, your Association would be perfectly content to leave it to the Home Office without any power on your part to refuse an application, to say that so-and-so must be taught in such a way that he shall be a competent engine-winder when he has finished his course?—That is what we are seeking.

26003. (*Mr. F. L. Davis.*) How do you teach one of these men? Will you tell me shortly? When he has got to the stage that he gets into the engine-house, how do you teach him?—After the coal-drawing is ended and we have lifted the men and there is a lull, the cages may be put by in the shaft. If we are waiting we would ask him to come to the handles, and we would stand by and direct him what to do, and the movements he made would be made between the alarm bell. There is a space, it may be three parts of the pit, between the alarms. We would keep him there and get him to run the engine, reverse it, until he felt what was needed. Then after we felt that the young man had a good idea and knew what to do and could stop the engine, we would give him fictitious marks and say, "Come to that mark and stop." We would practice by coming to a certain mark we had made ourselves. After we saw he had a good gauge and could manage the engine, we would venture him to come to bank, and thus we would lead him on by a process of that kind.

26004. How long would that take in the case of an average intelligent man?—I should think three months.

Digitized by Google

26005. While you are winding does he spend that time in the engine house watching you and watching the engine ?—If he is a fireman attending the boilers near at hand, it may be that he, if he has permission from the management to do it, may arrange his work so that he may come up during his own time and get those instructions, that is if his work will permit it. At other times, after going home and changing, he comes back to the engine-room. I do not know that there is any line that I could lay down as being uniform in this matter.

26006. (*Mr. Ratcliffe Ellis.*) Will you listen to this as a method of teaching ; " A boy comes to us when leaving school at 13 years or thereabouts and is put in the engine-house in the first instance to clean and oil the engines. He is there until 15 years of age, then he is put into the fire-hole under the stoker. He helps him in cleaning the boiler fronts and in looking after the donkey engine to feed the boilers. He is also employed to assist in cleaning the inside of the boilers. At 16 he is made assistant stoker with a little more responsibility upon him, he practically doing the same work as before, but without quite the same supervision. At 18, if he is found to be thoroughly fit, from previous practical knowledge of him, to take charge of boilers under the supervision of the engineman and machinery inspector, he takes a position of boiler minder : but, as a rule, he is much older than this before a place is open to him to take such a situation. Then if it is found that he is attentive and steady, with hearing and eyesight good, and physically strong, at the age of 18 to 21, if he is eligible, to be put to hauling and pumping engines. At 22, if he still bears a good character and has been apt in the performance of his previous duties, he is taught to wind at a winding-engine where water is wound (not men). He becomes thus qualified to take the place of a winder should a vacancy occur, but when such occurs, an experienced man is put with him in the first instance to get him into the way of the peculiarities of the engine. By the Act he cannot wind at all until over 22 years of age. It very rarely happens that a man so young as that is put to wind at even the least important of our pits. The youngest winder is about 28 years of age." Do you approve of that training ?—No. I could approve of it, but I would not suggest it as being a desirable routine of training. For instance, a young man may be partly apprenticed to some other trade or working anywhere : but there comes in his mind at the age of about 17 or 18 that he would like to be a winder. If he can become a stoker or boiler-minder for three years we would admit him on that, but this would suggest that a boy must choose to be a winder at the start, at 13.

26007. No, he is put to this work to begin with, and as he gets along, if he shows the aptitude, he blossoms into a winder. This is the method that is adopted at the Wigan Coal and Iron Company's works, where you went down in 1895, and said you must have the selection of those who are to be employed ?—Yes : we have not engines set apart for water drawing.

26008. That is what the management will do. They will teach him on a winding-engine for water where he cannot do any mischief. After you had been to Wigan, I believe they told you that they should retain in their hands the selection of the persons to be taught ?—The management ?

26009. Yes ?—Yes.

26010. Do you refer to that in your subsequent Conference, and does this appear in the Twenty-third Annual Conference of the National Federation of Enginemen Protective Associations of Great Britain, the President said ; " The Bill introduced by the Home Secretary on behalf of the Government omitted the whole of these provisions, and the Conference ought to deal with that." After some remarks on the certificates of Enginemen and Boilermen Bill already referred to, he said ; " They must seek the united support of all parties. Their force was a mighty one, and if well handled and directed, should ensure for them a brighter and better future." That is the power you are to exercise to prevent the manager nominating the men to be taught and placing it in the hands of the engine-winders ?—I do not deny it, but you can quite see that the Wigan incident had sprung this out of the groove that we had followed for some time, and there had been created some little feeling of resentment, and for the sake of comfort or something of the kind, we vent ourselves in this kind of way.

26011. (*Mr. F. L. Davis.*) You were telling me how you taught these men. Is it generally the case that the men who were learning really have other work to do, but they come and get their instruction in their own time ?—That is so, excepting if the work they are doing would allow opportunity or certain times of liberty.

26012. I suppose that is generally the case ?—That is so.

26013. A man cannot afford to be doing nothing. learning about an engine and earning no wages at all ?—No,

26014. Have you many landings in most of your collieries in Durham ? You were dealing with the keeps and people getting in and out by themselves. Are there any landings between the bottom of the shaft and the top ?—Usually about three, I think, two or three. I know in one place we have seven intakes, but many of them are just occasionally visited by officials—two and three intakes.

26015. From how many would there be coal raised ?—Not more than two or three—three at the most.

26016. Would there be men in charge there and men on the cage landing the coal and taking off the empties ?—Yes.

26017. At each of those landings there should be ?—There should be.

26018. Your complaint is, there is generally a man in charge but occasionally when there is no work going on the men are allowed to go on and off themselves ?—When no coal is being drawn.

26019. That is your complaint ?—That is it.

26020. Is there not a man at the bottom of the pit always in charge at night time in what you described just now as the least important shaft ?—No, not continuously —at some places, but not continuously. I should think in the majority of places there are men employed, but not for that purpose absolutely. A man may be giving attention to the furnace, or some other work near at hand, and at intervals where large groups of men are to be changed he may have instructions to attend the shaft to see a large group down, but between groups only a few men are riding, men doing repairs, and horse keepers, and nobody is there.

26021. Your complaint is that in some cases the Mines Act is not carried out properly ?—That is it.

26022. It does provide for men being in charge ?—It does.

26023. Your complaint is that it is not always carried out when the work is slack ?—That is the complaint.

26024. (*Mr. Enoch Edwards.*) Let us direct your attention to what seems to be made the crux of this business. In the Rules of your Society you have made special provision to satisfy yourself that these engine-winders are capable men ?—Yes.

26025. As a condition of membership of your Society you must be a capable engine-winder and understand the business ?—Yes.

26026. There is no reason except that he should be a capable man ?—That is all.

26027. I understood you to say that 97 per cent. of them were members of your Union ?—Yes, of enginemen in Durham in our Union.

26028. At any time in the history of your Society, has there been any other object except that these men should be thoroughly competent as engine-winders ?—I know of none.

26029. It is suggested here that you are rather seeking to be managers of the colliery. Is there anything in that ?—No.

26030. Has there been anything in it from the first, except that these men should be competent engine-winders? —I do not know of anything.

26031. When Mr Ellis put the question to you that you claimed the right to say no, you meant there, that so far as your Society was concerned, the man must be capable who was doing his work, and if he is not you say no, and it is on those grounds and those grounds alone ?—Yes.

26032. (*Mr. Ratcliffe Ellis.*) I should like that made clear. If he is a competent man you still claim the right to say no ?—Yes, if he is a competent man we claim the right to say no ; as a trade union we do.

26033. (*Mr. Enoch Edwards.*) You will resign your Rules in favour of any properly constituted body, such as the Home Office, if they will carry out the same functions as you carry out ?—Yes, but still I say that our Society would construct such Rules as would protect a man from being compelled to teach another if that man felt that he was not able to teach.

Digitized by Google

Mr. W. B. Charlton.

9 July, 1907.

26034. I understood you to say in reference to those, that there were men upon whom this condition of things produced a kind of embarrassment ?—Yes.

26035. That is to say, he is a capable engine-winder, but it requires all his attention and nerve to do his work rather than be interfered with by anybody else ?—Yes.

26036. He would not be teaching a man to drive an engine at a busy time when he was drawing coal and men ? —No.

26037. Then why is there the embarrassment ? There are men who are capable engine winders but not capable of teaching, for the reason that they become nervous if their attention is drawn away from their particular work ?—Yes.

26038. It is not because they object to the person ?—No, it is because the men are afraid.

26039. I understood you to say that the employers in the North had told your people that you are responsible if you have in charge a man you have trained; if anything goes wrong, you at the engine are responsible, and not the manager ?—Yes.

26040. Because of that you think you have a right to object to a man ?—Yes; it came about like this. The employers in the North said "Well, but cannot you do away with this restriction; cannot you do away with this regulation of your apprentices, and teach whom we nominate" ? and we said "Very well, we will, provided you will give us a writing of exemption from liability." They said, "We will do that; we will write out a statement that the man would be exempt from liability in the event of an accident when the apprentice is doing winding." When we had the next conference the exemption was read out, but it only exempted us from liability of fines in case of damages and breakages, and we asked, "What about the exemption from what might come to us from a coroner's enquiry in the case of death or injury" ? That exemption did not relieve us from such a liability, and because it did not relieve us from that liability we refused to have it, and Mr. Cooper was consulted and said what the law imposed upon a winder nobody could take off. If anybody was killed while an apprentice was doing the winding, the man in charge would be responsible and liable.

26041. It is because of that you claim your right to say no ?—That is it.

26042. (*Mr. Ratcliffe Ellis.*) With regard to the Rule of the St. Helens Association, "A member who teaches anyone the business of an engineman, unless he is his son or brother, or the son of another member of the Association, will be fined not more than forty shillings." Notwithstanding that Rule you still say it is on the ground of safety that the Rule is made ?—I confess that there are claims made by Trade Union societies that cannot claim very strong justification, and that is one of the strongest reasons that we should ask some other authority to undertake to manage this regulation.

26043. (*Mr. Enoch Edwards.*) If another authority takes this up on behalf of the Government, that is what you wish ?—Yes.

26044. Because in some way these men have to be trained for the work ?—Yes.

26045. With regard to hours, you have a system of three shifts of winders at the surface ?—Yes.

26046. You have not that below yet ?—No.

26047. The hours are much longer below ?—Yes.

26048. In these three shifts you have arranged it that the busy shift should be seven hours, the other eight, and the other nine ?—Yes.

26049. In practice you said if the man who should come on the second shift is ill and does not come, you intimate to the manager, and the third man would come on, and you two would work 12 hours ?—Or following what we do, eight in and eight out.

26050. Supposing a man is out through serious illness three months, what would you do ?—I have known a period of three months worked at that rate.

26051. You put in abeyance your eight hours system ? —No.

26052. Two men do it?—No. Where there are competent men in the colliery I should think generally a man is installed to fill up the vacancy where a long period is likely to occur; but if, for instance, a man's partner is only ill a day or two, or incidentally off a shift, or going away, then a man is not installed.

26053-9. You suggest you only temporarily carry on with two of you ?—Yes.

26060. You referred to a man being in a pit alone. You referred to enginemen and boilermen underground ?—Yes.

26061. There is no reference to the ordinary working pitman ?—No.

26062. Is it common for your man to be in a pit himself ?—No. There are isolated cases, I think. There is a time when water has to be got out, and at week-ends only.

26063. It would happen at week-ends ?—Yes.

26064. You suggested the working during shifts, and you have men in the pit all the 24 hours. I gathered you had that. On Sundays and week-ends you suggest the man would be sent to his pump himself ?—Yes.

26065. That is not a practice, to send a man by himself ? —At week-ends overmen, officials, go into the pit, and horse-keepers and repairers.

26066. He would go in with them ?—He might, but he might continue long after the others had come out. The winder may have other duties than winding, and may be kept there for the sake of other duties about the pit.

26067. Underground, I mean. You are not referring to the winder on the top being kept. It is the person being kept in the mine alone. This can only happen at week-ends, and then the men may look after the horses, and the men who make an inspection of the pit on Sundays like other days. They do not leave the pit to look after itself ?—It appears they leave it with this man only. This man is asked to attend to two engines 500 yards apart in the mine, with no one in the mine but himself at week-ends, and if it is possible in this instance then it may be possible to a wider extent.

26068. So far as I know, from my early boyhood I remember being a companion to a man who worked at a pit alone, and the practice was that a man would not be sent in a pit without some attendant; even the fireman who goes round the working places, would have some one in the pit with him. That was the custom in the Midlands, at any rate ?—Before I became a winder I was employed as pumping-engineman at one of the Durham collieries, and I have had a lad of 14 or 15 with me the whole of the time, but in this case they send no one.

26069. Is that typical of the custom ?—No, I say that is a very isolated case.

26070. (*Mr. Smillie.*) You are aware that this Commission has to enquire into the cause of accidents to miners and mine workers generally ?—Yes.

26071. You stated, in answer to Mr. Davis, that you had in some cases two or three landings from which coal was drawn in some pits ?—Yes, including the bottom.

26072. This is what is generally called mid-shaft ?—Yes.

26073. Have you any keeps in any of those mid-shaft landings ?—Yes.

26074. Do you approve of keeps in mid-shaft landings, as an engine winder ?—Yes.

26075. Are they not a cause of very serious danger to men who are being lowered down the shaft ?—No, I do not think so. I think if they are balanced to move clear they have the opposite effect. If mid-shaft keeps could come out automatically clear instead of falling in, there would not be a danger.

26076. When the cages were being worked in the shaft, would there at all times require to be onsetters at all the landings to make sure the keeps were in the proper position? —Yes, while the men were getting in and out.

26077. Have you known any serious accidents, either in your own experience, or have you heard of any, in the mining districts of the country, which have taken place by the keeps being placed at mid-shaft, the engine winder lowering his cage with men on it, not being aware that the keeps were in ?—I have not. I have an instance here. This is a mid-shaft accident as Bedside, where the man signalled himself away, and got into the cage, and the engineman was too quick for him, and he died.

26078. Were the keeps not there ?—No, there would not be keeps in here.

26079. You have been dealing with two kinds of keeps. You have mentioned another kind now, which would automatically be out of position when put into position by some person for that purpose ?—Yes.

26080. In a case of that kind the onsetter, when he wanted the cage to stop at mid-shaft, would put in the keeps ?—Yes.

Digitized by Google

26081. Is there any method of signalling to the engineman to let him know whether the keeps are in at the mid-shaft ?—I know of none.

26082. An engine winder might be lowering to a lower part, and those keeps might be put in ?—It would be the duty of the attendant at the top ; if he had men to get out he would name a seam there are men to get out at, say, the first seam down the shaft, and he would have a signal to give to the attendant to say that there were men coming at that seam, and he would also signal to the engineman that there were men for that seam, so that both the engineman and the attendant would know on this journey that there were men intended to get out there.

26083. Do you say that it is the usual, if not the universal, thing to have keeps, or shuts, at the mid-shafts in Durham ? —No, not in mid-shaft. I say on the surface.

26084. I have been dealing with the landings at mid-shaft where coals and men may be put on to the cage. Is it usual or universal to have shuts or keeps at those places ?—I do not think it is universal ; they are employed in mid-shaft, but not universally.

26085-6. Are you aware that mining engineers in collieries generally condemn the use of keeps at mid-shaft as being very dangerous ?—No, I am not aware of that. I know in one instance, this inquest at Boldon, where the jury regretted that the keeps had not been used ; that was an intermediate position between the top and the bottom.

26087. With regard to the keeps at the surface, would it not be simple for engineman to have charge of the keeps there, so that he could open or close them from the engine-house ? Is it not done in many cases when the banksman is away the engine-winder can, by drawing a handle, either close or open those ?—I do not know an instance of that kind.

26088. Would there be any difficulty in attaching to a handle on the keeps a chain, or some other method of the engine winder having charge of them ?—I should think that was possible. There would be nobody to signal to the engineman from the top in the event of anything taking place during the journey. The men would be running down and left there.

26089. You say sometimes men stepping off the cage at the surface lighten the load ; men might be getting on at the pit bottom, which might make the load heavier, and the engine winder, unless he had a strong brake to his engine, might go away ?—Yes.

26090. Is not an engine winders' brake in all the engines in the country sufficiently strong to bear any alteration in the load of that kind ?—No. Many of them are much inferior to that.

26091. Is it not the case that most brakes used on engines would almost stop the engine with the steam ? —No, that is not so.

26092. Would the keeps in that case you referred to do any good ? Would not the cage in which the men were coming off have a tendency to rise under such circumstances as you have said, and not to fall ?—Yes, it would have that tendency.

26093. The keeps in a case of that kind would not prevent such a thing taking place. Your strongest point is that it is a breach of the Coal Mines Act for men to ascend or descend the shaft without the banksman in the one case and the onsetter in the other case being there to see to that ?—Yes.

26094. If the Special Rule were made a General Rule and carried out you would have no objection ?—There would be no objection. We believe that the spirit of the law is that these men have to be there.

26095. Most of the Special Rules say that the banksman must be attending at such time as the manager appoints ?—I do not want to leave that point just now about the keeps. From what you say it is apparent that the tendency from the men getting in at the bottom and off at the top would be to move upward, but an efficient brakesman prevents that by steam. He is continually resisting that upward tendency. In the measurement of steam he might get an over-glut of steam, which would at the moment move the cage downward. If you had keeps it could not go beyond the point of getting out.

26096. (*Mr. Ratcliffe Ellis.*) The rope would go ?—Yes.

26097. But not the cage ?—Not the cage.

26098. (*Mr. Smillie.*) In a case of that kind if there were keeps in the pit bottom the cage must be at the lowest bottom, because the other cage is at the top ?—Yes.

26099. It is almost universal to have the cage sitting on a solid bottom or bins at the bottom ?—That is so. If there was on over-emission of steam, and the engineman had misgauged the resistance and moved it downward, the loosing of that weight on the keeps would be sufficient to arrest matters. I do not mean the man would send the engine away. I mean his giving resistance to the upward movement may reverse the motion and bring the cage down, but when it reaches the keeps it would be at rest.

26100. The chief point you have dealt with is the qualifications necessary for an engine-winder. Ninety-seven per cent. of your engine-winders are members of your union ?—Yes.

26101. Your Rules at the present time have brought about this position. Under the Mines Act you are aware that a manager is supposed to appoint a competent person ? —Yes.

26102. You say that the Rules under which your Trade Union has been worked up to the present time have given a manager a guarantee if he finds an engine-winder wanting employment and he is a member of your Association, that is also a guarantee that he is a competent person ?—Yes, he holds a certificate of competency.

26103. From your Association ?—Yes.

26104. You are anxious that the responsibility should be taken off your Association, providing a Government department sees that the engine-winders are competent by certificate ?—Yes.

26105. Is your Association prepared to face this position of matters, that a Government department, if the responsibility were put on them to grant certificates by Act of Parliament, might make provision for training engine-winders. Has it ever struck you that might be done outside altogether from engine-winders at your colliery being trained, that the Government department might make provision to train them to secure a sufficient supply ?—We do not believe that they could.

26106. Would you object to such a course being taken if it were proved to you that they did make them competent ?—We would object to our members being compelled to undertake to teach anyone contrary to their will if they were afraid of embarrassment and liability in consequence.

26107. You have dealt with that, and I admit you are correct to protect your own members, but I am putting a position where the training school might be established in some part of every county, where a training could be given outside of your Association altogether ?—That is possible if they sunk a pit and employed a staff and taught men all right, but if their regulations claimed the assistance of the enginemen, well, we would like to say whether we would undertake it or not.

26108. I quite admit your position there, but you are face to face with this, that colliery managers have to have a certificate at the present time ?—Yes.

26109. Have you ever heard of colliery managers objecting to the training of other people becoming colliery managers ?—No.

26110. There is plenty of scope at the present time for the training of colliery managers and granting certificates by the Government ?—Yes.

26111. And the Government provide examinations for these people ?—Yes.

26112. The Government to a great extent endow teachers by giving grants to teachers for teaching ?—Yes.

26113. So that the same thing might take place if certificates of competency were to be granted to engine-winders ?—In the case of managers' certificates, when teaching a man to manage a pit nobody has the liability a winder would have in case a man was killed.

26114. I want to put my position clear in order that you may grasp it. Mr. Ellis and his friends, rightly or wrongly, are of opinion that your chief desire in getting certificates is to limit the training of engine-winders, or that it might ultimately end in that. Providing that you are still to have a training, if the Government took the responsibility of granting certificates, it might also feel the necessity of making preparation for training engine-winders. In that case would your association object to engine-winders trained under the provision of the Government becoming competent workmen ?

26115. (*Mr. Ratcliffe Ellis.*) Not only would it limit the number but place in the hands of the engine-winders the sole right of permitting access to the mines. Do you think the rules would have to be altered if there was a satisfactory

Digitized by Google

Mr. W. B. Charlton. 9 July, 1907.

and recognised way of training enginemen?—Yes. The only provision we would seek to make would be to prevent any man who felt himself unable to teach another, being compelled to try.

26116. That would be a very important qualification, because he might refuse to teach anybody except those he thought fit to teach.

(*Mr. Smillie.*) Provision might be made for the teaching.

26117. (*Chairman.*) Do you suggest that the man himself should decide whether he was a man capable of working an engine and teaching at the same time, or that it should be left in the hands of your association?—In answer to that I will say our first regulations in this matter were like this: a young man could be taught to wind if he could find two men to undertake to teach him, one to propose and one to second. We feel that there is very much hinged on somebody having the responsibility of teaching.

26118. I want to know who is to decide whether the engine-winder is capable of teaching as well as working the engine. Is your association to decide, or the man himself?—The man himself.

26119. (*Mr. Smillie.*) Are you satisfied with the provision that a young man under a certain age cannot be appointed an engine-winder. It is Rule 24?—Yes.

26120. Is there an age limit beyond which a person should not continue to be an engine-winder?—We are very sorry to say that is very largely becoming so, although we know of no legal limit, but really there is becoming a limit—very much so.

26121. Have you known any cases in which miners have had meetings and protested against ascending and descending on cages because of the age of the engine-winder, whom they believed incapable through old age?—I have not known any case of that kind.

26122. You would not encourage the continuance of one of your members as an engine-winder after a period when it was thought that he was too old to do his work?—No; recently we have been making some very extensive changes in our rules for old members. This thing is becoming rather a big question, and we are making allowances out of our funds that we used not to.

26123. There is some age beyond which a person should not continue as an engine-winder?—It is a difficult thing. There ought to be a limit; a man ought not to be continued at engine-winding to the danger of anybody; but with regard to fixing a time I may say we have had men continue winding until 72. We have other men who after turning 63 were not competent to wind.

26124. There is no provision at the present time as to an age limit. There is a provision as to youth, but there is no provision as to old age?—Yes. It is like this, when a man has a long service time at an engine he gets accustomed to it—with considerable ease he manages his work; but if that man become discharged from that engine which has become a kind of second nature to him, he could not get work anywhere else, and that is how they get continued to a higher age than if they had to bid in the market for jobs. They would not get them. In the absence of accident they are continued to a great age, but I think if we fixed a limit that continuity would be broken.

26125. (*Mr. Enoch Edwards.*) The management are satisfied that these men are physically capable of going on with the work?—Evidently.

26126. (*Mr. Smillie.*) It is the men who have to ascend and descend who have to take the risk?—That is it.

26127. The number of men allowed to ascend and descend on a cage is increasing at many collieries because of the number of tubs drawn and the size of the shafts?—Yes.

26128. What is the highest number you know in Durham who may be on a cage at the same time?—24 in each cage.

26129. That is 48?—In the upward and downward journey.

26130. Would you suggest not only that there should be an examination as to a person's qualifications for an engine-winder, but also as to his health prior to his getting a certificate? Would you go further and say that there should be periodical examination of the engine-winders to find out whether their health was such as to enable them to continue as winders?—I think when we have deemed an examination at the start necessary and imperative that we could not object to a periodic examination, and I think, too, that it would be wise.

26131. Have you known any cases in which the engine-winder has had a fit or died at his work?—I think the next witness from Lancashire has a case in point where a man died at the handles: I have not known of one in Durham except one at Usworth a few years ago; the man was found dead in the engine-room.

26132. It becomes all the more necessary that great care should be taken as you increase the number of persons in the shaft at the same time?—Yes.

26133. There are cases where 72 may be on the cage or 144 in the shaft at the same time. In a case of that kind would it not be in your opinion a wise precaution to lay down by law that there should be two engine-winders in the engine-house while the men were being raised and lowered?—It would in the event of a man collapsing through heart failure, but it would not be of any value if a man by misjudgment at the point of stopping did something wrong, because it is so instantaneously given that nobody could intercept it.

26134. It is only in the case of heart failure, or anything of that kind?—Yes.

26135. Is there any method for preventing the over-winding of engines which you yourself have seen or know of?—Yes.

26136. For stopping the engine in the event of the engine-winder neglecting to shut off the steam?—Yes, there is a very effective apparatus at what is known as Mainsworths in Durham. I was there on some other matter and the engineer asked me to go up. It is a large engine, two 40-inch cylinders, and he sent the engine away full speed. About two revolutions from stopping, steam was shut off the engine and a steam brake applied, and the machine brought to a stand.

26137. (*Mr. Enoch Edwards.*) Automatically?—He put the steam on and went away and left the engine, and the speed acquired brought the apparatus into play.

26138. (*Mr. Smillie.*) Are you aware that that can be applied to any engines at present working at the collieries in mining districts?—I should think it could. To me it seemed a very plain and effective means of preventing it.

26139. Do you think it would be wise to provide by law that that or some other appliance of a similar nature should be made compulsory at all collieries where men are wound?—I do not know that such an apparatus could be applied in every shaft, but other arrangements could be applied in every engine; I mean, some of the shallow pits where there are only 20 or 30 fathoms. I do not think that this could be brought about. They would not secure the speed necessary to bring into play what was brought into play there.

26140. Independent of the speed at certain points where the steam is shut off, that automatic arrangement shuts it off. It depends on a certain point in the shaft where the steam is shut off?—The arms lift and bring into play and open some valve when it reaches a certain speed—the arms of the revolving governors.

26141. (*Mr. Ratcliffe Ellis.*) Is that Bertram's patent?—I believe it is.

26142. (*Mr. Smillie.*) If there were any mechanical contrivance would you say it was right to have it by law?—Yes.

Mr. THOMAS WATSON, called and examined.

Mr. T. Watson.

STATEMENT OF WITNESS.*

26143. (1) I am at present employed as agent to the Lancashire, Cheshire and North Wales Enginemen's and Boilermen's Federation. Our Federation contains about 1,500 members, chiefly colliery enginemen and boilermen employed in Lancashire, Cheshire, Flint, and Denbighshire. We are affiliated with the National Federation of Enginemen's and Boilermen's Protective Associations, and I appear as a representative of the latter, which consists of about 15,000 to 20,000 members

* Mr. Watson also handed in the appeal for legislation printed in Appendix II.

Digitized by Google

throughout the kingdom. I have had 25 years' practical experience amongst colliery engines and boilers, *i.e.*, 5 years as a stoker at boilers, 17 as a winder, 3 as surface fireman and machinery inspector. I afterwards spent 7 years as a colliery checkweighman, and during that time I acted as secretary to our County Federation of Enginemen and Boilermen, for which I now act as agent. I have also been the President of the National Federation from 1902 to 1906, and have been a member since.

(2) The points I wish to give evidence on are as follows: The want of legal restriction in the Mines Regulation Act as to the hours worked by colliery enginemen and boilermen.

(3) The responsible nature of their work.

(4) The custom as to the hours worked by these particular men in different counties, with special reference to Lancashire.

(5) The hours enginemen have been on duty when engaged in winding men during week-days.

(6) Week-end turns and the risks attaching thereto.

(7) Exceptionally long hours made by enginemen. Common to work 36 hours at a stretch. I have worked 60 hours at a stretch, and I know others who have done so. In one case we were told of a man who was at the colliery two weeks at a stretch. Fatal accidents: Westleigh, in 1896. Skelmersdale in July, 1905. Strong comments by the coroner; the mines inspector's opinion. Woodpark Colliery, Ashton-under-Lyne, August, 1906: coroner's comments. Other fatalities at Radstock and North Wales: coroner's comments. A very serious accident at Golborne Colliery, March, 1907.

(8) The same need for restriction of enginemen's and boilermen's hours at collieries as there is on railways.

(9) Where men work 8 hours they are, at all times, fresh and reliable compared with those working 12.

(10) Men's reports to me where engaged at continuous night work as to how they feel towards morning side when they have to deal with men going down.

(11) I am astonished that miners will tolerate it, as it is a miner's question as much as an engineman's, as the former's life is at stake, which is far more precious than an engineman's reputation.

(12) Nothing short of a legal 8 hours would give the necessary security.

(13) Employers make tempting offers when men attempt by combination to obtain 8 hours; *e.g.*, Lancashire in 1899.

26144. (*Chairman.*) The points upon which you wish to give evidence are, first, want of legal restriction in the Mines Regulation Act as to the hours worked by colliery enginemen and boilermen. Will you tell the Commission your views upon that?—So far as the present Mines Regulation Act is concerned, there is no restriction of enginemen's hours in any shape or form, and we find even the Government recognises that there should be restriction in railway men's hours, and we feel that there is as great a responsibility in the enginemen's hands as there is in the hands of any locomotive driver, and on those grounds we think that there should be some legal restriction. We have other grounds why we feel this. There is not a very large number of accidents due to this, considering the number of windings that take place, but we have had accidents where excessive hours are worked. Sometimes there have been cases where the enginemen have been on duty for 34 hours. I have a case in Ashton-under-Lyne where the man had been on duty for 34 hours when he overwound, killed a man and injured another slightly, but it was fortunate that they were not all killed.

26145. (*Mr. Enoch Edwards.*) Can you say how long ago that was?—That was on August 10th last, at Bardsley, belonging to the Chamberlain Colliery Company, Ashton-under-Lyne.

26146. (*Chairman.*) You give instances of excessive hours, and say it is common to work 36 hours at a stretch. What do you mean by "common to work 36 hours at a stretch"? I suppose you have your meals and a certain amount of sleep in the 36 hours?—It just depends upon what is going on. I have been on duty 36 hours at a stretch many a time, and not had a moment's sleep, particularly in cases where there are breakdowns.

26147. In cases of accident, I daresay, but that would be very seldom?—It has been a very common practice, particularly in Lancashire. I had better tell you the system at work in Lancashire, and it might assist you to gather the methods adopted. We have not 5 per cent. of the places but what are working something like what is known as the 12-hour shift system, and each engineman works 84 hours a week. In some of these places, to give themselves what is called an apparent short turn—the night engineman, who should come on at six, comes on at five, and releases the day man, but that throws 13 hours' duty on to the night man. Their time is supposed to be 12 hours all the week through, and at the week-end, to give a short day on Saturday, like other tradesmen have, the day man looses off at one or two o'clock, and the night man stays on from that time until seven o'clock on Sunday morning, and that is 17 or 18 hours. The system is brought about in the change of shifts, but it is natural where men are working night and day that they want a share of the day work, and there comes a time when the change of shift takes place. It makes it so that they have to work two turns to throw the man on the day turn into the night turn. We had a serious accident at Skelmersdale on July 2nd, 1905. The engineman had been on duty 17 hours. When this accident took place he was pulling the furnace man up the pit, and being in need of sleep he lost control of his engines, and dashed this man into the head-gear, and, of course, he went down the pit. The detaching hook failed in consequence of his pulling his engine up at the point of detachment before it thoroughly got through. But that is outside the question I want to convey to you. This particular man contended that he hardly knew what he was doing, and the evidence went to show that, and the coroner spoke very strongly about it. I have brought the report of the coroner's inquest with me on this particular case, and I think it would be worth while for this Commission to hear what was said on this occasion. This is the report: "Fall of 600 Feet.—Excessive Hours' Work.—On Wednesday, Mr. S. Brighouse, County Coroner, conducted an enquiry at Skelmersdale concerning the death of Thomas Ashurst, aged 51, a furnace tender, of 30, Moss Lane, Skelmersdale, who met with a shocking death at the seven-feet mine of the White Moss Colliery Company, Skelmersdale, on Sunday morning. Robert Arnold, engine-winder, said that at five minutes to five on Sunday morning he received a signal from deceased (who was the only man in the pit) to be wound up to the top. There was an indicator to show when the cage was coming to the landing place, and a bell rang when the cage got a short distance from the top. Witness thought the cage was not quite landed and put on steam. He afterwards should have reversed, but did not do so, and the consequence was that the cage went to the top. The rope broke, and the deceased fell down with the cage into the dib-hole, a distance of over 200 yards. In reply to the coroner, the colliery officials said they had never known the apparatus to fail, and it would not have failed in this instance if the witness had not been trying to remedy his mistake Witness, in answer to Mr. Matthews, His Majesty's Inspector of Mines, said he had then been on duty 17 hours, and had three more hours to work. He did this shift of 20 hours every other week-end. The Coroner's Strictures.—The coroner commented in strong terms on this fact. He said he did not care if the shift was only once a year. It was against human nature to call upon a man to do it. He had a strong opinion that a great many accidents occurred through calling upon human nature to do more than it possibly could do. It would not be allowed in a signal-box on a railway, eight hours being quite sufficient there. He did not care whether there was only one man in the mine or not. His life would be considered in the same way as if there had been 5,000 down the pit." Then we have the evidence of the manager: "Mr. Paul Lea, manager of the colliery, said the reason the man worked 20 hours at a stretch was in consequence of an arrangement between the two winders, so that they could have a Saturday off every other week. It was a common custom in collieries, and was an arrangement with which the Company did not interfere. The coroner thought that another man might be brought in to change the shift." The next witness is Thomas Whalley, a stoker, and this will convince you that the man did not know what he was doing: "Thomas Whalley, stoker, said he was standing near the boilers when the winder shouted out, 'Oh, dear! I have fetched old Tom up, and he has gone down again. Am I asleep, or am I not?'" That is a nice state of things for a man who is in charge of winding. "Only a few minutes previously he had seen the winder take a short walk by the reservoir. After the accident he seemed terribly upset. Edward Williams, surface manager, said it was customary for the winders to have a 'nap' now and again. He had had to knock them up to waken them.

Mr. T. Watson.

9 July, 1907.

The coroner said it was harder to keep awake when doing nothing than when working, after so many hours. The winder (Arnold) was stated to be a very steady, reliable man, and that it was his first mistake. The jury returned a verdict of accidental death, and expressed the opinion that the Colliery Company should not allow the winders to work so many hours at a stretch." In connection with this particular case there is the Report of the Government Inspector, Mr. Hall, which deals with it, and he seems to come to the same conclusion as the manager, that these long hours worked at week-ends are simply for the convenience of the enginemen. I do not want to find any fault about the action of our inspectors. I think we have as good a staff of inspectors as it is possible to get; but, after all, I do say this: In connection with these excessive hours, I think a little straighter and a little more outspoken talk would be better on their behalf, and the recommendation of some restriction, because when we find a system which allows a colliery manager to permit men to work up to as many as 36 hours—and I have worked 60, I may tell you—that is a clear proof that there should be something in the Act to put some restriction on this particular class of men.

26148. Under what circumstances did you work 60 hours at a stretch?—It was in consequence of having no one to relieve me.

26149. Owing to sudden illness or what?—No, it occurs in this way. As a rule at collieries they keep a bare staff of men and if one falls off bad the other men have to do the work amongst them. Sometimes if there is an extra job it may mean men having to work extra time. The idea in my mind is this, that that should not be tolerated. They would not allow a man to be on duty that length of time on a railway under any circumstances.

26150. When you were made to work 36 hours, which is an extremely long time to be on duty, you say that the usual reason was that there was some accident?—It may occur through accident or through the man that mates them not attending to his work.

26151. Under ordinary circumstance you have to work once a week at least 24 hours?—That is so—once a fortnight.

26152. You would have to work that length of time without any accident or any reason. At the end of that 24 hours, or some time before, you did not feel specially competent to perform your work?—That is quite natural. In this particular business the work may not be heavy and laborious, but, after all, it is of a tedious and fatiguing nature, and you are generally in an atmosphere that is not anything to compare with the atmosphere in this room. The effect of having all this responsibility of the men's lives on your shoulders is to weary a man to the extent that when he is getting to the time when he has to deal with the men, I say he is not what he ought to be. When a man has been on duty almost the full length of hours, that is the very time that he has to take in hand the lives of the men. Take a man who goes on day duty at six o'clock in the morning and stays on until five o'clock at night. After he has had a good hard day's work, close on three or four o'clock, when he is worn out, he has to deal with the men—just the most important part of his work to do when he is least capable of doing it. Then take the night man when he goes on duty at five o'clock at night he stays on all night. In some places they are not hard-worked, but in some places they are as busy as in the day. With a night man he does not get the same sound sleep in the day, and he is not as efficient to do the same amount of work in the night time as in the day time. These men, after spending 13 hours at the pit during the night, have to set to the last thing in the morning to let 500 or 600 men down the pit, and we have had some very narrow escapes in this business: in fact, we had a serious accident at Westleigh in 1896, where the engineman had been on duty 13 hours: instead of letting down eight men he had in the cage, he took them into the head-gear and the detaching hooks in that case failed altogether and the men were all lost.

26153. Why did the detaching hooks fail?—In consequence of being out of order. That is an argument that they ought to be kept in order as well: but, after all, the man had been on duty 13 hours. We had another case in September, 1903, where we had an engineman at Astley and Tyldesley. He had been on duty 13 hours, and as his brother was going into the engine-house he fell backwards and died, and he managed to get the steam brake on. That man had 24 men going down the pit with 500 yards to run. If he had not had time to apply the steam brake what would have been the consequence? There would have been 24 more deaths as well. We have had other cases. We have had about three to my recollection within the last six years, where the engineman has been found dead in the engine-room in that fashion.

26154. Three altogether?—Two besides the one I have mentioned. There was the case of Joseph Whittle, at Wigan Junction, in about June the year following, when this man died at Astley and Tyldesley about June, 1903. Then we had Jabez Mann: his death took place——

26155. At all events you have had three deaths?—We have had three deaths within the last 5½ years.

26156. I suppose you had inquests in all those cases?—Yes.

26157. Did the inquests show that by examination of the men you could have found out that they were unfit to do the work and liable to sudden death?—In these cases the verdicts were all brought in as deaths from natural causes.

26158. Were the diseases from which the men died suddenly such as could have been found out by medical inspection?—The report does not give that. I have the report of the inquest.

26159. Does not the report say anything about that?—Take Jabez Mann's case at the Yew Tree Colliery. I will give you the date in a moment.

26160. I should like to know what the verdict was?—In his case the verdict was that he died from an apoplectic seizure. He had been on duty only four hours when that occurred.

26161. That could not have been discovered by medical inspection. The doctor could not have said he was liable to apoplexy?—I am not so versed in medical science as that. Some people contend that apoplexy would arise from a heart disease or being out of order. In that case it was attributed to an apoplectic seizure. In the case of Joseph Whittle the verdict was a similar one. You cannot claim that it is in consequence of these men being on excessive hours at the time they died, but it shows the responsible position they hold and the great risk they run, and that even if they have been on only four or five hours when things of that sort take place, we do not know how much of the remaining portion of their week's work may have brought them down to that low state when collapse comes on. With miners it is common for them to wish for Friday night: they could not keep on another week without the rest. The same applies to enginemen working excessive hours: they gradually grow worse near the week-end. What I wanted to call attention to with regard to the Skelmersdale accident was this; Mr. Hall states in his Report that it is a matter that rests more with the enginemen, and it is for their convenience that the turns are changed at the week-end. I want to ask the Commission this question; if men are tied down to work 84 hours out of a possible 168 the clock goes during the week, does it not mean if they are to change from night turn to day turn that they will either have to work long turns or otherwise be off at shorter intervals, and both are objectionable when men get into that tired state?

26162. Have you considered the question of mechanical appliances to assist an engineman doing his duty, so that it will not so much matter whether he makes a mistake in winding? For instance, with regard to ~~kepts~~ keeps. Do you think there ought to be a regulation with regard to kepts being in a position to be worked?—Certainly, they are a necessity, but there is a difference of opinion as to their use. For my own part I believe in kepts at the top and at the bottom, but I do not believe in their being in use in the centre of the pit.

26163. Why not?—We had a serious accident in St. Helen's district a few years ago and eight lives were lost. They had kepts at a mouthing in the pit and they worked a semaphore in the engine-house. When these kepts were out ready to receive the cage, the semaphore was out before the engineman, and there was a signal that you should not go there, but the signal failed on one occasion when the kepts were out, and he was dashed down with a lot of men and they were all killed. I think they are dangerous to have in the middle of a shaft. To meet that difficulty they want an adequate brake, one that will hold the engines equally as securely as the kepts themselves.

26164. It has been suggested a difficulty may arise owing to the engineman not knowing how long to wait before he raises the cage. If he waits too long the man will think that he has given the wrong signal and step out when it is being raised?—I like kepts at the top of the pit in particular for this reason. I have had about

Digitized by Google

25 years' experience amongst engines and boilers and in control of them. I have had to do with kepts and without kepts, but as a rule when you are lowering men where there are kepts, I have always found you were less liable to start off with a wrong signal and do more damage than you would if there were none for this reason. When you are at an engineman's handles, the men come to work, in the morning and run about the engine-house and shout, and you get false alarms, and if there are no kepts you are likely to start with a false alarm when men are getting into the cage. If there are kepts he cannot do any damage to these men so long as they are under the cage until the browman is ready. We have some places where the browman keeps charge of the kepts and we have others where the enginemen manipulate the kepts as well as the handles. I think that is a failing, because a man, if he has control of his kepts as well as his engines and starts under the assumption that he had a signal when he had not, would start his engine off and pull his own kepts from under, and it would be better if the kepts were in independent hands. In that case there would be two strings to the bow to prevent an accident.

26165. You are in favour of kepts being at the top and at the bottom and not intermediate ?—Yes.

26166. Would you also say that there must be a bottom man to see that the kepts are in order and manipulate for himself ?—That is so ; at some places they have the kepts at the bottom and not on the same footing at the top. At the top they fall under the cage themselves ; at the bottom they fall out. They have to be pushed under the cage ; that is the difference. If they were to be neglected they would have fallen clear, and if he wanted to let the cage sit on them he would have to push them under.

26167. You do not in your statement say anything except about hours. You do not make any suggestions as to certificates being necessary ?—I have given evidence upon this question before the Select Committee in 1901.

26168. You would like to refer to your evidence there ? —Yes, my evidence there is my opinion upon that particular point.

26169. You simply refer to that evidence ?—Yes.

26170. It there anything else you would like to say ?— There are several other questions besides these kepts. The question of hours I have not gone into as fully as I should like to. I want to point this out to the Commission, that this is a most responsible position, and it is a great responsibility on the Government in neglecting to put them on reasonable hours, and particularly not to have any restriction whatever on their hours. Take the number of miners ; from the miners' standpoint they have to descend and ascend under these men's hands once every day, and it means a matter of nearly 800,000 men. When you examine and find that these men are put under such risky conditions of riding up and down, being wound by men who have been on duty 12 and 13 hours, I say that it is a national crime to permit it. When you look at the question on Monday morning as a rule there are about half of the enginemen in the United Kingdom that are working 24 hours at the week-end. In Lancashire three-quarters of the men work 24 hours at the week-end. You have all the miners throughout the kingdom going down on Monday morning week in and week out under men who have been on duty for 24 hours. It is a matter of nearly 800,000 men going down on Monday morning being wound by men who have been on duty for 24 hours. I think it is a serious thing and ought to receive the strictest attention in any alteration that is made in the law. There are some employers who are very good and have met this question. In Durham they have had the eight-hours principle at work since 1872. In South Yorkshire they have it at some places, and also in West Yorkshire they have it at some places, and in North Staffordshire they have it as a custom. In Lancashire it is only here and there, and so far as the hours are concerned there will be no remedy until the Government takes the matter in hand and puts its foot down and says there must be a limit to these hours. In Lancashire they have been anxious to get it, and they have worked themselves into shape. In 1899 they worked themselves up to that pitch that they intended to have it if it meant a strike, and they put in notices. All the enginemen in the county served their notices, and it went to the extent of being about 24 hours short of all the pits being stopped, when of course there were tempting offers made which they could not resist, and it broke up, and since then there has been a still more bitter prejudice against the eight-hours system amongst employers than there was before, in consequence of the inconvenience it would cause to them. I think that something should be done not only in the interests of this particular class of man, but in the interests of the miners whose lives are entrusted to their care.

26171. (*Mr. Enoch Edwards.*) Could you say why you have so arranged that men should always have to go down when a man has been on so long ? Why could not the new man be there and let the men down in each shift ? I mean why could he not start his work by letting the men down ?—The position would be better if the men were put on at eight hours and should always be fresh.

26172. Even with that you would have the same difficulty ?—We have had accidents even when a new man has just come on duty. He has perhaps not been as good as a man who has been on an hour or two. The sole remedy for this business is eight hours. We have men working eight hours and they can go to their work at any turn and are always fresh and feel in good condition, but if you talk to 12 hours men—I have some in St. Helens who are busy during the night time and they tell me that at 2 or 3 o'clock in the morning they scarcely know whether they are standing on their head or their heels. That is not a fit state for men to be in who have to handle 400 to 600 lives. If there is anything serious taking place the enginemen under those conditions could come on sooner. It is a recognised custom with all classes of people that 6 o'clock is the time to go to work in the morning, but there are exceptions.

26173. The collier would have to go before six ?—There are exceptions when the men go at 5 and 4. It would mean that they would have to go on at 5 to meet the difficulty. That does not meet the difficulty of shortening the hours. Anyone will admit that 12 hours is too much at this work, and if they work 8 hours, whether they go in at 4 or 5 o'clock, they are always fresh.

26174. It is not necessary as a matter of arrangement whether it is 12 hours or 8 hours. It is not necessary for the man to be on all those hours before he lets the man down. It can be arranged that he shall be fresh when he lets the men down ?—That is so, if you do that.

26175. You could do that in 8 hours just the same ? —The colliers' hours are not 12. If a man goes in at 5 o'clock in the morning on purpose to deal with these daymen, his mate should come, by virtue of the system, at 5 o'clock at night to liberate him. That man that went in at 5 would let the men down in a fresh condition, but he would bring them up in a worse condition at night.

26176. The other man would be there ?—He would have to be on a matter of 13 hours and come in at 4 o'clock. He would have to come in two hours sooner, because they start coming up at 3 o'clock.

26177. If he had 8 hours it would be better for a man to go on fresh to handle men ?—If you come into conversation with the men, I do not care how busy they are, they will tell you that they always feel fresh every hour that they are on duty if they are 8 hour men, but an ordinary engineman working 12 hours in and 12 hours out, and he is working four hours more and he has four hours less time to recuperate, and he gets into a worse condition at the week-end than a man who is working 8 hours.

26178. (*Mr. Ratcliffe Ellis.*) In Lancashire the hours are 12 hours ?—Yes, as a rule.

26179. That is the maximum ?—No.

26180. The change at the week-end makes it so that a man is on duty for 24 hours ?—Yes.

26181. If he works longer than 12 or 24 hours it is because some accident has happened, either his mate does not relieve him or some exceptional circumstance ?—Yes.

26182. Do you think that 12 hours is too long ?—I do at that particular class of work.

26183. You fix the time of efficiency at eight ?—Yes.

26184. That of course is a question of opinion ?—That is so.

26185. The man on night duty when not winding coal in the night has nothing much to do ?—It just depends. In Lancashire in particular there is a deal of dirt winding and in some cases water winding. In some places they have to take charge of their boilers. There are some few places where they are worked equally as hard as in the day. but as a rule it is a little bit easier at night.

26186. Can a man do that work for 13 hours. There is a difference being on duty at night, when there is very little to do, and being on duty in the day when a man is occupied the whole time. Would you draw no distinction between the two ?—No, I should not, because there is a very large proportion of the pits where there is something going on now, either dirt winding or letting timber down, or something like that.

Digitized by Google

Mr. T. Watson.

9 July, 1907.

26187. What is going on during the working shift?—That is so. As I explained, those particular men being on night turn, and not having their natural sleep, are not as capable of doing a night shift of 12 hours as a day man who works 12 hours and gets his natural night's sleep.

26188. At any rate, you would make no difference?—Their standard of vigour and efficiency is of a lower rate during night work than day work, and any workman in the country will tell you that.

26189. You draw no distinction between the two?—No.

26190. There should be no more than eight hours in a shift?—No.

26191. Mr. Edwards has asked you with regard to eight or twelve hours' shifts, whether it is not a matter of arrangement so that the tired man should not put down the men in the morning?—That is so. In an eight hours' system with all the men I have spoken to—there are thousands of them, but not in our county, I wish they were—they always tell me it does not matter whether the men come at the beginning or the end of that shift, they feel reliable and have confidence in themselves.

26192. You have been an engine-winder?—Yes.

26193. You say from your own experience that is so?—Yes.

26194. You feel tired, and you think that 12 hours is too long a time?—Yes.

26195. The character of the engines has been improved in late years?—Yes.

26196. So that there are more mechanical facilities?—There are, but after all, with all these facilities there are none that are as perfect as a reliable man. There are certainly checks and preventives, but it would not do to depend entirely upon them, the attention of the man is required.

26197. But still, mechanical facilities are of much greater assistance than they used to be?—In following up his work they are there, and to a great extent some of them are reliable, but not completely, and a man has to be as alert with mechanical appliances as he has without them.

26198. Do you know Bertram's patent?—Yes.

26199. It is in use at the Wigan Coal and Iron Company?—Yes.

26200. What do you think of it?—A very good patent, and one likely to prevent a lot of accidents. We are acquainted with Bertram's patent, and know that it can be made to fail. We can point out conditions under which it would fail.

26201. It does not put any undue strain on?—Not as a rule.

26202. It gradually slacks the speed without any jump?—Yes, generally.

26203. You think it is a good thing?—I think it is a useful thing, but after all you want the attention of the engineman. There is this in connection with all the patents we have seen. The load for an engineman to handle is of a variable nature. He may have two tons at one time, five hundredweight at another time, or one ton going down. These mechanical contrivances are safe under certain conditions, but they do not meet all the variations in the load.

26204. You do not object to having him assisted so far as possible?—Certainly not.

26205. You think Bertram's patent is a useful apparatus?—I believe it is very useful and has done a lot of good, and may have saved a lot of destruction, but the engineman's liability and responsibility, and the care and caution required about his work are just as heavy as they were before.

26206. When you gave evidence before the Select Committee you gave your views as to certificates?—Yes.

26207. Do you think it desirable that there should be an examination for enginemen, and that they should be certificated?—I do.

26208. You would go to the extent of saying that no person should be allowed to wind up or let people down a pit who is not a certificated winder?—That is my view.

26209. How many winders are there in the kingdom, do you suppose?—I could not tell you the exact number, but I should think there would be a matter of 5,000 or 6,000.

26210. That would be the very outside?—Yes.

26211. In order to get the certificate a man must have experience: he must be taught by somebody?—That is so.

26212. Are you aware that any difficulty is made by enginemen in teaching the men?—There are certain rules in different societies of a stricter nature than others. The first principle with regard to certificates from my standpoint is this. If there was a new staff entirely wanted to-day there are sufficient already in the field to fill those positions. The question of learning and the methods adopted are only a secondary question. The first question we want to ask ourselves from a national standpoint is this: Will it give greater assurance that the men at the handles are a class of people fit for that particular work?

26213. The rule of the St. Helens Association of Colliery Enginemen is: "A member who teaches anyone the business of an engineman, unless he is his son or brother, or the son of another member of the association, will be fined not more than forty shillings." Is that a rule they have?—Not at present; that has been revised. You have an old copy.

26214. What is the present rule?—The present system is this; they naturally, the same as every other class of man, cling to their own brotherhood, and give them the preference if they can. Assuming I am working at a colliery, I may not be related to a member in St. Helens—I happen to be general secretary for the county, but if I am not related to any member and I was a winder for a hauling engine, and there was a vacancy, their rule is this: if a man has a preference for the job he has to be instructed, no matter what the relationship is.

26215. Do you agree that the manager may require the engine-winder to teach a man or teach a boy?—That has been attempted.

26216. Do you agree that it should be part of the engine-winder's duties to teach anybody sent to be taught by the manager of the colliery?—Not exactly. My idea is this: if I have brains to give away, I want to have some choice whom they shall be given to.

26217. Do you say you are to be the judge as to who is to be taught?—The manager of the colliery finds the machinery to practice on, and they like these men being instructed because as a rule they have given them something, they have given them a trade, and they can deal with such persons easier from the manager's standpoint.

26218. Is it your view, on behalf of your society, that you and you alone must decide who is to be instructed?—No. I will give you the Wigan Association rule, if you like, on the learning question. I think Wigan has been looked upon as one of the most clannish and selfish class of engine-winders in Lancashire, but they even go so far as to make this provision, that, in the event of there being a scarcity of enginemen, that they will confer with the colliery manager as to who is the next best person to be learned.

26219. Is this the rule: "No member of this association shall be allowed to instruct any person in the business of engine-winding so long as there are competent persons of respectable characters who are out of employment, and who are members of this association; but if there are no members out of employment, then the committee shall have power to confer with the management of collieries with a view to the next best person to be learned or instructed. It shall be optional for a member to instruct his son, if he deem it necessary, for the purpose of making him a competent winder only, but a member's son shall not have preference of a vacant situation before a member of this association. If it be proved on the testimony of two witnesses that this rule has been violated by any member (after the issue of these rules) such defaulting member will be expelled from this association." Could a colliery winder, as a member of your association, teach a person sent to him by the manager who was not a member of your association?—No, and a colliery manager would have no right to do that, because when that manager is sending a man he is giving the use of the engines, but the engineman ought to have the control as to whom he is going to give his intelligence to.

26220. If you had your way a man could not be taught to qualify for a certificate unless he was a member of your association and had your sanction? Then no person can get into the mine who has not got a certificate, so that it would practically place your association in command of the gate of the mine?—I think that is meeting the ghost before we get to the churchyard.

26221. Is not that the effect of it?—It is the possible effect, but the very improbable effect.

26222. Supposing that scheme was carried out, you suggest you could prevent, if you chose, a mine-owner going into his own mine?—It is within the limits of men's

Digitized by Google

capabilities to prevent mines being worked at all, for that matter, but we are supposed to exercise good judgment and common sense and plenty of conciliation.

26223. You have to be the power to exercise the judgment ?—No. In my own particular case, and this is given with all these restrictions—I know you have possession of a lot of these rules at different branches, but with all these restrictions you do not find any scarcity of engine-winders in our county.

26224. You are the person who has to exercise his common sense. I will put it plainly to you. In case of some disturbance between the owner and the men you think that you should be entitled to say whether the mine owner shall go into a pit without your sanction ?—It might ultimately work into that shape under some extraordinary condition, but I say that it is not practicable.

26225. Is it a reasonable thing that there should be any legislation which might result in that ?—If I thought it would lead to that I would not advocate it, but I say that it is very improbable that it would ever lead to anything of that sort. There is the other aspect of the question that we want to look at. You say it does not matter to me whether the owner of the colliery thinks the engine-winder capable or not. I insist on a man making himself capable before taking up that position. You have proof from an independent authority that a man is a capable and reliable man before he is appointed a colliery manager. You say that that is giving you a better class of colliery managers. Our contention is that it would lead in the same direction in bringing about a greater state of efficiency in colliery enginemen. At present a colliery manager can put an engineman on ; it does not matter if he has a qualification or not, if he is prepared to take the responsibility. There are not many who will accept the responsibility, but there have been cases where they will, and a manager can put at the handles anybody he thinks fit. A colliery owner cannot put on anybody he thinks fit as a manager, because the Government say, "We want a voice as to whether that man is capable or not."

26226. Supposing there is an examination by the Home Office to secure competency in a man, would you say it was reasonable that the manager should be entitled to require engine-winders to teach any person he may send to be taught and qualify for the certificate ?—I should say certainly the manager should have a voice, and the man who gives the intelligence ought to have another voice, and it ought not to rest entirely with the manager.

26227. Is the voice of the man to be "I cannot teach this man" ?—He has or ought to have a voice in the matter. It is the same in my business as in that of any gentleman sitting round this table. We all please ourselves whether we will teach anybody our trade.

26228. The engine-winders are a class of men 5,000 in number, and they practically have the control of the engines of these mines. You agree with that ?—They do not claim to have the entire control.

26229. Supposing you say "I will not teach this man," then he cannot qualify. He must be taught, and if you say that, it really places in your control the gate of the mines of this Kingdom, an association of 5,000 people, but there are over 800,000 people engaged in the mines, and I do not know how many millions of capital, and you think that an association of 5,000 people should have a right to say whether these mines shall be entered or not ?—As far as this is concerned there is this feeling amongst this class of men, that there has never been a scarcity of enginemen.

26230. You will not answer my question ?—Allow me, we want to look at it from both sides. I will admit, for argument's sake, that the whole control of making enginemen would be in their hands, if that will satisfy you. It is in their hands now without certificates.

26231. No ?—Exactly so.

26232. You say, notwithstanding that there might be an examination by the Home Office, so as to secure that there should be no question about a man's qualification—— ?—It is the principle of an examination.

26233. Notwithstanding that there should be all that care taken, you think you should still have the right to say whether a man shall be taught or not ?—I contend this, and I want to be honest in the matter. The men who have anything to give away in the shape of knowledge ought to have some choice in the matter, whatever vocation they may be in.

26234. You have in your rules a payment to be made ?—In some of the Branch Rules.

26235. That does not satisfy you ; you must not only be entitled to receive payment, but have the right to decide to whom you would give it ?—That may be in some instances, but the principal of certificates—I wish this question of learning and the future difficulties were made into a little less bogey than they really are.

26236. It is easy to do that by saying the manager shall have the right to send a person to be taught on payment of a certain fee ?—That is so, but the manager ought to charge for his own brain and not other people's.

26237. If it is not your object to have the control of these men, why put this difficulty ?—We are not wanting to put a difficulty, and I wish to disabuse this Commission's mind of this. In asking for certificates, it is not to create a corner in the business of engine-winding.

26238. If that is not your object, why object to a right to send a man to be taught ?—It becomes a secondary question. That is the first consideration, that the nation should be sure that we have capable and qualified men at those jobs, with an additional proof, apart from the manager's choice, that they have undergone some examination, and that they have some technical knowledge.

26239. The examination question I am not disputing ? —That is what it would lead to.

26240. Supposing there is an examination by some competent authority to satisfy the men that the man is a competent winder ; if it is not your object to make a corner, why do you object to the manager having a right to say to an engine-windor "You must teach this person his business" ? You make a certain rule that there shall be a payment of £5, and for that payment you must teach this man ?—Take, for instance, the creation of colliery managers ; they claim the same right, and they charge premiums, but still there is no corner in that business.

26241. If it is not your object to make a corner and secure that no person shall be a winder who is not in your association, why do you object to the manager having the right to send a person to be taught, if he pays the fee ?—I object to the manager having the right. He may be the manager of the colliery, but when I come on that colliery as a practical engineman I take my brains and knowledge with me, and I claim to have the sole control over them as to who I shall give them to. That is my idea. I am prepared to confer with the manager, and I wish to assure you that we have no desire to create a corner.

26242. Your conferring would be to say, "Very well, I shall not have him" ?—I say that the man who has the brains to give them should have some choice who he is going to give them to. In this business colliery managers have certificates, and it has not created a corner with them. The marine engineers have to pass an examination.

26243. There is no association ?—There are associations in both cases.

26244. No association which limits the persons who can be taught. However, we cannot get any further with that ?—No. Of course on the learning business I think, speaking generally, that there has been far too much made of the difficulty which would be experienced in getting men after they have certificates than there is any need for. I think there would be no difficulty. It would bring about a system of men fitting the groove they would have to fill. Now it is in a loose and disorganised state.

26245. Do you think it desirable that in a Bill there should be a provision enabling the Home Office to approve people other than those with certificates in case any difficulty of that sort did arise ?—I should, certainly, allow the Home Office to draw up its rules.

26246. I want to go further than that ?—It could draw them up in such a state that if exceptional circumstances arose there ought to be exceptional provision made. I do not see that they ought to risk a man's life or even a mouse's life in carrying out what they feel to be their strict rights.

26247. A very limited number of men in comparison with the great number employed in the mines might have control of these mines and prohibit the owner getting into his own mine ?—I think you are making rather more of that point than what there is in it.

26248. What difficulty have you in saying by all means let the manager send a man to be instructed ?—I say, by the natural state of evolution, if this question of certificates was looked at by the Government in a right way and as a security for having good men, and it were adopted, the other evil you fear most would gradually be met as they approached it. Instead of that we are going to it direct.

Digitized by Google

Mr. T. Watson. July, 1907.

26249. (*Mr. Wm. Abraham.*) Do you know any case where the Enginemen's Society have prevented any owner getting to his colliery?—Not that I am aware of.

26250. Do you know any case where the Enginemen's Association have prevented a sufficient number of winding men being trained?—We have never experienced a difficulty in all my time for men. In Lancashire to-day, where I am, if there is a vacancy there are generally half-a-dozen men for the job.

26251. All these questions put to you are with regard to things which are problematical?—Yes.

26252. You have nothing in fact, to prove that it ever existed?—That is so.

26253. What time in the morning do your men commence going down the shaft?—As a rule, in our district, they generally commence to go down about five or ten minutes to five, and they are going down until six o'clock.

26254. Ten minutes to five?—From ten to five they are going down until six o'clock, as a rule. They cease to give them lamps about ten to six, so as to have all the men on the pit-head, and have a clear start at the coals at six o'clock.

26255. When do they come up?—In our district the hours of the miners vary slightly.

26256. (*Mr. Enoch Edwards.*) What do you mean by "our district"?—Lancashire.

26257. No particular spot, but Lancashire?—That is so. I happen to reside in Lancashire. I do not know about the miners all over the county, only the enginemen, because it is out of my province, but I know about it to some extent. As far as the miners in our district in Lancashire are concerned, they are supposed to be down from six o'clock in the morning to four and some up to five o'clock at night. We have collieries where the men are going in at five and ten minutes to in the morning, and come home at half past four and twenty to five at night, almost twelve hours, and not ten minutes' walk off the colliery.

26258. (*Mr. Wm. Abraham.*) As a rule nearly twelve hours a day?—That is so.

26259. How many days a week?—When working ordinary time it is five days a week. Now and then they get six. When times are bad it sinks down to two and three.

26260. When they work six days a week do they work those long hours every day?—No. Generally on Saturday they go down at half past four or a quarter past, and they are coming up again at a quarter past one on that particular day.

26261. On that day only?—That is so. That is what they call their short day. Other tradesmen participate in that.

26262. What engineman puts these down in the morning, the one who has been there from five o'clock?—From five o'clock overnight: that is the custom.

26263. He will have been there, before he finishes, thirteen hours?—That is so.

26264. The other engineman commences with the winding of coal?—That is so. As a rule they generally get there about five or ten to six, and commence with the coal winding.

26265. Do they bring the day men up?—They bring the day men up at night. If they came in sooner the day man would have both lots of men to deal with, and the night man would have none.

26266. How is that?—Supposing the day man comes in at five instead of six in the morning to deal with the men in a fresh state, instead of leaving it to the night man he would have the men to let down that were going down, and if the men were coming back by three o'clock he would have to pull them up at the other end of his long turn.

26267. The remedy would be worse?—One would be as bad as the other. The only sure remedy is a general eight hours' day. That is my opinion.

26268. Have you any other object whatever in securing competent men to be engine-winders than the safety of the men that you put down and take up again?—There is no other object, to my knowledge, and I have had to do with the leading part amongst our men in Lancashire. I have been amongst them in an official capacity since about 1894. I have been the President of the National Federation of Great Britain about four years, and I have been on the Executive, apart from being President, for two years, and in all my experience I have never heard it hinted that it would give us a monopoly. It has been done with a view to being assured that there was a state of efficiency, and where that state of efficiency is we know that lives are more secure, and the men's reputations are better.

26269. In order to make that more secure you think it is essentially necessary that each engineman should be examined and pass an examination, and have a certificate of competency before he is allowed to become a winding man?—I think it would have a tendency to put it on different lines and provide that reasonable efficiency which we find increased power in engines is demanding, as pits are going deeper and tonnage is getting greater, and working is at higher pressure, and the machinery a man has charge of now to look after and attend to is almost three times as much as it was in the olden times. My idea is to keep with the times, that it is necessary that there should, for the future generation, be some examination; otherwise, I am afraid, they will not have the same excellent result shown by the present generation.

26270. Even with the assistance of improved mechanical appliances the strain on the engineer in the work he has to do is as great?—Because he has additional mechanical power to see to, and that gives additional responsibility, and he has to exercise additional care. His attention is required as if those mechanical appliances did not exist, because they have to be watched to keep them in working order, although the results are beautiful; but when you see where there has been a serious calamity and these things have come to the rescue and prevented it, that is the beauty of the business; but so far as relieving enginemen of responsibility and care, I say, it will measure up to a very small quantity in a week's time.

26271. With all the assistance of improved mechanical appliances it has not reduced the necessity of a man being a thoroughly competent man as an engineer and as regards his physical abilities?—That is so.

26272. (*Mr. F. L. Davis.*) Do you know any case or cases where the enginemen have threatened to strike because the management wanted to appoint a certain man to be a winding engineman?—I knew a case where the enginemen struck, but it was in consequence of the management irritating them to that extent by sending a man to every one on their jobs, which made them believe that they wanted to make men for their jobs and turn them away. That was in 1889, and a lot of men were put on when the men struck, but it was under very trying conditions. There had been a difficulty; all the enginemen in the county had notices to insist upon a eight hours' day, but they withdrew, and everything was peaceably settled by every firm except this one. This firm, I do not know whether they wanted to play at Napoleon or not, were not satisfied with the victory over the men and they put a man at every man's engine, to let them see how they behaved, and they took it in that spirit and struck. That is the only time in my whole existence that they have tried to prevent men learning, but it was when they were trying to learn them in a wholesale fashion, which was against them, and human nature rebelled against it.

26273. That was where men were put on with other men to learn?—Yes.

26274. Do you know any case in which there has been a vacancy where a winding engineman has died, or had to leave, and somebody else was wanted for the post? Do you know any case where the other winding engineman already there struck because the management wanted to put a certain man to that vacancy?—I do not know any, but I do not want to assume that it is impossible under the circumstances. Wherever it has occurred it has put the colliery management under very little difficulty in a general sense. It may have been done in an odd place, but I believe that they are bogies we need not fear as causing interference with the coal trade.

26275. Taking it generally there has been very little trouble between the management and the engine men?—I think on the whole, with the exception of this dispute, to the best of my recollection all over the kingdom there has not been a class of men who have had less disputes with their colliery owners, nor about the mills.

26276. I think we are all agreed there?—I think we can say that for the enginemen. They have not shown that fighting disposition, and we do not want them to.

26277. Do all the enginemen in Lancashire belong to that association?—I think we have 90 per cent. just now, and the others are coming in. The Trade Union wave is bringing in these men just as the miners.

26278. When you have these long hours in Lancashire, when do you clean your engines?—In some places they have very large engines for winding from these deep seams,

Digitized by Google

and there is a tremendous amount of polished work about them, and the owners like to have a nice class of engine with bright work about it. As a rule that finds the enginemen plenty of work to do, and they are not so idle as Mr. Ellis suggested. They have to keep these things to perfection. In some places they have a boy to help them, but very rarely in Lancashire, as it is chiefly done by the men themselves.

26279. You would work for a fortnight on day turn ?—No, a week.

26280. Is it every week or fortnight that you have 24 hours ?—Every fortnight. You get an 18-hours' system the other week end. You go on on Monday morning at six o'clock, work till five Monday night, and then go on at six o'clock in the morning till five o'clock on Tuesday, and every day right on till Saturday, and on Saturday you come on at six and knock off at one. You have to do what your mate has been doing the week following, to make up the difference in the round of the clock. You come on every night and stop until six right down to Saturday, and come on at one o'clock on Saturday and stay on till six o'clock on Sunday morning. You have 168 hours to work between you, and that time is divided in this shape. They have one half of the time the clock is going, to be on duty.

26281. You thoroughly overhaul your engine once a week, or your mate does it once a fortnight, and you do it once a fortnight: that is once a week the engine is overhauled ?—In these days we have coupled engines, and a man says, "You have this, and I will have that." They take the responsibility of keeping them up to the mark, and there is a competition to try to get them one as good as another. It cannot be neglected for a week. There is something to be done every day on those engines. They have to be wiped down, and the glands touched up. There is something about an engine to be done if there is no coal winding in the 24 hours.

26282. Do you stop in the middle of the day during the shift ?—In some collieries. At R. Evans and Co.'s colliery in my district they have two half hours for meals. It runs in ten and a half with the meals. In some collieries they wind from six to three, and they have a clear half hour for meals. At some collieries they wind from six till three and never stop. In the case of our Lancashire collieries, where our men are situated like that we have a system that they send a relief man to wind for half an hour, and in some places they give two hours relief for meals out of the twelve each day. We have not much to grumble about on that score. The great bone of contention is the length of the shift itself.

26283. (*Mr. Enoch Edwards.*) Will you explain what paragraph 13 in your statement means, that employers make tempting offers when men attempt by combination to obtain 8 hours ?—That is in reference to the question I have just mentioned, when the men take it into their heads if the employers cannot see their way to get eight hours voluntarily they would force it out of them, and they gave notice in 1899.

26284. What do you mean by employers making offers ?—The employers on that particular occasion, when the notice was almost up, made offers to the men which were equivalent to a very good increase in wages, and other concessions.

26285. It was not a question of wages that you struck about ?—No, but they made this offer, and made it tempting to the men.

26286. They made an offer of an increase in wages, and you accepted it ?—Some of the men accepted it.

26287. You were satisfied with your hours ?—Not generally. We did not accept it; the men accepted it in this manner. You know how the army is when the general is routed; when one large firm gave way it was circulated that they had collapsed, and they all gave way, and everybody went for making the best bargain.

26288. They employed other men and gave them more wages ?—No, employed the same men.

26289. I was right before. You struck for yourselves, but you accepted more wages and went on with the others ?—I would not put it "accepted." The men were compelled to accept more wages.

26290. You struck for shorter hours, they gave you more money instead of shorter hours, and you went on ?—That is so.

26291. Can you tell the Commission in brief why the Lancashire men work such long hours—enginemen and everybody ?—It seems to me to be custom.

26292. You could not tell us why ?—I could not tell you why Lancashire miners work exceptionally long hours. There is every encouragement given to do it, and there are places where they work long hours, and it is in consequence of not being able to get their work out. I have been a checkweighman for seven years.

26293. In answer to Mr. Abraham you said that the men begin to go down at 4.50. Is that correct ?—Yes, that is taking place at the colliery in the village where I am living to-day.

26294. They continue going down until 6 o'clock ?—They continue going down until 6 o'clock as a rule. There are men living not five minutes' walk off the pit going in at 4.30 in the morning.

26295. That is not through any pressure of the colliery owners ?—No, they are not altogether to blame for this; the miners are to blame in some respects.

26296. In those pits could they let the men down in one hour ?—For 14 years this used to be the custom, prior to the 1893 strike, a soul never went down before 5.15, and they finished at 3.40 p.m. We blew a whistle, and there was not another box of coal wound and all the men there came out at four o'clock in the afternoon. But they have extended the time at both ends until it has become almost 12 hours a day.

26297. What time do you get them all out ?—We used to have them out at four o'clock.

26298. What time is it now ?—Sometimes five, even after that, when the men are out.

26299. How do they regulate the boys under 16 ?—They have to come under the 54 hours' Rule, and they do not let them work on Saturdays. They make them play on Saturdays.

26300. Six to six is more than 10 hours ?—They are not the first down and they are the first up at night. It is human nature at that age to always go in last and come out first. The fathers are more to blame than the sons in that respect. I always find a lot of lads to let down at the last and a lot to pull up at the first.

26301. I understood you to say as an estimate that there were about 5,000 engine-winders ?—That is a rough estimate as to the number.

26302. There are twice that number of engine-winders capable of winding ?—Quite that. There is a tremendous number of engine-winders doing other classes of work—men who have gradually drifted into it.

26303. There is no scarcity of winding enginemen ?—No, there is no fear of that. If this lot were pensioned off to-morrow with a full income, and they chucked up the colliery, another staff could be sent in at once.

26304. Are the other men fully competent to wind ?—Which men do you mean ?

26305. You say there are twice the number ?—I should think twice the number in existence that have been winders and drifted to other work, such as locomotive driving or enginemen, or gone down as colliers when times are good, and other men who have been hanging about engines who have been capable for years and years gradually getting proficient; and my contention is that they could restart the whole of the collieries in a very short time with a complete set of men, if it was required.

26306. (*Mr. Ratcliffe Ellis.*) Are all these men to have certificates ?—If a man shows his qualification and he has had the necessary experience.

26307. (*Mr. Enoch Edwards.*) I was coming to that, whether in your judgment these men should all have certificates. You admit they are competent men now. By that rule of competency you would give them certificates of service to start with ?—That is so.

26308. When they gave certificates for coal mines all the first managers got certificates for service and not by examination. You would do the same thing, I suppose ?—Exactly so.

26309. After that a man should have a certificate by examination ?—That is so.

26310. Have you formed any idea why the Government Inspectors are opposed to enginemen having certificates ? That they are not colliery owners or managers ?—The only idea I can form is this: they seem to look upon the matter in the same spirit that it has been put this afternoon, that it would create a scarcity of men or a monopoly, and I believe the Government Inspectors have slightly overlooked the appearance of the thing in the

Digitized by Google

Mr. T. Watson.

9 July, 1907.

manner we see it. They do not see it out of the same eyes. I do not think there is anything to be apprehensive about.

26311. I do not remember a single inspector assenting to the proposition that it would be a good thing to have certificates. You do not know any real reason except that they may have that in their mind?—That is so.

26312. (*Mr. Smillie.*) Do you agree that the present engine-winders generally in this country are a very capable and competent class of men, with very good characters?—Yes, that is so. I think Mr. Ellis, before the Select Committee in 1901, proved by the number of accidents reported and dealt with that they must be a most exceedingly capable class of men, and we admit that to-day.

26313. Might that not be the reason why the Inspectors of Mines express the opinion generally that there is no occasion for any further restriction with regard to certificates?—I could not say what is the opinion of the Inspectors of Mines, but we know that it is natural that the more safeguards you can put round a man to be assured that he has the ability, the more chance you have of being sure of having a man that is capable, and this is only an additional safeguard.

26314. Will you agree that the nature of the employment will naturally draw to it, or should draw to it, the most intelligent and steady class of workmen?—That is so. It has done so far. Young men as a rule, with an ambition for something above ordinary labour, have an inclination to get at the engines.

26315. There is a serious responsibility at all times on the shoulders of the winding engineman?—That is so; there is an extreme responsibility, and more than words can describe. No one understands it better than those who have to work at the engines themselves.

26316. The nature of the machinery in winding engines has changed very much during the past 25 years?—Very much, and the depth of the shaft is very different.

26317. We have come from what is known as the single link engine to the couple engine now?—That is so, and there is a much higher speed.

26318. The depths of the shafts have increased very much lately?—That is so.

26319. The amount of material wound has increased very largely?—Yes, the tonnage has increased.

26320. The size of the drums and the speed of the engines has increased?—Yes.

26321. I think we may take it that an engine-winder who 25 years ago might be winding seven hours out of 10 employed on the day shift will be winding the whole time now?—That is so, with the exception of meal times. There is another feature about the increased size of the engines. Where they used to wind three or four men up, or six, they are winding 30 or 40 men, and if there is ever a calamity through men being fatigued it will be more serious than it would have been in olden times.

26322. You are favourable to making compulsory by law any precaution which could be proved to be a preventive of overwinding in the event of anything going wrong suddenly with the engine-winders?—Everything would be a safeguard, but there is nothing absolutely complete. It would have a tendency in that direction. Anything that has a tendency to prevent sacrifice of life in consequence of people in charge falling sick or dying, is a move in the right direction, and should be appreciated.

26323. What do you mean by 5,000 engine-winders. Is that 5,000 members of existing engine-winders' associations?—We have different classes of men in our Association, which consists of winders and other classes, and we have not them scheduled according to the nature of the work they follow.

26324. Do you suggest that there are 5,000 competent engine-winders?—In our Association, the Federation of Great Britain, which I represent, it will be getting on for 14,000 or 15,000 men, but there are 5,000 engine-winders out of the total.

26325. Do you suggest that Mr. Ellis admits in a general way that those 5,000 men are particularly intelligent and steady men?—Yes, I think Mr. Ellis is prepared to recognise that they are a good class of men, and men of great responsibility, and who have exercised great caution in carrying out their duties.

(*Mr. Ratcliffe Ellis.*) I quite agree with that.

26326. (*Mr. Smillie.*) You suggest that the mines inspectors have also the same opinion?—Yes.

26327. And the mine-owners of this country?—We are prepared to give them credit for their appreciation in admitting that these are a good and cautious class of men.

26328. You would further suggest that those 5,000 engine-winders, from their experience in engine-winding and safety of the men, are in the best position to-day in this country for giving an opinion as to the conditions under which they should work?—Yes, that is so.

26329. Are they unanimous, or practically unanimous, in expressing the opinion that there should be a limitation of the hours of labour to eight hours for engine-winders?—That is the unanimous opinion, and it has been passed by our local branches, our Annual Conference of the districts, and brought before our National Federation and re-affirmed and brought on to the Trades Union Congress, and from there included in the Mines Act Amendment Bill for the last 20 years, to my knowledge, saying that it ought to be done by law.

26330. Further, they are unanimously of opinion that there should be a certificate of competency after an examination?—That is so.

26331. On those two points those men who have had the most experience of the thing, and who are admitted to be intelligent, steady, capable workmen, are unanimous?—Yes, that is so; there is a unanimity of opinion on these particular points.

26332. You are of opinion that these men are in the best position to judge?—They are.

26333. The opinion of 5,000 intelligent men should have great weight in the country and with Parliament?—Yes. Then we have the opinion of our miners' agents. I know both in Lancashire and other places that they have always felt that eight hours was quite sufficient for that particular class of men.

26334. This opinion has been come to by the engine-winders, not so much from any risk of danger which they as workmen themselves undergo, but the risk of danger to the men whose lives are in their hands?—That is so.

26335. They are particularly anxious that they should be in the best position to look after the safety of these men at all times?—Yes.

26336. Is there any real desire on the part of the engine-winders' organisation, so far as you know, in proposing certificates, to limit the number of people, or do they want to make sure that the people who are appointed are really competent?—The desire is to be sure that they are really competent, but there has never been one expression of opinion in the direction of trying to make a corner of the business and bring about a scarcity.

26337. An engine-winder for the time being at the handle of an engine is held absolutely responsible for the lowering and raising of men, and the refusal to lower and raise people under certain conditions?—That is so.

26338. It has been suggested by Mr. Ellis if you had your own way, the way the Association provides for, that there might come a time when, during a dispute, you might refuse to allow the mineowner to descend his pit?—Yes.

26339. And if you had a certificate of competency, that that might limit the number capable of taking that work. May I put it to you at the present time the managers in this country must hold a certificate of competency?—That is so.

26340. Has the mine manager at each colliery absolute power as to who shall ride up and down the shaft?—He has the control as to who shall ride up and down the shaft.

26341. He has full control, and can refuse to allow the mine owner the right to go up and down?—That is so.

26342. Supposing the mine managers of this country some fine morning made up their minds that they would go on strike generally all over the country, have they not the power of preventing the miners going, or even the mine-owner, getting up and down his own pit?—Just the same.

26343. You do not think that such a thing is likely?—No. May I say this with regard to that: it is within the province of the mine managers to combine and agree not to manage the pits until they get certain concessions, which you might consider exaggerated, and they might make it that the pits could not be worked in consequence of having no certificated managers. That is just as probable as the enginemen combining under certain conditions and bringing the pits to a standstill.

26344. There is a limited number of mine managers?—Yes.

Digitized by Google

26345. Probably not anything like 5,000, or half that number ?—There are a good few now ; I think they are increasing. I think there are many mine managers, enough to start the mines over again now.

26346. I suppose no owner would be entitled to tell the manager that he must take some young man and learn him the duties of mine manager ?—Their practice is to claim some voice as to who they learn, and some go so far as to want a premium from the people they are instructing. It is common for a man to pay a premium on entering an engineer's office, even in surveying or mining engineering.

26347. Supposing it were ultimately considered a wise course for the Government to pass an eight-hours' day for engine-winders, it would not seriously interfere with the coal industry in this country ?—I do not think it would. So far as we are looking forward to it, that is a kind of a bogey. It would be a step in the direction of giving us assurance that there was one independent authority to say in addition to the management that this individual is capable of doing this work.

26348. I am dealing with the shortening of the hours of labour now. Eighty-five per cent. of the engine-winders in this country to-day are working what is called the 12-hour shift, the 10 hours and the 14 hours ?—I do not think that there is quite 85 per cent. ; put it at 70 per cent. *Mr. T. Watson.* 9 July, 1907.

26349. Supposing the Government passed a measure making an eight-hours' day the maximum for engine-winders, it would not seriously interfere with the coal trade of the country—I mean by the shortening of the hours ?—It could not, because at the most, assuming that the whole country was working twelve hours at this minute, and they converted all into eight, it would only want a third more enginemen to fill the vacancies, and we know that we have double the enginemen.

26350. The cost on the output would be infinitesimal ?—You have two enginemen at collieries each giving 1,200 or 1,400 tons a day, and the extra cost spread over that 1,200 or 1,400 tons would mean a day's wage for another engineman.

26351. You and the organised engine-winders are of opinion that it would or might limit the risk to the workmen working underground ?—That is so ; it would limit the risk, and everyone would feel in a better and more reliable condition, and I believe that the miners would feel more confident than they do now when they know that a man has been on duty for 14 hours.

THIRTY-EIGHTH DAY.

Wednesday, 10th July, 1907.

PRESENT :

Lord MONKSWELL (*Chairman*).

Sir LINDSAY WOOD, Bart.
WM. ABRAHAM, Esq., M.P. (Rhondda).
F. L. DAVIS, Esq.
ENOCH EDWARDS, Esq., M.P.
THOMAS RATCLIFFE ELLIS, Esq.
JOHN SCOTT HALDANE, Esq., F.R.S.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. DANIEL ALEXANDER WILBERFORCE ROBERTSON, called and examined.

STATEMENT OF WITNESS.

26352. (1) *Examination System.*—I have been appointed by the New South Wales Government to give evidence before the Commission on their behalf on the disparity of conditions which exists between Great Britain and that State in respect to the granting and recognition of certificates of competency as colliery managers. Some correspondence passed between the Governments of the two countries in 1903, and a copy of this was handed in by Mr. Delevingne (see Question 244).

(2) I am also prepared, if the Commission wish, to answer any questions on the following notes which I have made on other matters within the Commission's terms of reference :—

Dust Question.—Explosibility of coal dust either by shot-firing or local gas explosion is proved beyond doubt. Danger area may, therefore, be indefinitely extended beyond the vicinity of initiation by the presence of coal dust.

I approve of watering in the vicinity of a shot, but having regard to the disastrous effect on roof, sides and floor of many mines and the doubtful efficiency of the most practical method, *compulsory* watering is not recommended.

It is useless to water on a main road while other communications are dusty.

In deep, dry mines the temperature is so high that it is not feasible to lay dust effectively. There is always sufficient dust on timber and crevices of coal which on concussion would carry forward an explosion. Often sufficient from face, tubs, and from screens to carry on explosion. Dust taking part in explosion is only the finest and impalpable.

Analyses of dust at the Kembla explosion thought to be fine ; on analysis found to be identical with coal *in situ*. Therefore, dust actually a factor must have been finer, such as carried in the air of best-watered mines. Explosion at Kembla jumped long distances of wet and damp roads and died out in the dustiest parts. Same at Fernie, Canada. Zones of watering, therefore, must be much longer than generally supposed to be effective. *Mr. D. A. W. Robertson.* 10 July, 1907.

Accidents on Haulage Roads.—Better provision should be made in the way of travelling roads to obviate the necessity for workmen walking on steep inclines or haulage roads, particularly where main and tail system in use and in proximity to dangerous machinery.

Standard Method of Testing for Firedamp.—All ordinary inspections by officials should be made by lamps burning mineral oil, which will readily indicate 1 per cent., while colza oil alone will not show clearly less than 3 per cent. Unless where mineral oil should be inadmissible on account of dust, the miner's lamp also should consume mineral oil. It would then be possible to establish a standard height of cap or percentage of gas permissible in the working face, travelling roads and other parts of the mine, the importance of which cannot be over-estimated.

Safety Lamps.—Should be made compulsory wherever explosive gas is known to be given off. Accidents involving loss of life are frequently occurring in mines giving off a little gas and thought to be safe mines, where the contingent dangers are either ignored or not sufficiently appreciated. Neither owners, managers or workmen should be permitted to perpetuate a system fraught with danger to life and property and a reflection upon mining men of the present day.

Digitized by Google

Mr. D. A. W. Robertson.

10 July, 1907

Safety lamps should also, in view of disastrous fires, involving loss of life, be made compulsory in mines (coal mines, at all events), not naturally wet or damp.

26353. (*Chairman.*) I understand that you are Chairman of the Board for Appointing Examiners in New South Wales. How long have you held that position ?—About one year.

26354. What has been your previous experience or your previous occupation ?—I have had 36 years' experience of mining and the management of mines.

26355. Thirty-six years ?—About 30 in the management of mines.

26356. How long have you held a first-class manager's certificate ?—About 30 years.

26357. You are a member of the Metropolitan Coal Company, Limited, of Sydney ?—I am general manager.

26358. You have been appointed by the New South Wales Government to give evidence before the Commission on their behalf on the disparity of conditions which exists between Great Britain and that State in respect to the granting and recognition of certificates of competency as colliery managers ?—Yes.

26359. You state here in your *précis* what the kind of examination is and what the subjects are for which people examine for first-class certificates in Sydney. We should like to know how you consider your examinations compare with ours ?—I consider that our examinations are very much on a par with the examinations in the British mining districts.

26360. In the various districts in England there is a very considerable disparity in the examinations. Some districts are said to give first-class certificates on much less knowledge than others ?—I have heard it said so.

26361. Do you consider, taking them all round, that your examinations are more satisfactory than ours for first-class certificates ?—I should not be inclined to say that they are more satisfactory. I say that they are at least as satisfactory and as severe.

26362. What are the particular points to which you desire to call attention with regard to these examinations ? —Our case is very concisely put in the papers before you, and, really, I have very little to add to that.

26363-4. To the papers that are now before us ?—Yes, but I am here to answer any questions you may ask me.

26365. This letter of the 10th December, 1903, signed by E. F. Pittman, Under-Secretary of the Chief Secretary's Department, Sydney, states that their Coal Mines Regulation Act of 1902 is almost a copy of the Imperial Act, 1887, and that the qualifications required to enable mining men to obtain certificates of competency or of service are in effect practically the same as those demanded in Great Britain ?—Quite so. I do not know whether you have any of our Blue-books before you I have the last one here in which the questions put to the candidates are given, and that will give you a fair idea of the nature of the examination.

26366. Is it your point that these Colonial examinations may be taken in England as being equivalent to our examinations ?—Yes.

26367. That is what you would like to suggest to us ?—Yes.

26368. That anybody who had a first-class certificate in Sydney ought to be treated as if he had a first-class certificate here ?—Quite so ; we maintain that the opportunities for gaining experience are as varied as you will find in the British coalfields, and the examinations are quite as stiff.

26369. I understood you to suggest to us, supposing a man begins his mining experience either in England or Sydney and goes from England to Sydney or Sydney to England, that the experience in England should be taken into account or is taken into account in Sydney, and that similarly the experience he has had in Sydney should be taken into account when he comes to England ?—Yes.

26370. What happens now supposing a man goes to you from England with a certificate that he has worked underground for two years and had practical experience in underground mining for two years ; would you take those two years towards the five years' experience you require for a certificate ?—Yes.

26371. You do that now ; that is your practice ?—Yes, we simply desire to know whether the man has had the necessary experience gained anywhere. In fact we look upon a candidate who has gained his experience in various countries as probably rather a better man.

26372. You say it is not only with an English certificate but also with a Belgian certificate or a German certificate ? —That would be at the discretion entirely of the examiners.

26373. There is no rule laid down by Act of Parliament in Sydney as to what experience a man must have for his five years' experience except that he must have five years' experience in mining ?—Yes.

26374. Supposing he has not had it all in Sydney. If he says, "I have had two years' experience in England, Belgium, or Germany," he must produce evidence to show that he has had that experience ?—Yes.

26375. What evidence do you require ?—He must have documentary evidence from his employers to show that he has had experience, and then it is left entirely to the discretion of the examiners whether they will accept that, because it necessarily follows that experience in one of our States might not be of the same value as experience in another. It depends altogether on the extent to which coal mining is carried on.

26376. Your Act in Sydney has the same words, but you interpret them differently ?—I have reason to think that you interpret your Act in the same way if I am not mistaken ; some of our young men have gone over with the greater part of their experience in New South Wales and it has been accepted here.

26377. (*Mr. Ratcliffe Ellis.*) I think that is not general at all ?—But still it has been done.

26378. (*Chairman.*) Then with regard to the experience in mines it must be for at least five years. That would leave the examiners no option at all if the experience has to be in New South Wales. If the whole experience was in New South Wales, and a man produced evidence that he had had practical experience for five years in New South Wales, then the examiners would be bound to say, "You are qualified to sit for this examination on the ground of experience." They could not refuse him, but supposing he produces a certificate of experience from elsewhere and asks the examiners to accept that experience instead of the experience in Sydney, the examiners have a right to say, "We will do nothing of the kind ; we have an option " ?—Experience gained in your coalfields would be accepted without question, but you must bear in mind that we have some candidates occasionally from other States of the Commonwealth, where coal mining is only carried on to a very limited extent, and it is necessary that they should have that discretionary power to refuse.

26379. Does each Board of Examiners have that discretionary power ?—There is only one Board.

26380. They have absolute discretionary power to say whether a man must produce what they consider sufficient evidence of practical experience for five years ?—Quite so.

26381. (*Mr. Ratcliffe Ellis.*) Supposing a man has had five years' experience in a mine in New South Wales, there is no discretion in the Board of Examiners as to qualification. That qualifies him to sit for the examination ?—Yes.

26382. If he has had five years' practical experience elsewhere than New South Wales, the examiners may please themselves whether they allow him to sit or not ?—Yes.

26383. (*Chairman.*) The Board of Examiners of which you are Chairman would always accept evidence of practical experience gained in an English mine ?—There are two questions involved in that. We do not only ask that the experience gained in New South Wales should be accepted here, but we ask that the certificates granted by the New South Wales Board of Examiners——.

26384. I was not on the point of certificates ; I was on the point of practical experience enabling a man to sit for examinations ; I want to deal with that question first before I go on to the other. Dealing with the question of the amount of mining experience that will entitle a man in New South Wales to sit for the first-class certificate, you say in practice that you would always recognise experience in an English coal mine ?—That is so.

26385. You have never refused a man who has produced evidence that he has had practical experience for so many years in an English coal mine. There are parts of the Commonwealth which you feel it necessary to exclude ? —Yes, because coal mining is carried on to a very limited extent ; in fact in some not at all.

26386. And foreign countries ?—Yes.

26387. Experience of underground work in some foreign countries you would take, and in others you would not take ?—As a matter of fact I do not know that we have had any from foreign countries.

Digitized by Google

26388. You suggest that it should be reciprocal and in England—I am only now dealing with the experience that would enable a man to sit for examinations—we ought to accept practical experience in New South Wales as being equal to that gained in the United Kingdom ?—Yes.

26389. If the Board of Sydney is willing to vouch that a man has had practical experience for so many years in New South Wales you think that it should be accepted in England ?—Yes.

26390. The ground for saying that is because you think a man may gain as varied a practical experience in New South Wales as anywhere else ?—Yes.

26391. That is as regards experience. Then you go further and say that the New South Wales certificate should be recognised in England just as our first-class certificate is accepted in that State ?—Yes.

26392. If a man comes from Sydney with a first-class certificate he ought to be able to take a manager's place in England ?—Yes.

26393. Your ground for saying that is you consider your examinations are quite as stiff as the average examinations in England ?—Yes, and the experience to be gained is quite as varied. Let there be no misapprehension; this is only asked on behalf of the State of New South Wales. There must not be any misapprehension in the matter that it is on behalf of the Commonwealth. It is only New South Wales where coal mining is carried on to any great extent. I am not here on behalf of Victoria or Queensland.

26394. You have not had sufficient experience in other mines in Australia to make a suggestion as to whether a certificate from Victoria ought or ought not to be accepted? —There are very few coal mines in the other States, and I should say it was impossible that a candidate could possibly have the necessary experience if he had worked entirely in Victoria or Queensland.

26395. You are prepared to put in some examination papers to show the nature of the examinations in Sydney ? —I put in the Annual Report of the Department of Mines for New South Wales for 1906.

26396. Do you wish to make any further observations other than those which are contained in these official documents with regard to experience and examination for first and second-class certificates ?—No, I do not know that I can. I only wish to say that our coal mines there on the whole, I think, compare favourably with the British coal mines. They are very well equipped; some of them are very deep, and there are a great variety of conditions. Some of them are very gassy, and I consider that the management of our mines, to say the least, will compare favourably with British coal mines.

26397. You propose to give us your views with regard to the dust question and watering and so on. There is one statement you make which I should like to hear your explanation of. You say the explosion at Kembla jumped long distances of wet and damp roads and died out in the dustiest parts, and that the same thing happened at Fernie in Canada. That is contrary to the opinions of witnesses who have appeared before us. What do you mean by "long distances of wet and damp roads" ? —The explosion at Kembla started in a dusty portion of the mine and it travelled out towards the tunnel mouth, and the last part of it—that is at the tunnel mouth there were at least 200 or 300 yards of road damp, one might say almost wet.

26398. It went right through at least 200 yards of damp road ?—Yes, it went right through and ignited. Besides destroying the engine-house it ignited some woodwork outside. It also died out in the dustiest portion.

26399. Perhaps it had expended nearly all its energy before it got to the very dusty portion, and consequently there was not sufficient wind to raise the dust?—It died out in the dustiest portion within about perhaps 300 yards of the point of origin, and it went out in the wettest portion against pretty nearly a mile of roadway.

26400. I do not quite follow what you mean.—It died out in the dustiest portion within about 300 yards or so of the point of origin of explosion, and it travelled out against a road wet and dusty in patches and finally 200 or 300 yards of wet road, probably three quarters of a mile from where it originated.

26401. You mean that it went in two directions ?—It went in several directions.

26402. In one direction it died out after 300 yards in a dusty part after having traversed 200 yards of wet road ? —No, I am afraid I have not made myself clear; the explosion in one direction died out in dust within, say, 300 yards of the point where it originated.

26403. What did it pass through ?—Dust.

26404. Passed through dust for 300 yards and died out in the dusty part ?—In the dusty part.

26405. It went the whole way through a dusty part of the mine and died out of itself within 300 yards, although the whole of the road it went through was dusty ?—The 300 yards. Then in the other direction it went out towards the tunnel mouth for a distance of probably three quarters of a mile, and that road in parts was wet, with patches of dust on the tunnel mouth end; that is, the furthest point from the point where the explosion started, and was quite three-quarters of a mile, so that the explosion actually died out in dust within quite close proximity of where it originated.

26406. Was the explosion a very strong explosion in that direction ?—It was violent in the wettest direction.

26407. In the direction in which it died out in 300 yards did it begin by being violent ?—Yes.

26408. It died out very suddenly ?—I daresay within 300 yards; I speak approximately, but it was something like that.

26409. (*Sir Lindsay Wood.*) Where it died out in 300 yards was the current going in the same direction as the explosion or against it ?—It was going with the explosion.

26410. In the three quarters of a mile was it going against the current ?—Yes.

26411. (*Mr. Ratcliffe Ellis.*) What sort of a road was it—a haulage road ?—A haulage road.

26412. Horses ?—Endless rope.

26413. What sort of dust was it ?—The mine in the ordinary sense would not be considered very dusty.

26414. Shale dust or coal dust ?—Coal dust. It was rather coarse dust.

26415. (*Chairman.*) Was it finer in the direction it went further ?—No, I should say not.

26416. What about this Canadian explosion ?—That I only know of by reading the various accounts of the explosion.

26417. As regards the Kembla explosion, that was a colliery you went down yourself ?—I was down there within one hour after the explosion, and I subsequently spent some time as a Royal Commissioner investigating the cause of the explosion.

26418. You can put in a Report you made on that explosion ?—Yes.

26419. You want to say something to the Commission about accidents on haulage roads. You think that better provision should be made in the way of travelling roads to obviate the necessity for workmen walking on steep inclines or haulage roads, particularly where the main and tail system is in use and in proximity of dangerous machinery. What is your suggestion with regard to the prevention of accidents ? What do you do in Sydney ?—My remarks apply everywhere I think. There is not sufficient provision made in many cases for the safety of workmen. I think travelling roads should be provided in dangerous positions and steep inclines where the main and tail rope system is in operation.

26420. What is the main and tail system ?—The essential difference between the main and tail and the endless rope is that the speed is very high in the main and tail, anything from 10 to 15 miles an hour, but with endless rope it is not very often more than 2 miles an hour.

26421. What do you do in Sydney with regard to making haulage roads safe ?—Generally speaking separate travelling roads are provided. In my own colliery we have many miles, in some cases we have duplicate travelling roads so that horses might go on one and men on the other.

26422. Where the men are obliged to go alone on the haulage roads, do you consider it necessary to have a gangway on one side sufficient for a man to walk on to get out of the way of the trucks ?—It is not in all cases so. In certain dangerous positions for instance apparently walking along a haulage road you come to a place where there is machinery overhead and you have to step down to 4 ft. 6 or 5 ft. 6, and with the racket of the machinery you cannot hear the trucks coming forward, and accidents undoubtedly may and do occur in that way.

26423. If you had a gangway you could always walk on the gangway at the side ?—That would not be in all cases

Digitized by Google

Mr. D. A. W. Robertson.

10 July, 1907

practicable. The roof might be so bad that it would be practically impossible to maintain a road wide enough to permit that. You might have a separate travelling road a few yards off.

26424. Have you anything further to say about accidents on haulage roads?—No, only my general opinion that greater provision should be made for the protection of workmen travelling in dangerous conditions. There are some haulage roads where the endless rope is in operation moving at a very slow pace, 2 miles an hour, which is under the rate a man can walk himself. There is not much need for it there.

26425. Your experience of mines I understand has been got not only in New South Wales, but you have been over a large number of mines in the United Kingdom?—I have been 20 years in New South Wales, and for nearly 20 years before then I had experience in the British coal mines.

26426. (*Mr. Ratcliffe Ellis.*) I see you say that it would be possible to establish a standard height of cap or percentage of gas permissible in the working face, travelling roads, and other parts of the mine.

(*Chairman.*) What is your explanation of that paragraph? Mr. Ellis wants to know what you propose to do under that suggestion of yours?

(*Witness.*) The examinations for firedamp are made at the face by lamps burning different oils. You cannot, as you have heard before in this Commission, detect less than 3 per cent. if you burn Colza oil. I maintain the examination should be made by lamps burning an oil which will show percentages at least down to 1 per cent., and then you will have a uniformity in the results, but the reports at present are very confusing, because it is quite clear that one man is examining for gas with an oil that will show 1 per cent., and another man is examining with an oil that will only show 3 per cent. Of course, you will have very different results.

26427. (*Mr. Ratcliffe Ellis.*) You say in your second paragraph with reference to the standard that it would then be possible to establish a standard height of cap or percentage of gas permissible in the working face, travelling roads, and other parts of the mine. Do you consider that there should be some percentage of gas that might be permissible?—You must, you cannot avoid it. You cannot have mines absolutely free from gas. At present there is such a diversity of opinion upon that point that it is very desirable that some standard definition of dangerous percentages of gas should be arrived at.

26428. When you have got your standard, what then?—If you exceed the standard the men are not to be permitted to work.

26429. Is it up to a certain standard that they should be permitted to work?—Yes; it is obvious no matter how perfect the ventilation may be, if a mine gives off gas freely you must have some percentage of gas in the air.

26430. (*Sir Lindsay Wood.*) I think the point is this, that the percentage of gas now permissible is that when it shows a cap?—Yes.

26431. If it shows a cap it is not permissible to work, but the showing of a cap is a debateable point. Then you say some oils show 1 per cent. and some show 3 per cent., and you want to have some standard system introduced?—I do not mean where a lamp shows the presence of 1 per cent. of gas that working should not be permitted. It is the only means of indicating what percentage is in the gas. Then comes another question: what percentage would you allow? You would have to allow more than 1 per cent. That is obvious.

26432. The crucial point is the showing of a cap?—Yes.

26433. That, you say, is an uncertain quantity?—That is so. We know Colza oil will not show less than 3 per cent; therefore if a lamp burning Colza oil shows a cap it must be more than 3 per cent., and more than 3 per cent. would not be permissible.

26434. (*Chairman.*) I do not understand how you gauge the difference between 1 per cent. and 3 per cent. The mineral oil lamp will show a cap of 1 per cent. Do you go by the height of the cap?—Yes.

26435. At 2 per cent. the cap would be so much higher? Yes.

26436. You measure the cap?—Yes.

26437. The fireman, or whoever's business it was, would measure the cap on the lamp and say, "This is a safe cap: it only shows 1½ per cent."?—Yes.

26438. (*Sir Lindsay Wood.*) On the question of the explosion dying out within 300 yards, do you attribute that to the fact that the explosion was going in the same direction as the air?—That may have been a factor, but I have not come to any conclusion on the subject. I merely record it as a fact.

26439. The effect would be that the explosion itself was depriving the current of the air necessary to feed the explosion?—No doubt.

26440. It was burning the air, and preventing the oxygen getting to feed it?—I might explain that the mine was ventilated by more than one inlet, and in the one direction in which the explosion died out through a pair of doors it met a fresh current of air; that is to say, it followed the air current from where it originated for so many hundred yards, and then blew through two doors and met a fresh air current. It would be an intake in that case really against the explosion.

26441. It is very difficult to judge?—Yes.

26442. Are the mines in New South Wales very similar in extent to the English mines, so that the experience of a man would be somewhat similar to what it is in England?—Yes. We have some very extensive mines, and I think there is at least one, the colliery with which I am connected, where, in so far as the gas is concerned, I have not met anything so dangerous in any British coalfield. We have very large ventilation, 400,000 cubic feet a minute, and a good deal of gas in that.

26443. Does it extend over a large area?—The workings cover an area probably of 2,000 acres, and that is in the course of about 18 years' work, and there are other mines even more extensive.

26444. A large proportion of the mines are worked by drifts?—They are mostly worked by drifts. The last few years there have been a number of shafts sunk. The Sydney Harbour Colliery is the deepest, nearly 3,000 ft. That is exceptional. The next is the colliery with which I am connected, working at a depth of about 1,500 ft., but then again the shaft is only 1,100 ft. It is sunk in a deep gorge.

26445. What would be something like an average depth? Does it run about 300 ft.?—More than that. The average depth would be considerably over that. A large number of mines are 500 odd ft., 600 ft., and 700 ft., and from that on to 3,000 ft. For the most part they are now worked by safety lamps.

26446. (*Mr. Enoch Edwards.*) This explosion to which you referred, I understood you to say, was along a dusty road. The explosion spent itself and was exhausted in 300 yards?—About 300 yards.

26447. It was over a wet roadway. How wet was it? Was it naturally damp or was it by being watered?—The roadway was damp, but dusty in parts.

26448. There must be some material to feed the explosion?—No doubt that accounted for it up to a certain point, but it ended at 300 yards or so in a road that was distinctly damp, and fired the engine houses outside.

26449. What do you think is the explanation that the dusty road did not feed the explosion and carry it on?—I cannot say. I merely state the fact. I believe that the experience at Fernie, in Canada, was similar; but I do not know about that from personal observation.

26450. This mine you refer to you know all about?—Yes.

26451. Was it a gas explosion?—We think it was a gas explosion originally, but what ignited the gas is a mystery, because there was no light.

26452. No blasting?—No question of a shot involved. There was no light within 200 or 300 yards.

26453. (*Chairman.*) And no man?—Nobody.

26454. (*Mr. Enoch Edwards.*) Do you use electricity underground?—At that time?

26455. Yes?—Yes, they had electricity.

26456. Electric coal cutters?—Not at that time.

26457. You have no doubt that it did not arise from that?—There is absolutely no question. It was not an explosion from shot-firing, and it must have been ignited, but how it was ignited is a mystery. It was a naked light mine, I may say.

26458. Is not the other portion rather a mystery, that it would travel so far along the damp road and does not travel or feed on a dusty road?—It is a curious thing, but that is supported, I say, by the experience at Fernie.

Digitized by Google

26459. You have not been able to solve that riddle ?—No, it is a mystery to this day.

26460. Was the dust of such a nature that it would feed an explosion ?—I may say it was not, in the ordinary acceptation of the term, a dusty mine, but apparently, of course, it did.

26461. (*Dr. Haldane.*) What made the road wet ?—It was naturally wet. They had watered, but I am afraid they did not water very systematically.

26462. Was the dampness of the road due to watering ?—Artificial watering ?

26463. Yes ?—No, not in my opinion.

26464. It was natural damp ?—The Company claimed that they watered the roads, but I do not know that we were very well satisfied on that point. It was watered naturally, in the mines, from the surface.

26465. (*Mr. Enoch Edwards.*) Some portion of the road is naturally damp, I understood you to say ?—Yes.

26466. The roadway of 300 yards which the explosion travelled was dusty. It ceased to travel beyond that point. You have no explanation of why it did ?—No.

26467. You make a suggestion here about the percentage of gas in a place. You suggest with a certain kind of oil that is used you will be able to ascertain a fixed standard of gas ?—We cannot at present, because you burn different oils.

26468. Do you mean that if you could get a lamp that will fix you a standard of 3 per cent., that 3 per cent. prevents you working in it ?—I do not mean to say that at all. They do at present, no doubt, because there are a lot of miners working using colza oil, and they are permitted to work although there may be gas almost sufficient to show 3 per cent. It must be quite clear if the cap is distinct on a colza lamp that it is 3 per cent.

26469. Is not the fireman capable of detecting this gas when going his rounds ?—If the oil will not detect under 3 per cent., he cannot. That is the limit of his powers.

26470. Do you suggest in all fiery mines in this country that the fireman going round with a lamp when there is gas cannot detect it ?—He cannot if he burns colza oil. That is obvious.

26471. It is suggested that 3 per cent. of gas in a dusty mine is sufficient to cause an explosion ?—Certainly.

26472. So that do you seriously suggest that in all the pits in this country, when the fireman is going round and there is a condition of things of that sort, with men working, that he cannot detect it ?—Very possibly. I think it is very likely.

26473. You think so ?—I am sure of it. If they burn colza oil they cannot possibly detect under 3 per cent.

26474. (*Dr. Haldane.*) Have you made any analysis of the air to show that fact, because it is a most disturbing statement. Do you know any analysis of the air to support that statement ?—I make tests along with the Government inspectors with lamps burning colza oil, and also mineral oil, and undoubtedly, comparing with the test made by the hydrogen lamp, the colza oil will not show under 3 per cent.

26475. Are there reliable analyses to show that ? It is a statement that is most extraordinary ?—Is it ? I am not aware that it is extraordinary. I have often heard it before.

26476. (*Mr. Enoch Edwards.*) It is the first time it has been suggested here to us ?—That colza oil will not show less than 3 per cent. ?

26477. It is the first time it has been suggested in the way you put it, that a fireman may go round with his lamp examining a pit which is in a highly dangerous condition, there being 3 per cent. of gas in the place, and would not be able to detect it.

26478. (*Dr. Haldane.*) How is such a test made ? I have done tests with far less than that, and the cap was as distinct as possible ?—Burning colza oil ?

26479. Yes ?—I do not know.

26480. Did they pull down the flame when testing ?—Certainly. If you burn pure colza oil you cannot see under 3 per cent.

26481. I should say you could easily see a good deal under 2 per cent. ?—That is a matter of opinion, I do not think so. I am sure I have often heard the statement made before.

26482. These statements are made very loosely. There is no analysis of the samples ?—I can only say I have made the experiments with the Government inspectors, and that is the opinion we have formed.

26483. You have only checked the percentage with a hydrogen lamp ?—Yes.

26484. You might over-estimate the percentage with a hydrogen lamp ?—Not very much.

(*Dr. Haldane.*) I think it is very difficult to determine.

26485. (*Mr. Enoch Edwards.*) When you say it has been suggested, do you mean you have heard it suggested in England ?—Certainly. I have often heard it. I believe you will find it in the text-books, too.

26486. I am right in stating that it is suggested if there is 3 per cent. of gas in a dusty mine you have all the elements of an explosion ?—Certainly.

26487. So that you may have firemen passing places as safe every morning ?—Quite so.

26488. We have been living in rather a fool's paradise here ?—I daresay you have.

26489. Of all the inspectors and experts who have been here, none have told the Commission that we have such a condition of things which we approve as safe. The present law is very clear that we require ventilation to dilute this gas and render it harmless ?—What is "harmless" ; I want to have the standard established.

26490. It is less than 3 per cent., because 3 per cent. could not be said to be harmless ?—Why do they establish 3 per cent. ? Is it not because that is the lowest percentage that can be detected by the lamp that was in use for a number of years ?

26491. That is how you put it, I understand ?—Yes.

26492. With regard to your reference to travelling roads, do I understand in New South Wales that you have separate travelling roads in your mines ?—Very often. I do not say that we are perfect in that respect, but I say that there are conditions in many mines dangerous, in my opinion, and I do think that better provision ought to be made under those circumstances.

26493. You have, perhaps, heard that several witnesses here have suggested making a by-road alongside the tramway, keeping a sufficient width always for men to travel to and fro ?—That might not be always possible with a bad roof.

26494. I understood you to suggest as an alternative that you thought the safer way was to drive a separate road ?—Yes, and I think it can be done in most cases. I do not see why in longwall working a separate travelling road could not be generally adopted. I see no reason why it should not.

26495. In all cases where you have main haulage roads there should be a separate travelling road ?—Yes. I do not say in all. There may be some of an exceptional character, where the expense would be too great, and, perhaps, which would warrant exemption.

26496. Have you had much experience of watering roads in mines ?—Yes—well, I cannot say that I have had much experience, as, probably, the management in this country, but it has been done very extensively. I have seen a very well-watered mine.

26497. Have you seen any in this country watered ?—Yes.

26498. Recently ?—Yes.

26499. (*Mr. Ratcliffe Ellis.*) With reference to your examinations, you have an alternative to the five years' practical experience in a mine, and it is that a period of three years' apprenticeship to a mining engineer may be substituted by a candidate for a first-class certificate as an alternative for an equivalent period of regular employment in a mine under the Act, if the apprentice has, in the discharge of his duties, to go down mines and obtain practical experience therein ?—Yes.

26500. Would you take surveying as sufficient practical experience ? You do not say the practical experience in the management, but you say an apprentice to a mining engineer, if he has to go down mines and obtain practical experience therein. Would you consider surveying sufficient ?—Not surveying alone. That would be a matter for the examiners to determine, whether the nature of his duties while in the mine afforded an opportunity for him to gain experience. A man confined entirely to surveying I do not consider would be sufficiently qualified.

26501. Is it looked into closely to see what duties he has to perform in one of those alternative qualifications ?—

Digitized by Google

Mr. D. A. W. Robertson.

10 July, 1907

The examiners satisfy themselves. The surveyor's duties very often are more than surveying: they are general; probably an assistant to the manager, and so forth.

26502. That is enquired into ?—Yes.

26503. Not merely that he has to go down mines to obtain practical experience, but the nature of the experience he gains is enquired into ?—Yes.

26504. Can you obtain a diploma from any certified mining college in your country ?—Yes, we have technical colleges. There is the university mining class and technical colleges in three main centres, also local technical classes.

26505. You do not accept as a substitute for part of the experience in a mine a diploma from one of these colleges ?—No, but I think they should. I think so myself, but the Board, so far, have not come to my way of thinking.

26506. That has been adopted in England ?—Yes.

26507. You think that would be desirable ?—I think it is highly desirable, considering that a scientific education is required now from employers. I think it is ridiculous to think that the time a man spends in acquiring that scientific education should not count.

26508. When you get a certificate from England as to a man's experience who is going to submit himself for examination in New South Wales, what is the form of the certificate ?—A certificate from his employers as to his duties, and so forth ; nothing else.

26509. Does it say what duties he has performed ?—Yes. The examiners would satisfy themselves that the candidate has had the necessary practical experience.

26510. They can only satisfy themselves upon the certificate. They do not send to this country for evidence ?—No.

26511. Have you a form of the certificate sent ?—No, they are the usual documents.

26512. Could you say what is put upon the certificate ? You have seen many of them, no doubt ?—They do not come before me, although I am Chairman ; they come before the examiners.

26513. You do not know what is said on it ?—What is usually said on testimonials as to character and experience.

26514. The examiners do not take any trouble to ascertain what is the character and the experience a candidate would have in the mines. It is in the letter that comes to them ?—They satisfy themselves also by oral examination of the candidate.

26515. I am talking about the qualification to sit; as to his ability to pass, that is another matter ?—I mean before they allow him to sit they will take these written testimonials from the employers and ask the candidate questions.

26516. It is upon what he says as well as the written letters that they accept his experience ?—Yes.

26517. You have an ambulance examination for the second-class candidates ?—Yes.

26518. But not for the first ?—I think so.

26519. It does not seem to be here ?—If you look at the rules for the conduct of examinations I think you will find it there.

26520. I beg your pardon. I see these remarks apply to both classes of candidates ?—Yes.

26521. In your oral examination the candidate must satisfy the examiner that he has a thorough practical knowledge of mining ?—Yes.

26522. Electricity does not seem to be put in here ?—Yes, this last year or two, but I do not know whether I can find it. That has been brought up before the Board, and I think notice was given that it should be a subject for examination. I see from the Blue Book that it is one of the subjects—machinery, boilers, pumps, electrical appliances, etc.

26523. You may have added it since this was put in. With reference to machinery, does that include coal cutting ? Yes, we have a lot of coal cutting in Australia.

26524. That is as to the qualification to sit. With reference to the examination, have you one Board ?—Yes.

26525. One examination only ?—No, there are two examinations—one generally held at Newcastle and the other at Sydney.

26526. Different examiners ?—No, the same examiners.

26527. How frequently are these held ?—Twice a year.

26528. The same examiners ?—Yes.

26529. At each place ?—No, only one in Newcastle and one in Sydney.

26530. So that there are two in the year, but by the same examiners ?—Yes.

26531. (*Dr. Haldane.*) The whole of the coal production is in New South Wales ?—Yes. There is some in New Zealand.

26532. There is some in New Zealand ?—Yes, but it is practically all in New South Wales.

26533. (*Mr. Ratcliffe Ellis.*) Have you candidates from any other places except New South Wales ?—We have had one from Queensland, who was rejected.

26534. You allow them to come and sit ?—Provided they satisfy the examiners.

26535. You do not exclude them from any other place ?—No.

26536. When a man comes with an English certificate is that re-certified in any way by your mining authorities ?—It has to be produced and registered.

26537. Produced to the mining authorities in New South Wales, and it is registered ?—Yes.

26538. Is there any communication with the Home Government as to whether this is a valid certificate or not ?—The production of the certificate is sufficient.

26539. It might have been cancelled here ?—It may be. It is a very unlikely contingency.

26540. You have no communcation with the Home Government ?—No.

26541. Is not that desirable ?—I daresay it is, but I should call it an extreme precautionary measure.

26542. If your certificates were recognised in England you think they should also be registered here by the Home Office ?—Yes ; I should think it very improbable that any candidate would produce a cancelled certificate.

26543. It might perhaps be safer if a certificated manager, who has a certificate in New South Wales, is going to use it in England, or one who has it in England is going to use it in New South Wales should have it visaed in some way before he takes it away from here or there ?—I quite concur.

26544. (*Mr. Haldane.*) Would it not do to notify the Government there of any cancellation ?—That would be better.

26545. That would save a lot of trouble ?—Yes.

26546. (*Mr. Ratcliffe Ellis.*) With reference to gas in New South Wales, is it your experience that men are working in gas to the extent that you have mentioned —3 per cent. ?—I do not think so, except in one colliery. There is not sufficient gas given off to bring about a percentage of 3 per cent. There is only one, and in that one they are examined with mineral oil.

26547. Have you the same regulation in New South Wales as we have in No. 1 General Rule ?—Yes, only there is an additional proviso that the adequate ventilation is defined as so many cubic feet per minute, and a very dangerous thing, in my opinion.

26548. In your view as a manager, is that a safe state of things ? You say in New South Wales you know men are working in gas to the extent of 3 per cent. ?—I did not say so. I said the contrary. I said only in one mine was gas given off in sufficient quantities to give 3 per cent. in the air.

26549. What is the condition of that mine ?—In that case the examinations are made with mineral oil lamps, and the men would not be permitted to work in 3 per cent., or anything like it. If the examinations were made by lamps burning colza oil the chances are they might be working in 3 per cent. and be quite unaware of it.

26550. (*Dr. Haldane.*) Is it pure colza oil that is commonly burnt in miners' lamps in New South Wales, or a mixture of colza and paraffin ?—Generally a little kerosene mixed with it.

26551. Just as there is in England ?—That is not pure colza. Some do mix a little kerosene, and that makes a material difference, but others are using pure colza, and if you use pure colza you cannot detect it. You asked me about colza oils. If you say a mixture of colza with something else it is a very different matter.

26552. (*Mr. F. L. Davis.*) What is the output of the colliery that you are connected with ?—330,000 tons per annum.

26553. Is that one of the largest, or the largest ?—No, there are some with larger outputs than that.

Digitized by Google

26554. What would be the biggest output ?—I do not know whether I can give it to you.

26555. Roughly ?—I think there is one that has had about 400,000 tons.

26556. In these mines you have stated, I think, that there is a great amount of working open ?—Some of them are very extensive.

26557. Have you had any watering ? Is it done in New South Wales ?—The main roads are watered where safety lamps are in use to a considerable extent.

26558. How is it done ?—By tanks.

26559. Is anything done in the way of spraying the roofs or sides ?—Only locally. There is no general system. I may say in my own colliery we water with a hose, but only in the vicinity of shots, and we have no shot-firing in coal. It is only in stone. Very elaborate precautions are taken. We have a pump and a hose.

26560. For shot-firing ?—Yes.

26561. To what distance ?—30 or 40 yards from a shot, and we usually remove all the dust first. We take very elaborate precautions.

26562. Would systematic watering affect the strata ? —Yes, undoubtedly.

26563. In your opinion, could you water thoroughly the whole of a mine ?—In my opinion it is absolutely impossible. You could not even if it was not injurious. In many mines it would be impossible. Take my own case. The temperature is 83 degrees; it is very dusty, and there are many miles of travelling ways and return airways, large roads heavily timbered. Even if we had the water to spare it would be nearly impossible to keep it watered, the evaporation is so great. As a matter of fact, we have not got the water.

26564. What sort of roofs have you generally ?—Shale roofs. There are a few cases of sandstone.

26565. Those roofs would be affected by watering ?— No doubt they would.

26566. Going back to the explosion, how much of that three quarters of a mile would have been damp or wet, and how much of it dusty ? You have told us that parts of it were wet and parts of it were dry ?—I daresay probably three-fourths of it would be dusty.

26567. And one quarter of it would have been wet ?— Yes, but the outer end of it was damp.

26568. For how far ?—About 300 yards.

26569. For the last 300 yards ?—About that.

26570. (*Mr. Smillie.*) Have you many prosecutions of either officials or workmen for breaches of the Coal Mines Act ?—Yes.

26571. A considerable number ?—You will find them all in this book.

26572. Roughly, have you had many ?—I daresay in my own place I may have 10—10 to 14.

26573. I suppose the proportion of prosecutions to the number of men employed will be as large as it is here ?— I think more.

26574. Are all offences by workmen against the Mines Act prosecuted for if they are found out ?—Not necessarily, because I would have to have a court every day. Many are minor breaches which of course we cannot possibly prosecute for in every instance. They are let off with an admonition, or something of that sort.

26575. It depends upon the offence ?—It depends altogether on the character. There are some offences it is policy not to prosecute for. A man will take more notice of a lecture than a prosecution.

26576. Have you any system of management fining the workman guilty of a breach of the Coal Mines Act, or a breach of any Rule ?—We never fine for breaches of the Rules.

26577. There would be a prosecution for any serious breach of the Act likely to lead to loss of life ?—That is certain. There would be a prosecution in any case except of a very minor character. I do not say that it would apply to every mine, but there are a number of the best regulated mines where they are very strict.

26578. (*Mr. Ratcliffe Ellis.*) Do you fine for offences that are not provided for by the Mines Act ?—Only for the filling of debris. That is a matter of agreement.

26579. (*Mr. Smillie.*) There is no fining for breaches of the Special Rules or the Mines Act ?—No. I think that would be very improper.

26580. As a colliery manager you have had long experience; do you think it would be a mistake to have fines ?—Yes.

26581. Have there been many prosecutions of colliery managers or other officials ?—Yes, I prosecuted some of my own officials where they had neglected their duty. I would not hesitate to prosecute.

26582. Is the Inspector of Mines supposed to send on a list of all convictions against managers or officials to the Minister of Mines ?—Yes; they are all recorded in the Blue Book.

26583. If there is a serious breach of the Act or a report of incompetency made by the Mines Inspector, has the Minister of Mines power to appoint a court to hold an enquiry, and has that court power to cancel a certificate ?— Yes, it has been done. There have been several enquiries that have lasted only too long, I am sorry to say.

26584. You accept first or second-class certificates granted in Great Britain to colliery managers in New South Wales ?—Yes, without question.

26585. You do not allow any person to be in charge of either winding engines or haulage engines or electrical engines unless they hold a certificate of competency ?— No, it is scarcely that. That is restricted to winding engines only. A Bill was brought in requiring all men in charge of machinery of every class to hold certificates, but after representations were made to the Minister he altered it confining the certificates to winding engine-drivers only.

26586. Was that since 1901 ?—That is only quite lately.

26587. The Act of 1901 provided for certificates of three classes ?—I do not think so, you have got it wrong. Was that metalliferous mines ?

26588. The Mines Inspection Act of 1901 published in 1906 ?—That applies to metalliferous mines.

26589. Only ?—Yes, I am referring to coal mines.

26590. This only applies to metalliferous mines ?—Yes, there is a reason for that. In metalliferous mines nearly everybody in charge of machinery has occasion to wind men up little staple shafts and so on, but in coal mines it is only the winding-engine drivers who have to wind the men.

26591. In coal mines winding-engine drivers require a certificate of competency ?—Yes, but I think it is a great mistake.

26592. That at least is the law ?—That is the law, and I think it is a great mistake.

26593. (*Mr. Ratcliffe Ellis.*) Is there any objection to saying why you think so ?—I maintain that a winding-engine driver's duties are such that you cannot find out his qualifications for the position by examination. It is a matter of his moral character, his judgment, his nerve, and no examination in the world will ever find out whether the man possesses the necessary qualifications for that position. We do not need a man, nowadays, having a knowledge of mechanics, at least a very intimate knowledge of mechanics, for the position of a winding-engine driver. He is sitting there all day long and has not to go near the boilers, in fact he does not need to supervise them at all. In all collieries nowadays there is a mechanical staff looking after the condition of the machinery.

26594. (*Chairman.*) What about the examination for physical fitness ? It has been stated that on more than one occasion in England a man has died suddenly from heart disease, which might have been found out if he had been examined periodically. Do you examine periodically? —Not periodically. Under the Act there are some certificates of service granted, and the candidates for certificates at examinations have to produce medical evidences of their fitness.

26595. Where it may involve a serious accident if a man had a sudden attack of any sort, would you have any precaution to find out periodically whether a man's health was such that he could be fairly well trusted ?— No, there is no periodical examination. I think there is a good deal more reason for that than the examinations for competency in other respects because it is a man's moral and physical qualities more than anything else.

26596. You do not have anything in the nature of a medical examination. A man may go on 30 years and have developed some disease which may kill him suddenly, and you know nothing about it. You do not, as a matter of fact, try to detect anything of that kind ?—No, I agree. I think it is a proper position that they should be periodically examined, at the same time we have never had any accidents. That is one of the reasons I advanced to the

Digitized by Google

Mr. D. A. W. Robertson.

10 July, 1907

Minister for restricting the issue of those certificates to winding-engine drivers, that we have never had any accident.

26597. (*Mr. Smillie.*) We may take it that you disagree with the Government, and you say that the Government were wrong in passing that law?—That is hardly a fair way to put it. I would much sooner take a certificate of character or fitness from another manager than I would take the certificate of the Government. The examiners sit a few minutes, or it may be half a day, and how can they know of a candidate's fitness for the position of an engine-driver?

26598. Do you apply the same opinion to colliery managers' certificates?—No, that is a different thing. Colliery managers' qualifications, to a great extent, can be discovered by examination, but you can see that a winding engine driver's fitness is a matter of moral and physical qualities.

26599. Have you any ideas of the views of engine drivers and miners in New South Wales?—Of course there is a craze for certificates everywhere; it tends to create an exclusive caste, and there is no doubt as to what their opinion would be.

26600. You consider it a craze only?—Yes, I think it is a craze. I have two winding-engine drivers who have been performing their duties for about 18 years and under very difficult conditions. The winding is very quick, and they have never made one mistake, and I am absolutely certain that if they were put through the examination most assuredly they would be plucked. I have another young fellow, only about 21, who is absolutely incapable of handling these winding engines and still he has a certificate, and he has the higher status of the lot, and I would not give him their duties to-morrow.

26601. Have you ever known colliery managers who were good colliery managers, and who would have been plucked if they had sat for a certificate?—Yes, I daresay.

26602. I suppose you are aware that some excellent men when the Act came out got a service certificate who would have been plucked at an examination?—There would be no necessity to be plucked if they got a service certificate.

26603. Who would have been, that is what you said about your two engine-winders?—I think that is very likely.

26604. That did not prevent the passing of the Act that made it compulsory for colliery managers to pass an examination?—The cases are hardly parallel. In the one case it is mental ability and in the other case it is physical ability.

26605. An engine-winder requires, under this Act, to have a considerable knowledge of machinery?—There is a distinction as to the requirements of engine drivers in the Metalliferous Act.

26606. I am dealing with the winding engineman?—There is a difference between the two. There is the metalliferous mine and the coal mine. In the metalliferous mines the men's lives are more or less dependent on other men. Nearly every man is in charge of machinery because there are little winches underground winding up staple shafts.

26607. It is more necessary that there should be some care taken in the appointment of the men?—Yes. I agree that we did not raise any objection to it being confined to engine-winding men.

26608. Has it limited your choice in any way to the number of men?—The Act has not been long enough in operation to express any great opinion about it. Experience in the Transvaal from all accounts is rather unfortunate. They have all certificates there and in no part of the world are there more accidents in winding shafts.

26609. (*Dr. Haldane.*) Are the engine drivers certificated in the Transvaal?—Yes, they are all, and it is a very unfortunate state of affairs the number of accidents in winding shafts.

26610. (*Mr. Smillie.*) I suppose a man, who is otherwise qualified, who has a good moral character and who is a good engine-winder would be no worse supposing he had a certificate?—No.

26611. Provided he had the other qualifications. Nerve is one of the chief qualifications necessary?—Yes.

26612. Did I understand you to correctly state to Mr. Ellis that the persons going from Great Britain to New South Wales and wishing to sit for a certificate do not have to satisfy the Board but the examiners. I understand you are chairman of the Board?—Yes.

26613. Do you say they do not satisfy the Board as to their qualifications for sitting, but that they satisfy the examiners?—In the same way as the other candidates. We lay down rules for the examination, and the Board formulate these rules and the examiners satisfy themselves as to the testimonials of the different candidates.

26614. The system is here before they are allowed to present themselves to the examiners they must satisfy the Board through the secretary that they have had the qualifications. A person presenting himself from New South Wales for examination here would, in the first place, require to satisfy the Board, not the examiners?—Of course the testimonials are sent in to the secretary of the Board, but these are dealt with by examiners, and the examiners report to the Board.

26615. It is possible that candidates outside of New South Wales might get the length of the examiners, and might be objected to there. That is not possible in this country?—After all, the Board is not any more fit to investigate the qualifications of candidates than the examiners.

26616. I wanted to make sure whether that was your method?—Yes.

(*Mr. Ratcliffe Ellis.*) The question as to whether a man is qualified to sit does not depend upon his ability to pass an examination: it depends upon having complied with certain regulations made by the Board. Therefore I think it is rather for the Board to say whether a man is qualified to sit or not: whether he is qualified to pass the examination is for the examiners.

(*Mr. Smillie.*) He may be qualified to pass, but the examiners might prevent him sitting?

(*Witness.*) Yes.

26617. In our case the Board does that?—Yes.

26618. There is five years practical experience required before a candidate can sit in this country?—Yes.

26619. As Mr. Ellis pointed out in your rules a three years' apprenticeship to a mining engineer may be substituted?—That is the same in some of your districts.

26620. This is how it was at one time.

26621. (*Mr. Ratcliffe Ellis.*) In the northern counties they have something of the sort?—I think in more than one. When we formulated these rules we had nearly all the rules for examination before us. I am positive that is so.

26622. (*Mr. Smillie.*) Is there any serious grievance on the part of colliery managers in New South Wales that they are not permitted to come to this country: that the certificates are not accepted here?—Yes, there is, and there is a great deal of feeling: it is a question of status. We accept the Imperial certificates without question, and if we have men as capable as they are here, and the experience to be gained is as varied, why should our certificates not be accepted? They are gained at an examination which, we submit, is in all respects similar to the examinations in the British coalfields.

26623. Is the coal trade of New South Wales developing rapidly?—Yes.

26624. Is the supply of colliery managers passed by your own examiners sufficient to meet the demand?—I should say that it is more than sufficient to meet the demand. It does not at all follow as in British coalfields that every candidate who passes will obtain positions.

26625. (*Mr. Enoch Edwards.*) Or that he will get a position when he has passed?—Yes, that is so.

26626. (*Mr. Ratcliffe Ellis.*) Are the Special Rules similar?—In some cases a great deal more elaborate: in my own colliery we have about 260 of them.

26627. (*Dr. Haldane.*) Can you tell me whether there is a separate examination in New Zealand for colliery managers' certificates?—I think so.

26628. It will be well to settle this question in all parts of the Empire while we are at it, if it can be done?—Every application would have to be taken on its own merits, because it is obvious that except New South Wales and probably New Zealand there is no other State in the Commonwealth that is entitled to ask for it on its merits. We could not, for instance, ask that applications from the whole of Australia should be granted.

26629. I do not know anything about Canada; it is an important part of the Empire?—I do not know sufficient of Canada to say.

26630. Supposing the manager of an English metalliferous mine goes to Australia, he must pass an examination

Digitized by Google

before he is allowed to manage an Australian mine: is that not so ?—I cannot speak with any confidence about metalliferous mines, because I confine myself to coal mining.

26631. There is no official English certificate, and that is one of the questions referred to the Commission ?—It would have to be reciprocal, of course, I should say. The conditions are reversed in metalliferous mines, because metalliferous mining is a much more important industry there than here, but of course in regard to coal mining it is out of all proportion greater here.

26632. They do insist upon an official certificate for the manager of a metalliferous mine in Australia ?—Yes.

26633. There is no certificate in England ?—It is a very small industry here.

26634. It is very unfortunate for people who go out there from here ?—Yes.

26635. Are there any arrangements in your collieries for the men washing at the pit-head before they go home ?—None. I do not know whether we could make such arrangement, because water is sometimes a great consideration with us.

26636. Even enough to wash with ?—Yes, we cannot get enough to drink sometimes.

26637. The point you have raised about the difference between colza oil and mineral oil is a very important one. Do you think it is desirable to have experiments to get that matter settled ?—I think so; I attach very great importance to this point; I think we ought to have some reliable standard which you can go upon.

26638. Do you mean also a maximum standard for firedamp permissible in parts of a mine that are in work. I mean where the men are working ?—Yes.

26639. You think that is desirable ?—I think that it is highly desirable, because it is a matter of difference of opinion at present; it ought not to be a difference of opinion at all, there ought to be an official standard.

26640. Are you much troubled with black damp in your collieries ?—Yes, in some of the collieries. With efficient ventilation in some of the mines it is scarcely noticeable. We have a very curious composite gas in my own colliery; it may be the only instance known where carbonic oxide is given off naturally from the coal. There is the curious circumstance of firemen searching on the roof and also on the floor for firedamp; that seems inconsistent, but it is a fact. The gas is a composition in many places of carbonic oxide, carbonic acid gas and firedamp, and you very often find it on the floor, and it shows that characteristic blue cap on the floor just the same as on the top.

26641. You would have it sometimes on the floor and not on the top ?—We have it both.

26642. That might be because the gas was equally mixed. Can you have it on the floor and at the same time the air clear above ?—As a rule where we have it on the floor it is clear on the top, but we certainly have carbonic oxide given off naturally from the coal, and not from any combustion of powder or coal.

Mr. D. A. W. Robertson.

10 July, 1907

26643. Does that carbonic oxide cause much practical inconvenience ?—No, I am inclined to think that scientists are a little out with respect to the percentage that a man may work in.

26644. How do you mean "a little out" ?—I consider in the early days, before we had our second shaft down, that frequently there was in the air a much higher percentage of carbonic oxide than our scientists declare it is possible for a man to work in.

26645. How do you know it was there ?—We know it was there; we had it analysed. I reported it to the Department of Mines and they all laughed me to scorn at the idea of carbonic oxide being given off naturally, but I had it analysed at considerable cost, and by a chemist from the Department of Mines, and the former was confirmed.

26646. I know the circumstances; there is some there. I think to substantiate your statement that it is possible to work in a larger percentage would require very good evidence, and it is very difficult to get exact analyses where carbonic oxide is present. Are you aware that the best re-agent for carbonic oxide is oneself or an animal ?—Yes.

26647. Do you consider that carbonic oxide is given off from the coal without any heating whatsoever in your mine ?—Yes; it is not so general now. It was more in the vicinity of a shaft and near to an enormous sheet of dolorite horizontal, but we do meet with it all over the mine, but not generally.

26648. The men are affected by it ?—The ventilation is usually so vigorous—we have 400,000 cubic feet.

26649. Not generally, but occasionally ?—Of course we can soon demonstrate it by cutting off the air for a little; you will soon realise that you have carbonic oxide to deal with.

26650. Does that air give you a headache ?—Yes, all the characteristics.

26651. Does it make you weak in the legs ?—Yes; it is certainly rather remarkable to see our firemen searching for firedamp on the floor.

26652. You think that they sometimes would get it on the floor when they cannot get it on the roof ?—I do not think it; I am sure of it.

26653. You are sure they would sometimes find it on the floor when it is not to be seen above ?—Quite sure.

26654. Do you know whether that is ordinary firedamp ?—Yes, ordinary firedamp mixed with carbonic oxide and $C.O._2$.

26655. Is there no question of it being a heavier gas like petroleum vapour, or anything of that sort, which is naturally heavier ?—No, it has been analysed.

26656. It is very difficult to make a mixture of firedamp and blackdamp which will be heavier than the air and yet show a cap ?—It is there. I shall be very pleased to demonstrate it to anyone.

26657. It is a very interesting thing ?—Yes.

Mr. HENRY DAVIES, called and examined.

STATEMENT OF WITNESS.

Mr. Henry Davies.

26658. (1) I am the Director of Mining Instruction for the Glamorganshire County Council and Secretary of the South Wales and Monmouthshire Mining Education Board.

I arrange schemes of instruction, deliver lectures, and conduct parties of mining students "touring" various coalfields. I have had 15 years' practical experience of mines at home and abroad, and have inspected mining schools in England, Germany, Belgium and America.

I advocate a system whereby lads in mining districts intended for work in the coal mines should be taught something bearing upon their occupation for the remainder of their lives before they leave school, *e.g.*, lessons on the following subjects are given in the Glamorgan primary schools to lads about leaving for the collieries:—

Coal, and how it is formed.
Coal mines gases, and how they become dangerous.
The safety lamp and how to use it.
How a colliery is ventilated.
How the coal is worked in a mine.
Rules framed for the colliers' safety.

In order to make the instructions real and effective, the school inspectors have been instructed to grant certificates to the lads who attend a full course of lessons and give evidence that they have benefited thereby.

I recommend, too, that every plan practicable should be adopted to continue the education of the lads after they have commenced their work at the mines, so that they may be instructed in rules framed for their safety and that they may be induced to take an intelligent interest in their surroundings and duties. This may best be done by evening continuation schools and technical classes.

Mr. Henry Davies.

10 July, 1907

(2) The system adopted under the Glamorganshire County Council is the following :—

As there are many young miners anxious to continue their education from the point they reached in the primary schools, who are insufficiently prepared in the rudimentary work for admission to the technical classes, a special preparatory class in mining has been arranged for evening continuation schools. The syllabus for this stage includes instruction in the following subjects :—

(*a*) English grammar and composition.

(*b*) Mathematics — arithmetic, mensuration and algebra.

(*c*) Elementary drawing—freehand, model and geometrical.

(*d*) Elementary science of mining.

While, in order to arouse the interest of the student, t may often be necessary to approach a subject from the standpoint of the miner, yet there must not be any slavish narrowness of treatment in this respect ; generally the instruction in the preparatory subjects should be such as would be useful to any industrial student and, in fact, in many cases, the classes will be attended not only by those engaged in mining, but by others also engaged in such occupations as building, engineering, &c.

(3) This is a complete course, specially arranged to meet the requirements of those : (*a*) Who are desirous of securing certificates of competency of the first or second class under the Home Office ; (*b*) who are candidates for the mining or engineering scholarships offered by the Committee ; or (*c*) those who are anxious to become really efficient in the science of mining. The course is divided into four stages as follows :—

First Stage (First Year) :
- (*a*) Practical mathematics.
- (*b*) Mining.
- (*c*) Mechanics and heat.
- (*d*) Geology.

Second Stage (Second Year) :
- (*a*) Practical mathematics.
- (*b*) Mining.
- (*c*) Mechanical drawing.
- (*d*) Mine surveying.

Third Stage (Third Year) :
- (*a*) Practical mathematics.
- (*b*) Mining.
- (*c*) Applied mechanics.
- (*d*) Electricity and magnetism.

Fourth Stage (Fourth Year) :
- (*a*) Mining.
- (*b*) Mine surveying.
- (*c*) Heat and the steam engine.
- (*d*) Electric lighting and the transmission of power.

Efforts are made to establish preparatory, or first-stage classes wherever there is a populous mining village. Second-stage or advanced classes are fewer in number, and opened only at suitably equipped centres. The former classes are generally conducted by local teachers, who may be engaged at the collieries or primary schools during the day, and the latter by members of the Committee's travelling staff of teachers.

(4) A short course of special lectures has been arranged for officials and miners who, for various reasons, are not members of the Committee's evening classes. This course bears directly upon the cause and prevention of colliery accidents. Popular lectures are also delivered under the auspices of the Miners' Federation Lodges.

(5) The tours are at present arranged as follows :—

For students in Stage 2 : The South Wales Coalfield.

For students in Stage 3 : An English or Scotch coalfield.

For students in Stage 4 : A continental coalfield.

Twenty-five scholarships are awarded in each of Stages 2 and 3 and 20 in Stage 4.

The scholarships are awarded on the results of examinations, which are held by the Committee, in three of the subjects forming the mining course. Only students making at least 20 class attendances (or with the manager's certificate proving the student to have been engaged on the night shift, 15 attendances) in classes for the above subjects, and presenting themselves for the Board of Education Examination in Mining (Stages 2, 3 or 4) are eligible to compete.

The quality of the student's homework (as presented on exercise books) is taken into consideration when the scholarships are awarded. Teachers are expected to make two reports during the session, showing the marks possible for, and secured by all students in their classes.

The value of these scholarships is as follows : For continental tour, £8 ; for English or Scotch coalfield, £4 ; for South Wales coalfield, £3.

A limited number of these scholarships are awarded to teachers of evening technical classes, taking at least two of the subjects forming the mining course, and teachers of evening continuation schools who have taught the preparatory course in mining at their schools.

One-half the amount of the scholarship awarded will be paid the student when he enters upon the tour, and the remainder on receipt of a satisfactory report on the collieries, &c., visited, provided that the report be received within one month of the return of the party. If the report be not received within one month, one-half of the scholarship will be forfeited.

The privileges of these scholarships may be enjoyed by students only once in each stage.

The continental tour occupies at least eight days ; English or Scotch tour, about six days ; and South Wales tour, six days ; each commences early in July.

The special summer course of instruction in mining and correlated subjects, arranged for students qualified for instruction in the higher parts of the mining course, is held in August or September.

(6) During the session 1905-6 no less than 28,000 pupils attended the Glamorgan evening classes.

In mining technical classes, of which there were 76, 1,730 students were enrolled ; in the 33 mathematics classes, 800 ; 52 ambulance classes, 1,381, and 25 engineering classes, 527.

(7) During the last few years I have taken considerable interest in the duties and hours of colliery firemen (examiners), and would strongly urge upon the Commissioners the desirability of recommending that arrangements be made whereby these officials should pay greater attention to the actual supervision of the miners when at work. I believe that more thorough and effective supervision would quickly effect a reduction in the number of accidents ; and, further, think that a "shift" of 12 hours and upwards for these men is too long. I beg to hand in copies of some returns I have secured as to the duties and hours of colliery firemen.

I further believe that these officials should pass a Government examination to prove their competency before being appointed to so important an office.

(8) *Ventilation.*—I would recommend that returns be made of the quantity of air passing through a mine once every 14 days, and that a record be kept of the air-current as shown by such measurement ; also of the percentage of gas present in the air-current at the last working place in a "split" when the air measurements are taken ; and that such records be always available for examination by the Government inspectors.

(9) *Traffic on Main Roads.*—It is advisable, too, that haulage should be stopped on main roads and engine planes at the beginning or end of a shift, when workmen are passing to or from their work, unless special provision be made for the safety of the men.

(10) *Colliers as Hauliers.*—I would recommend that special provision be made to prevent accidents to colliers who are called upon to take the places of absent hauliers ; also that some effective steps be adopted to put an end to the system of "tipping" hauliers by colliers, as I think this is a fruitful source indirectly of accidents in some collieries.

(11) *Home Office Examinations.*—The present system of Home Office examinations for certificates of competency of managers or under-managers should be improved. Greater uniformity in the standard of requirements is desirable. The examiners should be changed periodically. Mining engineers who receive premiums from articled pupils should not be members of the Boards of Examiners, examining such pupils for certificates under the Home Office.

(12) *Appointment of Inspectors.*—I would respectfully suggest that some better plan than that in operation at present be adopted for the appointment of inspectors. The present system causes dissatisfaction, and gentlemen holding the position cannot expect that respect from colliery officials that they would receive if their appointments were made under a better system.

Digitized by Google

(13) *A Knowledge of Welsh desirable for South Wales.*—The inspector, too, should have a speaking knowledge of the language generally used by the workmen in the mines, and by their deputations; *e.g.*, no inspector should be appointed to the South Wales district who does not thoroughly understand Welsh.

The number of inspectors, too, should be increased as to make the inspection of the mines "thorough"; but their visits should not be such as to make them jointly responsible with the manager for the working of the mine. At present the inspection is not in all cases effective.

26659. (*Chairman.*) I propose to begin towards the end of your statement and deal with the suggestions you make with regard to safety. You are, I think, the author of a book entitled "Colliery Accidents: Cause and Prevention"?—Yes.

26660. The book consists of various lectures you have delivered?—Yes.

26661. You say with regard to the colliery fireman, that you strongly urge upon the Commissioners the desirability of recommending that arrangements be made whereby these officials should pay greater attention to the actual supervision of the miners when at work, and you believe that more thorough and effective supervision would quickly effect a reduction in the number of accidents, and that a shift of 12 hours and upwards for these men is too long, and then you hand in your returns. We should like to hear your views upon that?—I have the actual returns here, should either of them be questioned.

26662-4. You have the returns in your book?—Yes. I have the names of the people who made the returns in each case, and the names of the collieries.

26665. You say that they should pay greater attention to the supervision of the miners at work. Do you mean that should be their only work, and that they should not be required to do any other work?—I think they can do other work as well as supervise the operations of the men. But what I want them to do is to attend more to ventilation than to rubbish trams, more to firedamp than the time taken by men to fill repair roads. I think if that were done there would be a very considerable reduction in the number of accidents, and that speedily.

26666. You mean that now they do not attend to their chief duties as much as they ought. Although it is well to attend to the general working of the mine and see that the men fill the trams quickly, or that they are moved quickly, which has nothing to do, or little to do, with accidents, their main duty should be to guard the men against accidents, and they should only do these other things when there is plenty of time to spare from their duties?—I believe their time would be so occupied in attending to safety that they would have but little time to spare.

26667. Would it not be better to say at once that the fireman should only attend to duties in connection with safety, and that other people should look after the management of the mine in other respects?—Yes. I believe the overman and under-managers would have enough work in looking after the general traffic and business part, and that the firemen have enough to do in looking after the real safety of the mine.

26668. Although there may be occasions when firemen might have time to attend to the general working of the mine, still it should be understood that his business is to look after safety and do nothing else?—Yes, I would tie the examiner down to that work appertaining to the safeguarding of the workers' lives.

26669. Do you think that as a rule the firemen's districts are too large?—Judging by the reports which I have compiled, they are considerably too large, especially when they have to carry round in the morning two safety lamps, a staff, an electric battery, a cable, and then have to stand and examine for firedamp a hole which may be 10, 12 or 13 feet in height.

26670. The shift of 12 hours is too long?—Yes, because I do not think they can be mentally alert for such a long time in the polluted air of the mine and the numerous occupations in which they are engaged.

26671. Do you suggest an eight hours' shift?—I do not suggest eight hours any more than seven or nine, but I think that the shift should be so reduced as to make the work thoroughly efficient.

26672. You think a seven to nine hours' shift would be about as much as they could do?—On an average I think if they work well and hard, and carry out the duties apportioned to them for eight hours, that they would be mentally and physically exhausted.

26673. You further think that they should pass a Government examination. What examination would you suggest?—I would not make it an examination like the under-managers', but where rules appertaining to ambulance, ventilation, management of air currents, registering of firedamp, and things of that kind, would be the special requirements.

26674. You would have a special examination: you would not think it necessary to pass a second-class manager's examination?—No. I think the second-class has more to do with the business side now than the safety side. I would make this examination to bear more on safety than the general management of the mine.

26675. You think second-class certificate men might pass and not be efficient firemen. They might not know sufficient about various matters that you deal with here to attend properly to the question of safety?—Yes.

26676. The second-class certificate compels you to know something about ventilation?—Yes. A man at present may sit for the second-class and pass with experience only fit for any colliery giving off carbon dioxide gas, and yet be appointed to a colliery giving off firedamp; he might pass an examination dealing with gas which he would never see in the future and had not seen in the past.

26677. Have you come across a considerable number of firemen not competent to perform their duties properly?—I have not come across one, or I would tell the manager immediately. At a colliery near where I live a man was Chairman of the Works Committee on Wednesday; there was a strike on, and on Thursday he was appointed fireman; on the next day the strike ceased. This is an exceptional case. The man was a very good workman, a good miners' agent and would, as a rule, make a good official. There are complaints of cases of that kind. I do not say that this man was inefficient, but I say that he was Chairman of the Works Committee one day, and the next day he was a fireman.

26678. (*Mr. Ratcliffe Ellis.*) What is the Works Committee?—A committee of workmen that has to deal with an arrangement between the owners and the men on matters appertaining to disputes with regard to wages, or other matters of that kind.

26679. (*Chairman.*) Why should he not be a good fireman?—I did not say he would not be: I only say it happened to be a coincidence that a chairman of a Works Committee should be specially selected during strike time to become a fireman.

26680. (*Mr. Ratcliffe Ellis*). As chairman he was telling the colliery owners what to do, and so they appointed him an official to do it?—The next day he would tell the men what to do. I am quoting that as a case in point, because it proves the need of examination.

26681. (*Mr. Enoch Edwards.*) It would be a way of breaking up the strike?—I do not suggest that. I state it as a fact.

26682. (*Chairman.*) You have had no practical experience of any accidents through a fireman not having passed an examination?—I have a considerable number of reports here, and judging by the way some of them are filled up I believe the writers should have passed an examination dealing with the nature of firedamp.

26683. Looking at those reports you say that there are a certain number of firemen employed who are not capable of making a proper report?—No, I will not go so far as that, but I think that their reports would be better if they had been compelled to pass through a training for an examination.

26684. Do you say that the reports are absolutely unintelligible in many cases? What is the objection to them?—They are too indefinite. There is a lack of the trained mind: where a man writes "some" gas or a "little" gas, for instance. In some districts to-day we go to a place and an old workman will say "They complain about the gas now, but there is only a thimbleful. We worked years ago with a wagonful, and there was no complaint then." Men brought up under a system of that sort have to be taught a great deal more as to the value of detail, accuracy and correctness in making reports.

26685-6. With regard to ventilation, the returns should, you think, be made once in every 14 days?—Yes.

26687. Is not a record kept?—A record is kept. There is a record of measurements made once a month, but I

Digitized by Google

want to have them kept when they are made once a fortnight. Whilst they are measuring the air I want them to measure the gas, so that we may know not only the quantity but the quality of the air current. I want them to measure the number of cubic feet passing at the last working place, and I think that the percentage of gas present at that spot should be recorded. Now they examine for gas with a lamp that shows only 2 per cent. whereas 1 per cent. in the presence of fine dry coal dust, forms an explosive mixture.

26688. How do you detect 1 per cent., by having mineral oil?—No, they now use the Davy lamp, which will not show practically less than 2 per cent., whereas it is an acknowledged fact that 1 per cent. with fine dry coal dust forms an explosive mixture.

26689. How do you test that?—With a Clowes' lamp.

26690. How little will that show?—½ per cent., if necessary, or less. The Clowes' lamp is the only one I know as being really useful.

26691. With regard to the traffic you say that haulage should be stopped on main roads and engine planes at the beginning or end of a shift when workmen are passing to or from their work, unless special provision be made for the safety of the men. What special provisions would you suggest if you do not stop the haulage?—A travelling road, or a part reserved for the men to walk, where there would be no danger of being run over.

26692. You would have a gangway?—Yes.

26693. Always kept clear, not only at the man-holes, but so that you could instantly step aside anywhere?—Yes. When I was at one of the collieries there was a wild run, a tremendous noise and a shout; there was not sufficient time to search for a man-hole. We got to the other side of the shaft and the trams ran into the "sump."

26694. With regard to colliers as hauliers, you would recommend that special provision be made to prevent accidents to colliers who are called upon to take the places of absent hauliers, and also that some effective steps should be adopted to put an end to the system of "tipping" hauliers by colliers, as you think that is a fruitful source indirectly of accidents in some places. That is the first time I have heard of this practice. Do you mean they do it in order to get down to the shaft quickly?—No. A collier in Monmouthshire "pays rent" before possibly he will get his tram in time, or a suitable supply of timber, and I hold that that is a source of a number of accidents.

26695. Who does he pay the money to?—To the haulier. The collier pays the haulier.

26696. The haulier being the person who brings the tram?—He takes the tram, and in the tram frequently there is the timber that is going to the collier.

26697. The haulier shoves the tram on to the working face?—He drives it by means of horses.

26698. He is the man who looks after the horses?—Yes, and if he gets a tip he naturally takes to that collier the first tram of a journey.

26699. (*Mr. Ratcliffe Ellis.*) We have an Act of Parliament ready to your hand, the Prevention of Corruption Act?—I hope you will see that it is applied.

26700. (*Chairman.*) That is the first time that I have ever heard of that practice?—We want better supervision. If we get better supervision they may have time to apply that Act.

26701. (*Mr. F. L. Davis.*) Does this apply all through Monmouthshire?—It applies to the colliery where I made the enquiries, and it applies to some parts of Glamorganshire, too, unfortunately.

26702. I do not quite understand what it is. Will you explain it?—I will tell you how it is done. In Glamorganshire we have, unfortunately, in some collieries what are called occasionally a "trump Saturday." There is a man who divides the journey. He is the supervisor amongst the hauliers, and he has six hauliers or less working under him. He divides the journey and may send the first tram to the man who has given the tip on the previous Saturday. This man collects all the tips on the pay Saturday, or half-pay Saturday. There is a main haulage road, and if there is a man in a stall wanting timber who has not paid his "rent" or given "trumps" the previous Saturday, he may not get the timber in time, as it is taken on to the man in the next district. This man may be working in an exceedingly dangerous place requiring timber, but because he didn't pay this "rent" on the previous Saturday he has to wait for the timber.

26703. (*Chairman.*) Do you know that as a fact?—Yes.

26704. You know where a man has complained that he has had to wait for his timber because he has not paid his rent, as he calls it?—Yes, but with better supervision that would be made impossible.

26705. You recommend that special provisions should be made to prevent accidents to colliers who are called upon to take the places of absent hauliers?—Yes. A haulier may be absent and a collier is called upon to take his place, but that collier does not know the horse and the road, and when tram gets off the road the collier tries to push it back. There may be a sound as if everything is right, and the horse starts off and the collier is banged against the side, and gets his back sprained or worse injuries.

26706. How do you suggest to remedy that?—I have not a suggestion. I only want to point out that many accidents arise from that cause.

26707. You think that people are obliged to take duties that they are not competent to perform?—I am not sure if they may be compelled. There is a dispute as to the extent to which a collier may be compelled to take the place of a haulier, but I know that he does occasionally.

26708. Does he get more wages?—As a rule a haulier gets less, but they make him an allowance to make up for the difference.

26709. (*Mr. F. L. Davis.*) May I explain it, or will you explain it? The hauliers are erratic men, and not regular in coming to their work. If a haulier is not there the collier does not get trams or clearance, and cannot make money, and when the hauliers do not turn up the collier takes the haulier's place to help the other men?—The collier has not always been willing to do so, and it is a question of the extent to which he may be compelled. There has been a case fought in South Wales as to whether a collier may be compelled. I know when he does he frequently gets into trouble by having his legs broken, or some other accident.

26710. Then you suggest that some better plan than that in operation at present should be adopted for the appointment of inspectors. Hitherto we have been told that the Government inspectors give every satisfaction?—To whom?

26711. In general?—The workmen in our district do not feel quite satisfied, and they want an increase.

26712. They are not satisfied with the present staff of inspectors?—They are satisfied with the present inspectors, but they are not satisfied with the present system of inspection. I hope you will pardon me for pointing out the difference.

26713. You would not like to say anything against the inspectors, naturally. You would like them to be treated fairly, but you think that the system may be wrong, although the men are very good men?—This is the system as far as it hurts a working collier who is a good man. We had a case where a man was put on the inspectorial staff without any examination. He was on for 12 months, and came up for examination at the same time as a collier who had only a month's warning of the examination. I hold that is not fair.

26714. You think that a man should be given every opportunity, and that he should not be called upon to go in for an examination suddenly which he would not be able to read up for?—I believe that all men should have the same opportunities.

26715-6. How do you mean, every man should have an opportunity?—The matter can be arranged so as to make a repetition of the case to which I have referred impossible.

26717. When a man is considered by the Home Office to be a fit person to sit for this examination he should be given ample warning of it?—In this particular case one man had 12 months' warning, and the other one had only a month.

26718. In those cases where the Home Office has come to the conclusion that an applicant is a proper person to sit for examination, you think that he should have ample notice and should be given at least six months' notice, or some minimum time, to work up for his examination?—They have at the Home Office quite a long list of candidates who have been nominated, and all those candidates who are considered qualified ought to have the same warning as to the date of the examination.

26720-31. It might have happened in this particular case that the Home Office had only just become cognisant that the man was a fit and proper person. It might be said that they had no opportunity of giving further notice than they did.?—It is quite possible. All the candidates who had been nominated and whose names were on the accepted list could have been told at the beginning of the 12 months, like the man who was appointed provisionally.

Digitized by Google

26732. Then you say that a knowledge of Welsh is desirable for South Wales, and you think that no inspector should be appointed to the South Wales district who does not thoroughly understand the Welsh language. You also suggest that the number of inspectors should be increased, so as to make the inspections of the mines thorough, but that their visits should not be such as to make them jointly responsible with the manager for the working of the mine, and that at present the inspection is not in all cases effective. Then you say that a case will be quoted to prove this. What is your case?—A boy within the last few months had to go 148 yards to obtain a post underground in a mine in the borders between Glamorganshire and Monmouthshire. In another case the inspector was at a colliery enquiring into the cause of an accident—an explosion; the cause of that explosion at the time was unknown. Possibly it might have arisen from ignited firedamp meeting a damaged lamp, or oil on the gauze of the lamp, and during the time the inspector was there a number of safety lamps were brought to the pit top on a full tub of coal, placed carelessly on the ground and carried in the hands of boys to the lamp-room. I hold that the inspector should have seen this if the inspection was sufficiently keen. He should have prevented its repetition, because an explosion may arise from a drop of oil on the gauze assisting the passage of the flame through and so igniting firedamp.

26733. Irrespective of this particular instance that might arise from the carelessness of an inspector, you consider that the districts are too big?—Yes.

26734. You think that they ought to be sub-divided. Do you suggest that you should have double the number of inspectors or how many?—I would not like to suggest the exact number. I suggest that they should be so increased as to make inspection thoroughly efficient and make a repetition of what I heard on Saturday last impossible. A case was quoted where a colliery official had not seen the chief mines inspector for five years. That was at a large colliery.

26735. We find from the statistics that the inspectors do go down every mine in their district, or very nearly every mine in their district, once a year.

(*Mr. Ratcliffe Ellis.*) He says the chief inspector.

26736. (*Mr. Enoch Edwards.*) Had he no accidents during the five years?—Yes, there were accidents there, because that was the colliery where I found the boy who carried the post 148 yards. The boy thought that he had walked 200 yards to bring this post, but the distance was measured and found to be 148 yards; but I can easily understand a boy carrying a 6 ft. post thinking it was 200 yards.

26737. (*Mr. Ratcliffe Ellis.*) What has that to do with the inspectors?—If the timber had been placed in a convenient position and easily accessible to the collier, the lad would not have had to walk that distance.

26738. What has the inspector to do with that?—He has to see that the timber is placed in a convenient position, or report the officials who are guilty.

26739. Are you speaking of the Government inspector?—Yes.

26740. (*Mr. F. L. Davis.*) How many inspectors do you propose to have in order to see that the timber in each man's place is in a convenient position?—I simply say if inspection is necessary at all it is advisable that it should be efficient.

26741. (*Chairman.*) Do you suggest that mines ought to be inspected underground by every inspector or assistant inspector more than once a year?—Yes.

26742. How often do you say—twice?—I should say that it is necessary at least twice a year.

26743. (*Mr. Ratcliffe Ellis.*) If the inspector must see that the timber is always sufficient, he must be there every day?—That does not follow. If he succeeds in bringing the officials and men into a good habit once every six months, the results will continue until he comes again. If the timber is not conveniently placed, as an inspector he is partly responsible, surely, for not seeing that the Act is complied with.

26744. (*Mr. Enoch Edwards.*) Do you suggest that the inspector was there when the boy was sent for the timber?—No.

(*Chairman.*) You suggest that the inspector did not go round the working places to see that the timber was where it should be.

26745. (*Mr. Ratcliffe Ellis.*) To see that it was near enough. How is an inspector to do that?—How is he to see that the timber is placed in a convenient position?

26746. Yes?—The Special Rules specify that the timber should be placed in a convenient position.

26747. The General Rule specifies where the timber is to be placed. That is the duty of the manager?—Yes, and who is to see that the manager carries out that part of the Act but the mines inspector?

26748. The inspector can only give a general supervision?—Yes.

26749. He cannot be responsible if the timber is not on a particular day within 100 yards of the place where it ought to be?—The mines inspectors are appointed to see that the Coal Mines Act is efficiently complied with, and if it is not, there is something wrong with the inspection unless the officials or men are prosecuted.

26750. Is your view that because upon some occasion a boy has to fetch timber for 100 yards therefore that is proof that that mine is not sufficiently inspected by the Government inspector?—No, that is one of the cases I quoted.

26751. I want to see the value of your opinion. Is that your opinion?—It is not my opinion.

26752. What has this boy got to do with the question of inspection?—I quoted one case that came under my knowledge to show that inspection was not efficient there.

26753. From the instance you have given to the Commission, you form an opinion as to the inefficiency of the inspection?—It was not from that single case that I formed my opinion.

26754. Then why do you give it?—I quote it as one case in particular. I formed my opinion from what I have seen generally.

26755. Is there anything better than that?—Yes, here is this case where the men did not get their timber because they had not paid their rent.

26756. Does the inspector know of it?—He ought to know, just as I do.

26757. How would he get to know?—I think that he should be sufficiently versed as to the condition of things underground in his district to know of these matters as well as I do.

26758. How long have you known of it?—For the last 12 months, and I have spoken against it at public meetings.

26759. Have you ever told the Government inspector about it?—No, because unfortunately that particular inspector holds such strong views that he has on more than one occasion attacked me for interfering with what might be called political questions; for instance, such a question as the reduction of the hours of firemen in the colliery.

26760. Surely a 1d. stamp would have taken this complaint to the inspector?—I think it is more effectual to speak about it at public meetings to which the miners are invited.

26761. The inspector is not invited?—He is invited to attend and has read the book giving these facts.

26762. Do you think that the inspector has read the book?—Yes, and he compliments me upon it.

26763. Have you put that in the book?—I do not think that particular case is quoted, but the other cases are here. It is simply a question of whether he has read the book, and he has done so.

26764. What is your experience as to the practical working of mines?—I have had 15 years' experience in visiting collieries, examining, searching, questioning, and generally that experience which a mining engineer would get.

26765. Do you mean actually doing the work of an examiner?—No, except I have done the work of an examiner in going round with him as an assistant and examining for myself.

26766. How long ago was it that you started on this work?—About 12 or 14 years ago.

26767. Is what you have put before the Commission from information given to you by firemen and examiners, and others?—And from information I have directly ascertained for myself in visiting the collieries, and in examining, searching and questioning, and doing the same as a Government inspector does.

26768. How come you to visit collieries?—I am a lecturer on mining and I should not like to lecture about things which I did not understand.

Mr. Henry Davies.

10 July, 1907

26769. Do you visit with the permission of the owners?—Yes, I get the support of the owners invariably in South Wales. They encourage me to visit the mines and put every facility possible at my disposal.

26770. You have a large number of reports from examiners or other officials?—That would only be with respect to the duties of individuals and their hours of work.

26771. The information which you give to the Commission is founded upon those reports, and your own experience as to how far those reports are well founded?—The information with regard to the hours and duties I have got directly from the men themselves.

26772. Your present work is as a lecturer on mining?—I am Director of Mining Instruction for the Glamorganshire County Council and Secretary of the South Wales and Monmouthshire Mining Education Board.

26773. (*Mr. F. L. Davis.*) Did you ever work in mines yourself?—In what capacity?

26774. In any capacity?—Yes. I call it working just as the Government inspector does to go round and examine and search. I do the same kind of work as they do, and I presume a Government inspector would call it working. I have gathered my experience as a Government inspector would do.

26775. Had you any position as an official when you were working in a mine?—As a collier.

26776. Yes?—No, but I do not think that would affect my knowledge. I do not think it would be necessary that I should have worked as a collier before ascertaining these facts, any more than anyone should be a navvy before becoming a civil engineer.

26777. I only asked you if you had been a collier?—I have cut coal, if that is what you ask.

26778. Not worked as a collier?—No.

26779. Nor as an official?—No; on the other hand I have had the same training as most Government inspectors and mining engineers. They do not start by working on the coal.

26780. Did you say how long you had been visiting mines and getting the information which you are now using?—Yes, 15 years.

26781. You stated generally that the hours of the firemen were too long?—Yes, from the knowledge which I have here and which I can substantiate with the returns which I have. They run up to 12, 12¼, 11 and 13½ hours, and I think that the duties they have to carry out are too many.

26782. All over Wales do you say that the hours of the firemen are too long?—I would not express an opinion with regard to Pembrokeshire and Denbighshire, but as regards Carmarthenshire, Glamorganshire, Breconshire and Monmouthshire, I should say that they are too long from personal knowledge.

26783. In cases where men have complained that the hours are too long—I do not know whether they have done so—do you happen to know of your own knowledge, where the firemen have complained, that the management have met them?—Yes, I understand, and I want to be fair, that the general manager of the Ferndale Collieries has promised the men that he will give them the eight hours' shift before the Legislature will probably, or possibly, make it compulsory. The men, when they waited on Mr. Hannah, the general manager, were met favourably, and, although he did not specifically promise to give them eight hours' he gave them to understand that he would favourably consider the matter before it came before Parliament.

26784. I suppose you mean re-arranging the districts and hours?—Yes, in the other case also—Lewis Merthyr—the eight hours shift is in operation with excellent results.

26785. An eight-hour shift for firemen?—Yes.

26786. What is your opinion of the firemen, generally, in South Wales, I mean as to their competency and intelligence?—So far as intelligence is concerned, it is very much higher in South Wales than I have seen in Belgium, Germany, or America or Somerset. I believe if they had more opportunities of studying they would keep up-to-date, and, I believe, read the Government inspector's reports and the reports of this Commission. They are unable to do so at present, because at the end of a 12 hours' shift they are too tired to study.

26787. You have no complaint as to the competency of the firemen in Wales; your point is that the hours should be shortened?—Yes, shortened, in order to permit them to exercise that competency which they possess.

26788. This custom of tipping, or paying rent, you mentioned just now is rather new to me. That is not a general thing, I understand?—No.

26789. You would not say it is general throughout South Wales?—No, because in some co lieries where it did exist it has been stopped by improved supervision.

26790. What is your objection to that? What is your point with regard to it?—Where a collier has to pay tips to a haulier, he not only gets the preference of the first tram, but the haulier, too, gives the man the preference as to the best timber, and the first timber. When a man in Monmouthshire has not paid his "rent" this is what happens: the examiner comes round and finds a man has not stood a post where it ought to be stood, and then the poor collier complains that he had no post, and, possibly the boy has to go a considerable distance to look for it. Then the examiner turns to the haulier and says, "Why did you not bring this man a post?" and he replies, "He did not pay his rent last month." With improved supervision such a thing would be impossible. If a fireman had his attention directed to that instead of the number of rubbish trams which were being filled we could do away with the system.

26791. That is an arrangement that takes place between the hauliers and the colliers?—Yes, with the knowledge sometimes of the management, but the hauliers' wages would be so arranged that it is unnecessary to take tips.

26792. Whatever the regulations may be, can you prevent one haulier favouring a collier who happens to be a friend, apart from tipping?—One can make the tips unnecessary and the favouring an impossibility.

26793. That is an arrangement between the men themselves, sometimes with the knowledge of the management and sometimes without?—In this case I would assume as you do not know about it that it would be without the knowledge of the management or the owners.

26794. Do you think that any steps should be taken by the Federation and by the men's leaders?—Yes, I believe that every Federation Lodge should set its face very strongly against the continuance of a system of that kind. I believe that the management and the Federation Lodges could succeed in stamping it out. It is difficult at present because the management do not give that possibility for supervision which is necessary to prevent it.

26795. Do you know if any steps are being taken by the Federation. First of all, have you taken any steps to bring that to the notice of the Federation?—Not to the Federation, but to the miners themselves. I have spoken publicly against it. The lectures I give have been reported in the papers, but in some cases the officials deny its existence, although, I think, a salutary effect has already been produced. More people know of its existence now than knew originally. One member of this Commission has appealed to the men at the Annual Conference and asked all the miners and other workers to act as underground police, each to safeguard the life of the other. That was at the Federation Annual Meeting at Cardiff.

26796. And very good advice?—I want to repeat it once a quarter for 10 years and then, I think, it would be effective.

26797-8. How long have you known this system of tipping? Is it any thing new, or has it been to some extent existing for many years?—It is a very old custom, and it is less prevalent now than it was.

26799. On the subject of inspection you said your complaint was not against the inspectors as inspectors?—In the case I quoted relating to the lamps it is against the inspector, specifically.

26800. Generally speaking, you have no complaint against the inspectors, but against the system of inspection?—That is so.

26801. You also said you would have two inspections a year instead of one?—Yes.

26802. What is your opinion of thorough inspection?—Inspection such as to secure an application in its entirety of the Coal Mines Regulation Act and the General Rules and the Special Rules. At present it is impossible for an inspector who visits a colliery possibly once a year, or once

Digitized by Google

in two years, to see that all the provisions of the Coal Mines Regulation Act are enforced.

26803. If he visits twice a year do you think he would be able to then ?—He would have twice as many chances.

26804. He can only then see what is going on when he visits the mine ?—It depends on the individual. He ought to see twice as much in two visits as in one.

26805. You do not think that the inspector should take any responsibility off the manager of the mine by frequently visiting the mine ?—No, I no not want to make him jointly responsible for the management of the mine, but I want to make him responsible to the Home Office for the efficient application of the provisions of the Coal Mines Regulation Act. Unless he visits fairly frequently he cannot see that its provisions are carried out.

26806. Surely he cannot be sure that the provisions are carried out unless he is there every day and every hour, can he ?—No, neither can a manager in a lesser degree, because he is not there the whole 24 hours.

26807. I agree ?—But the inspector can, by visits without notice, see better if he goes twice a year than once a year, that his instructions are carried out. If he goes in January and does not visit again till the following January he is not able to see whether the recommendations that he suggested in January are carried out or not during that 12 months.

26808. If the inspector were to be there at least twice a year that would be very much better than it is at the present time ?—Yes. I do not say it would be a perfect cure. So much depends on the individual. He would have twice the opportunities of seeing if improvements were carried out if he visited twice instead of once.

26809. Did you make a recommendation with regard to the fireman's duties; I mean with regard to measuring the air ?—Yes.

26810. What is your suggestion ?—I believe that it should be one of the duties of the colliery examiner to measure the quantity of air passing through his district at least once a fortnight, and also measure the percentage of gas at the last working place in each split once a fortnight. That should be part of the fireman's duties rather than measuring the work done by day men and keeping an account of the number of horses employed, and the work done by labourers, and the number of rubbish trams filled. I think it would lead to a reduction in the number of accidents if he were called upon to carefully measure the air and record the percentage of gas present. I do not object to this being done by the management for other purposes, but the fireman should be educated to make those records themselves.

26811. (*Dr. Haldane.*) You are not satisfied with the present provisions of the Act with regard to measuring the quantity of air. The Act provides that the quantity of air in the respective splits shall be measured at least once in every month ?—I believe that it should be done every fortnight, and at the same time not only the quantity but the quality of air-current should be measured as well.

26812. (*Mr. F. L. Davis.*) Do you mean to take that out of the hands of the manager and make it part and parcel of the Coal Mines Regulation Act that that work should be done by the firemen ? How would you carry it out ?—I would hold the manager responsible according to the Act for the ventilation of a colliery, and for the safety, as the Act stands at present, but I would put it as one of the duties of the fireman, so that the manager might measure for his own purposes once a fortnight, but that this examiner should take so much interest in his work that he could measure the quantity and quality of the air current.

26813. You think that is advisable. You do not go so far as to suggest that that should be in the Coal Mines Act ? —The Act says the place has to be examined every day before the men go in. I do not see why, since the examiner has to measure the percentage of gas daily, he could not do this other work fortnightly.

26814. The manager at the present time can decide. He can appoint anyone he likes to do that particular work, whereas you want the fireman to do it ?—I want the fireman to hold the responsibility, not to the Home Office but to the manager.

26815. You have told us that you go about the country giving a number of lectures on all sorts of questions relating to mining, particularly with regard to safety having regard to the precautions for preventing accidents ?—Yes.

26816. Assume an ideal colliery, and an ideal manager, and all the regulations being carried out according to the Coal Mines Act in proper form, then you would say that there would continue to be many accidents occurring ?—It would be impossible to make a condition of things so perfect as to make an accident impossible, but I believe we can aim at making them impossible, and in aiming at making them impossible we will succeed in getting an approximate remedy—or approach the perfect.

26817. Many accidents occur although the management has done everything it could, through carelessness of the men. I am not putting any more blame on to the men than must be put, I think ?—Is your point that some accidents still continue ?

26818. In spite of all the management do to prevent them?—I do not know of more than one case at present where the management has done all that is possible to prevent the accidents.

26819. That is a matter of opinion ?—You should fairly have given these men—the firemen—opportunities for carrying out efficiently the duties entrusted to them, and until you do that you have not done all that is possible. I hope you will pardon the attitude I take in regard to this question.

26820. You would agree that a number of accidents occur owing to the carelessness of the men not taking all precautions for their own protection ?—Yes. At the same time the owners have not taken all the precautions possible for their protection.

26821. In your lectures you try to bring that to the notice of the workmen ?—Yes.

26822. You impress upon them the necessity of taking precautions to protect their lives and the lives of the other men ?—I address the men with regard to the timbering and speak very strongly against procrastination. Then the men ask me what I am paid by the officials for attacking them so severely. At other times I censure the officials for acts I consider wrong, and they accuse me of playing to the gallery. My position is thus rather an interesting one. But I do what I consider right, and attack the whole system when I consider it wrong.

26823. You think by your lectures and the men's agents constantly bringing before the men the importance of considering their own safety and that of others that may do good and prevent accidents in the future which occur now owing to their carelessness ?—As far as Glamorganshire is concerned, the Federation Lodges already invite lectures on the cause and prevention of accidents. They put up notices at the pit-heads: they pay the cost of the lectures as far as publishing and providing the room are concerned. The Federation Lodges of Glamorganshire are practically doing all that is really possible in that direction.

26824. Your particular work, you believe, does a good deal towards preventing accidents ?—I am hoping so. Sometimes I feel depressed as there does not appear to be much fruit as yet, but I believe the work is productive of increased intelligence and mental activity on the part of the men, and that will gradually reduce the number of accidents.

26825. (*Mr. Wm. Abraham.*) Going back to the question of effective and thorough examination, will you explain further what you consider to be a thorough inspection ? Is it a kind of inspection a mines inspector does, or a workman inspector, once a month?—By efficient inspection, first with regard to examiners or firemen, I mean such an inspection that will make reports on details possible. Now, for instance, in one colliery the examiner starts round his district, and his district is so large that he is unable to cover it, and the haulier does a portion of the work for him. The examiner reports the work done by the haulier in a district which he himself has not seen, and possibly shot-firing will be carried on in that district. Inspection by examiners or colliery firemen should be such as to enable them to say, when there is an inquest after an accident, what was the percentage of gas in a certain district six months back. I want the examination by the fireman to be such that he can draw a curve showing the percentage of firedamp present, and that curve would follow the ordinary barometer curve, that is made automatically every day. If the firedamp curve is made fortnightly, we would have valuable information at the time of the inquest as to the relation between the barometrical curve and the firedamp curve, and the exact percentage of gas in a mine six months before. That information can be got with very little trouble, and the attempt at getting it would amply repay for the trouble and time taken. It would make the man take more real interest in the work itself.

26826. That is an examination which would require more technical knowledge than this body of examiners

Digitized by Google

Mr. Henry Davies.

10 July, 1907.

generally possess?—Not much. With an ordinary blue cap they manipulate the flame carefully and practically. With another kind of lamp that manipulation, which takes two or three minutes, would be unnecessary. You would have a scale at the side of the flame, and by another kind of flame the fireman could tell the actual percentage of gas present mathematically, instead of according to his own eyesight, which might be perfect or impaired, and, according to his opinion the percentage of firedamp present would vary.

26827. For the assistance of the examiner you would have a lamp specially made in order to enable him to measure the gas easily?—Yes.

26828. Would frequent inspection of the mine made by the workmen themselves assist us in the direction of reducing the danger in the mines?—Yes. I believe that the report of the workmen inspectors, if presented to the Federation Lodges, would so rouse the interest of the men and the leaders in the actual things as to seriously reduce the number of accidents.

26829. You know from your own knowledge a number of South Wales collieries?—Yes.

26830. Take one of the large valleys of the Rhondda. There is Lewis Merthyr, Cymmer, Gelli, the Ocean and Ferndale. How many days would it take a person to make a thorough inspection of such a colliery?—Do you mean one person.

26831. Reduce it to four, or half a dozen. You are talking of a thorough examination?—Yes. If you took a large colliery where there are 1,500 men employed, it would be impossible to get an efficient inspection of that colliery in a day. The Government inspector, as a rule, spends about half a day under ground, but to examine or efficiently inspect a colliery of that kind would require at least several days on the part of one man.

26832. In order to get a thorough inspection done by the Government officials it would require a great number of men, but not of the highly technical training that the inspector possesses at the present time?—Quite so. The Government inspector frequently has to report upon winding engines, hauling engines, ventilating machinery, and pumps. That has not so much to do with the actual working dangers of the mine. There should be an inspection of a different character with regard to the inner workings of a mine, which could be carried through by men of a different type, possibly what we might term more practical from one standpoint, that is, the ventilating current, the percentage of firedamp present, systematic timbering. I believe, then, there should be an inspection of the workings themselves by men of a standard less high than that of our present Government inspectors, and yet that inspection for practical purposes would be thoroughly efficient.

26833. Do you recommend that there should be another grade of inspectors?—I believe that, should there be a possibility of increasing the number of the present staff it would be an advantage; but, seeing that it is almost impossible to expect a great multiplication of men of the same calibre as we have now, I would certainly recommend the other as the only possible means of securing thorough inspection.

26834. (*Mr. Enoch Edwards.*) Do you mean by "impossible" a question of cost?—The public purse. It is only a question of cost. There is a plentiful supply of men and talent, I believe, but I am simply thinking of the question of cost.

26835. (*Mr. Wm. Abraham.*) You have occasionally seen the reports made by the workmen that are appointed by the men to examine these collieries?—Yes.

26836. Do you consider that the examination, generally speaking, is a satisfactory one, or comes as near to thoroughness as the others?—Yes, as far as the practical operations in the working part of the mine are concerned I believe that the inspection by the workmen, where the workmen are competent, is more effective for practical purposes than the other, because, first of all, not only is the inspection itself better, but the report is discussed at the Federation Lodges, and there is a considerable interest taken in the condition of the mine. I believe that possibly in the future these reports will be made so as not only to have a bearing on the condition of the air and the supply of the timber, but that the workmen themselves will report to the Federation Lodges any man who neglects setting timber, or is guilty of procrastination in that direction.

26837. What position did you occupy before the present one?—I was head master of a large primary school, and I found that in my evening classes I was teaching the lads of a mining district that the word lamp was a common noun of neuter gender, singular number, and of a particular case, whereas I did not teach a boy how to handle his lamp, and I thought that was more important than to teach him that the word was a common noun.

26838. Why did you resign that position?—Because I had not the opportunity of teaching the boys how to properly use the lamp. I gave up my position to do so.

26839. How did you get your knowledge of mining?—I visited the mines in the night and in the morning. I visited all the mines in the neighbourhood, and, after visiting those of my own county, I visited the mines of Somerset, Cornwall, those of Belgium on more than one occasion, and those of Germany and America.

26840. To what extent is your work supported by owners, officials and workmen in South Wales?—I find this, that the more intelligent the manager the readier he is to support these classes. He is not afraid of his subordinates being made intelligent and up-to-date, but with regard to the less intelligent manager, I have more trouble to get him to support my classes. There is only one case where I have not been freely supported. As I have previously stated, when I deal with the question from the workmen's standpoint, occasionally I am charged with taking a partisan view of things from the workmen's position. If I speak of neglect of timbering very often the men think I am paid by the owners.

26841. You have told us that before?—That is the only point there.

26842. Do you receive general support?—Yes, I find that the men who gain their certificates in the classes are almost invariably promoted. There are a few isolated cases where they are not promoted. These men may have their certificates but do not possess other qualifications necessary in a good official.

26843. You have referred us once or twice to your having knowledge of mines in Belgium and Germany and in America. By what authority did you examine these mines?—With regard to the German mines we got an introductory letter from the Foreign Office—thanks to the services of one of the miners' representatives from Glamorganshire—and that enabled us to get into some of the German State mines.

26844. (*Chairman.*) Whom do you mean by "us"?—Myself and a body of students attending these evening classes. We take on these tours as many as 30 or 40 mining students to different parts of the country. On Saturday I take 30 men to the German mines.

26845. (*Mr. Wm. Abraham.*) Do you mean this next Saturday?—Yes, every man who goes on tour this year has to make a special report on timbering in all the different coalfields of this country and where we visit the collieries abroad.

26846. (*Chairman.*) Your pupils next Saturday will bring forward a report here on the German system of timbering?—Yes.

26847. You make them report on German timbering?—That is a special feature. They have to report generally. This is a copy of the report made by these students last year.

26848. You have several reports on German timbering already?—Yes; we have to get it more in detail this year. The last time they reported generally.

26849-50. (*Mr. Wm. Abraham.*) To what extent are ambulance classes supported in South Wales?—We have a very considerable number of students attending our ambulance classes. In Glamorganshire we have at present 52 separate classes with 1,381 students in regular attendance. The result is that at some of the collieries I visit there are as many as 100 men competent to render first-aid in the mines. These men are distributed through the various districts, their names are put on a board, and in one colliery there is a box with all the necessary apparatus for first-aid in each district. I would like to see that plan generally adopted so that we could get not only a competent first-aid man in the district, but also the appliances which he would find necessary to use.

26851. Do you find among the men themselves a readiness to be taught and to learn what is necessary for first-aid?—Yes, there is a very great desire and, even now, there is considerable enthusiasm shown with regard to the formation of proposed rescue brigades. We have been waiting until last month for the report of this Commission

Digitized by Google

as to the best rescue apparatus. As soon as we have time to study that report we will establish rescue brigades. There is a keen desire on the part of the workmen to become members of rescue brigades.

26852. That kind of thing is well supported by the owners ?—Yes.

26853. Between them both you think that some considerable advantage will result from the classes going on at present ?—Yes, further than that, I believe that possibly the training of the men themselves will be one of the best means to make accidents practically impossible or to make the need of their help unnecessary. The training will make the men more intelligent, and this will be a preventive of accidents. So that I think the training will repay, apart from its need, when accidents occur.

26854. Has anything been done to establish rescue brigades ?—Yes, we had a conference at Cardiff of owners, officials and workmen and their leaders, and the greatest enthusiasm was shown, and it was decided then that as soon as possible these brigades should be established, and I have no doubt that at the beginning of next winter we shall have a number of men under special training in our district.

26855. You have been labouring largely among the colliery examiners ?—Yes.

26856. You have held meetings with them. Have you any special reports you could put in here, if necessary, to show what is really happening, and what hours these men are working. Have you any authority by which you can support that ?—Yes, I sent out a circular some time ago because I was asked by the authority under which I work to give a series of lectures on the cause and prevention of accidents. The first thing I did was to enquire as to what was the real cause of many of these accidents, since I had to address colliery officials. As the result of 200 or more returns I received I compiled a table, some portions of which you will find in this book. These returns are, I believe, from what I have been able to check afterwards, absolutely correct. The men were told "You are requested to exercise the greatest care in answering the questions so that they may be perfectly correct," and in order to get the information for certain I arranged a slip whereby the names could be cut off and only the forms supplied.

26857. Supposing the Chairman wants to know, could you give him the names of men and names of collieries where the thing is done and men who have actually gone through that experience ?—I could give the Chairman the names of the men and the collieries referred to in this book where the table is produced. I have them here, but they were given to me under a promise that they would not be divulged.

26858. What induced you to take up that work of assisting these colliery examiners ?—I was instructed to give lectures on the cause and prevention of accidents, and the first thing I had to do was really to find out what I thought to be the real cause of a number of these accidents, and I have come to the conclusion that a number arise from a lack of efficient supervision, and during the whole of the remaining course of the lectures I dealt more particularly with accidents that did arise from a lack of efficient supervision.

26859. Would you recommend that overmen at collieries should become certificated or pass some examination by some competent authority to qualify them for their duties ? —It may be considered advisable to make every official pass an examination, but it ought to be considered necessary that a fireman should. You already make it necessary for the manager and the under-manager of large mines to pass an examination. They have to deal mainly with the traffic and the output. It is therefore necessary that a man who has mostly to deal with the safeguarding of life and limb should also have a certificate in that direction.

26860. Do you wish to have the air examined every fortnight by the examiner with an improved lamp ? I think you have told us that. Where would you have it measured ?—I would have it measured, as far as the percentage of gas is concerned, in the last working place of each split. That would make it, I think, a rule that would be practicable, and the results would be reliable and worth recording. If you measure it in other places, the place might be varied with the views of the men, but if the examiner is told that he must measure it and record its quality in the last working place you would know what kind of air the workman would be working in.

26861. You have suggested also that you would have the traffic on the main road suspended while men are going in and out. What would be the result, do you think ?—It should be suspended unless there is a definite and safe travelling way, but the first result I think would be this. Apart from the reduction in the number of accidents on haulage or engine planes, which are pretty high now and frequent, this would be the result. If the men in the working places knew that the whole of the haulage would be stopped for 20 minutes or half an hour, or less, they would be more likely to leave their working places and come out. Now this is what happens. The shotsman starts at one end of the district; he assumes that all the men from that district have come out, but, unfortunately, they have not come out. They may be putting their places ready for the next day, and they may actually stay in their working places while shot-firing is going on at the other end of the district. If traffic was stopped, there would be one additional inducement for the men to get out at a specified hour in addition to the safety of the haulage road itself.

26862. That would, in your opinion, be a distinct advantage ?—I have no doubt about that.

26863. You are not satisfied with the system of examining for manager's certificates ?—No.

26864. How could that system be improved. What is against it ?—At present a man who receives a premium from an articled pupil may also be the examiner of that pupil for a certificate of competency from the Home Office.

26865. Is that an assumption on your part or is it a fact ?—It is a fact that there are mining engineers who receive premiums from pupils acting as examiners on the examining board. Then this is the danger: where there is rivalry between two mining engineers of a town, friction might easily arise in that direction; consequently, although the examiners may be above reproach and excellent men, as I have no doubt they are personally, yet they lend themselves to an attack in that direction which might be unnecessary if the system were improved. Another cause of dissatisfaction is this: a man may become a colliery manager for South Wales after failing to pass the examination for South Wales, but by passing one at Manchester, Wigan or Glasgow. That seems to me absurd. A man may not know the Special Rules of South Wales and yet he may go to Manchester or Wigan and pass an examination and come back to South Wales as a manager. The owners, we assume, will take the necessary precaution, but I want to make such a thing impossible.

26866. (*Mr. Ratcliffe Ellis.*) Do you say that a person who is going to be a manager in South Wales should get his certificate in South Wales ?—No, I say that a man who fails to pass the examination for his own district and sits for an easier examination——

26867. Or another examination ?—You assume it is harder but I assume it is easier because I know a man who failed in Wales and pulled through in Manchester. It is wrong for a man to manage a colliery in Wales when he has failed to pass the examination for the South Wales district.

26868. (*Mr. Wm. Abraham.*) What makes him incompetent if he has passed a certificate of competency in Manchester where there is also a necessity for him to be a competent man. Why is he not competent in South Wales ?—I would ask you the question, why is it necessary to have an examination for South Wales at all ?

26869. (*Chairman.*) If he fails in South Wales, between times he may get enough knowledge to make him pass in Manchester an examination just as difficult as South Wales for that matter. You are only talking of the question we have had before us over and over again, as to how far there ought to be one examination for the whole Kingdom or a special examination for each district, and that nobody should be allowed to be a manager in that particular district who had not passed the examination for that particular district ?—Yes, partly. I want a uniform standard for the whole country for the first-class certificate, and then I think that a certain amount of local knowledge should be added to that.

26870. (*Mr. Wm. Abraham.*) It is essentially necessary that a manager should know the rules of a district ?—Yes.

26871. The Special Rules ?—Yes. There is another position. A man may get his five years' experience possibly in a mine that is only giving off carbon dioxide gas, but he becomes eligible at once to manage a colliery giving off firedamp. Again, a man may have spent five years in a little level with only the mechanism of a shovel and a tram and become a first-class colliery manager and

Digitized by Google

Mr. Henry Davies.

10 July, 1907

be eligible to take a position as a manager in a large colliery. Something should be done to make such things impossible. When a man has only five years' experience in a small level without any firedamp being given off he is not competent with that five years' experience to manage a large colliery, but according to the Act of Parliament he is qualified.

26872-3. What improvement would you suggest in that case ?—I should lay down certain qualifications in each district in addition to having five years' experience. The candidate should not only have five years' experience but particular experience in the kind of mines in the district where he intends becoming a manager.

26874. Have you dealt with the question of a knowledge of the Welsh language being necessary in Welsh mines ?—No, I have not dealt with that, but I hold that view.

26875. (*Chairman.*) I asked the question because I noticed that the witness had put it in his statement, and he said that a knowledge of Welsh was very essential ?—Yes, but I did not go into the details. I wanted to show how, for instance, a fortnight ago there was a miners' conference and inspectors were present, and that conference was conducted entirely in Welsh in Glamorganshire. The chief inspector did not understand what was going on. I think the mines inspector for that district ought to know the language generally used by the men for his own advantage and for the advantage of the Home Office. He might get information through an interpreter but that would be like pumping information out, instead of leaving it bubbling out of a fountain.

26876. (*Mr. Smillie.*) Why was it carried on in Welsh ? —Because they were Welshmen.

26877. Could they not speak English ?—The terms were Welsh and the surroundings were Welsh, and when they discussed in Welsh they were speaking their native language.

26878-9. It was not in order to make it impossible for the inspector to know what they were saying ?—No, there was an assistant inspector there who understood Welsh, and the chief inspector had to get his information through the assistant inspector. I think the chief inspector himself ought to be able to get the information direct.

26880. (*Mr. Wm. Abraham.*) You have spoken very strongly with regard to the timbering. What would you suggest with regard to the timber ?—What happens now is this, a fireman or overman goes round and finds a man has not put in sprag ; he cautions him but owing to his many duties he goes on and has not time to see that his instructions are carried out. If his duties were limited he would be able to come back and see that the instructions were acted upon. Possibly at the end of the Special Rules or on a board in the workings some diagrams could be put giving examples of good and bad timbering. Now the boy who works with the collier has to learn from a man who does the thing improperly. If there were diagrams showing how good timbering should be adopted and also the danger of bad timbering they would appeal to the eye and assist the memory. I have some diagrams that could be put up on the notice-board and the boy would not copy the bad things but would see the right way of doing it.

26881. Do you think that improper timbering is prevalent in South Wales ?—Not prevalent, but I believe it is occasionally found that a man does not know that he should stand a post at right angles to the dip. I sometimes find a man who uses a pick or a mandril to trim his lid instead of a hatchet.

26882. What kind of a trimming could he make of a lid with a mandril ?—A very poor one, but the danger is this, the boy sees that done. With better supervision this bad example would be impossible.

26883. Do you agree with the system of men preparing their lids in the working places or do you think that it would be an improvement if a certain number of lids were prepared and simply shaping them to a dip there left to be done ?—I think that second suggestion is the better one as far as the colliers' time is concerned. If they were prepared and he had simply to trim them he would be more likely to use them quickly than if he had to prepare them altogether.

26884. (*Dr. Haldane.*) How far has the system you advocate of giving instruction in colliery matters in primary schools been successful. Can you really teach these children ?—Yes, it is most interesting, for instance, here is a little book that they read. It is full of pictures and naturally the lads get interested. In a Welsh district the boys would have a lesson on the safety lamp by a teacher and they would go home and question their father or their brother or the lodger as to what kind of a lamp he used, or as to what kind of gas there was in one colliery and in another. With regard to the Special Rules, the boys would go home and ask questions of the lodgers and their fathers, and occasionally the fathers could not answer them with the result that they would come and ask questions in the evening classes. Through the boys we get to the homes. What faces a boy at the colliery immediately now is "No admittance except on business." He does not learn anything excepting to go quickly down the shaft and take the shortest cut to the stall. If he has his curiosity aroused he searches for himself and gets interested.

26885. Are things taught by showing the boys collieries, by taking them underground, or anything of that sort ?—They are taken periodically to the top of the colliery yard, and then they are taken underground. It is all taught in the school.

26886. Are they shown, for instance, the safety lamp ? Are they shown a cap ?—Yes, in the lamp room. They are taken to the lamp room and the lamp man is there making a test, and the teacher explains the principle. We supply them with a number of lamps and apparatus of that kind.

26887. It is evident that will give a lot of knowledge that will conduce to safety in mines ?—Yes.

26888. You recommend that records should be kept of the firedamp in the air ?—Yes.

26889. At the end of each split at the last working place ?—Yes.

26890. I suppose that you would also recommend there should be some maximum standard of firedamp in the air ?—Yes. As far as the Coal Mines Regulation Act is concerned, where it says an adequate quantity of air should be supplied—what is an adequate quantity ? It is a difficult matter to decide. The presence of a blue cap on an ordinary safety lamp is indicative of danger, and that there is not an adequate amount of ventilation.

26891. In your experience, is a blue cap common in the last working place in a split in a Welsh mine ? Have you often tested for it ?—I do not say that it would be common, but with increased care I say that it would be less likely to be seen. I do not mean to say that ventilation at present is inadequate, but if there was increased interest taken as the result of my recommendation I say that it would be improved.

26892. (*Sir Lindsay Wood.*) You said you sometimes took a party of boys to the mine itself to explain the character of the mines ?—Yes.

26893. And down the mine ?—Yes.

26894. Is that done by the sanction of the owner?—Yes.

26895. Who went with them ?—The teacher in charge of that particular class—the overman or the manager, or an official of some kind.

26896. Do they go all round the mine ?—No, it would not be necessary—the bottom of the shaft and the lamp room. We take them to the lamp room.

26897. On the surface ?—Yes.

26898. I thought you said that they went down the mine ?—Not at the school age, but immediately they left the school we took them underground. We take the boys of the evening continuation school, and technical classes.

26899. Who is "we"—your staff ?—Yes. We have about 70 classes, and these classes are conducted by a number of lecturers for advanced work and a number of teachers for elementary work. They have to visit the mines at least three times in the session to make the instruction thoroughly practical.

26900. Do the teachers of these schools take the boys to the mine and then go underground with them ?—Of the evening continuation school, but not of the day school. They keep the day school boys to the surface, but the evening continuation school pupils they take underground.

26901. They go round the mine ?—Yes.

26902. Whom with ?—The fireman, the overman, and the teacher.

26903. Is that a system in vogue in South Wales ?—Not in vogue generally.

26904. Do you not think it is a dangerous experiment ? —No, these boys would be 14 to 16 years of age.

26905. (*Mr. Wm. Abraham.*) It is approved of by the

Digitized by Google

management ?—Yes, and encouraged. The officials, as a rule, are the teachers of the class. We get a good intelligent under-manager, or a good intelligent overman, and if he satisfies us as to his scientific knowledge we put him to teach the class in order to make the teaching thoroughly practical.

26906. (*Sir Lindsay Wood.*) What does he teach them underground ?—How to avoid the ropes.

26907. The art of testing for gas, or what ?—He teaches them about the gas in the lamp room at the surface.

26908. What does he teach them underground ?—About the system of haulage, the nature of the arches and the roadways in general, the application of the Special Rules, the system of timbering, the methods of working longwall, double road, &c.

26909. He lectures underground ?—Not exactly lectures. If we are going to Germany——.

26910. Will you please keep to Wales ?—The instruction is exactly the same. As soon as we get to the bottom of the shaft we deal with the haulage, the arching, and the rules with regard to safety. Then we go to the lamp locking station or deal with the methods of haulage ; then we go to the haulage engine room and describe the engines and the nature of the power, whether compressed air, electricity, or steam ; and from there we go to the working face and deal with the character of the seam.

26911. Is this all done underground ?—Yes.

26912. With a party of 30 or 40 ?—No.

26913. I thought you said so ?—There would be two or three men in charge if we had 30 students, and there would be separate batches.

26914. Is that done during work time or on pay Saturday ?—Sometimes on pay Saturday, generally evenings; night shift when there is less danger.

26915. When the pit is not working ?—There would be a few men working at the coal face, but there would be plenty to explain the system of working.

26916. You said that you found some managers who were more ignorant than others, and who were more difficult to deal with in these matters ?—I think I said less intelligent. I did not assume that they were ignorant.

(*Sir Lindsay Wood.*) Very well, I will take your word.

26917. (*Mr. Smillie.*) Did you say they could not be more ignorant ?—I said that where I found the intelligence was the greatest the readiness to assist the pupils was also the greatest, and where the intelligence was less then there was not so much interest taken in advancing the pupils to pass the examinations.

26918. (*Sir Lindsay Wood.*) What authority do you hold to communicate with the managers in this way ? —In what way ?

26919. Do you make a personal application to the manager or have you any authority from the County Council of Glamorganshire ?—We have never at present thought it necessary to get any authority. My applications are sufficient, I think, at present. We have never found any difficulty. No one has asked me by what authority I visit the mine. My visits are welcome because I do my best to increase the intelligence of the workmen, although it is necessary sometimes to blame the officials. They have never asked me for any authority, and they welcome my visits.

26920. You do not hold any authority from the Glamorgan County Council for this work ?—I do not understand your question.

26921. I do not know what position you are in ?—The Glamorgan County Council could not give me authority.

26922. You are a lecturer in mining of the Glamorgan County Council ?—Yes.

26923. You are a paid official of theirs to carry out certain instructions ?—Yes.

26924. To give lectures and so on ?—Yes.

26925. That would not authorise you to go to collieries ? —No. There is no public body who would have authority to empower me to visit a colliery in that way that I know of.

26926. I should have thought not ?—It is unnecessary. The interest taken in the work is such as to make any authority unnecessary.

26927. I thought that you had some official position ?—By which I could demand authority ?

26928. Yes ?—It has not been necessary to demand permission to enter, my visits are always welcome.

26929. Your position is to lecture on mining ?—I am a director of Mining Instruction for the Glamorganshire County Council.

26930. I thought it was rather that of criticising the working of the Mines Act at present ?—I beg your pardon. I criticise much, although I am a director of mining instruction.

26931. So I understand ?—Certainly, that is my duty. If I am asked to lecture on the cause or prevention of accidents, whether the cause comes from the collier or the Government inspector, I will point it out.

26932. I only want to know what is your position ?—I am a free lance in that direction.

26933. You stated that examiners ought to examine the percentage of gas at the end of a working place ?—Of each split.

26934. And record the percentage of gas in it ?—Yes.

26935. How can that be done ?—By an ordinary Clowes hydrogen lamp.

26936. That will not give you the percentage ?—It will give us a scale by means of which we can read the percentage.

26937. You will not get much of a result from that ?—I have made some tests and I am satisfied that it is much better than the lamp we use at present. We cannot tell the percentage by the ordinary lamp the firemen use now. It is more or less guess work.

26938. Is it done at all in any mines ?—Yes.

26939. Where ?—Mountain Ash and Merthyr Vale.

26940. They measure the percentage of gas in the air every month ?—Yes, and if it can be done there it can be does elsewhere.

26941. That is recorded in that book. That is not necessarily by the Mines Act ?—No, but it is done in the main return airway of Nixon's Mountain Ash colliery every month.

26942. You said that you had to give a lecture on some point and that you sent out returns for information. Were those returns sent to the colliery owner or to whom ? —I do not think that you have understood my answer. I was asked to give a series of lectures to colliery officials on the cause and prevention of accidents, and the first thing I did naturally was to satisfy myself as to what were really the most prevalent causes. In order to satisfy myself I sent out a series of questions, and I got them answered, and I was convinced to a certain extent as to the causes.

26943. To whom were the returns sent ?—They were sent through the Secretary of the Association to me.

26944. What association ?—The Colliery Examiners' Association. The reason why I did that was this.

26945. What we call the Deputies' Association ?—Not exactly your deputy. These are not the men looking after the timbering.

(*Mr. Smillie.*) The deputies in Durham are the firemen.

26946. (*Sir Lindsay Wood.*) You mean the Firemen's Association ?—I could not get at the men unless I got at them through some Association. I would not know their names for the whole coalfield, so I had to employ the secretary to distribute the questions, otherwise I could not get at the men.

26947. (*Mr. Smillie.*) They were not got through the owners or managers, but through the examiners and the deputies ?—I have them here, perhaps you will understand them better if you see them.

26948. (*Sir Lindsay Wood.*) I did not know whether you got them from the owners themselves ?—No, that would be unfair to the men, because they would not be likely to give those particulars through their superiors.

26949. It is equally unfair to the colliery owners if you get them through the men ?—No.

26950. Why not ?—We do not assume that the men would be untruthful.

26951. Do you think that the owners would be untruthful ?—I believe the men, if they had to send the reports through the owners, would not give me all the information that I wanted.

26952. If you had the reports direct from the owners— ? —I do not believe that they would give me all the information that I wanted. I think that there would be a considerable amount of information I wanted omitted.

26953. (*Mr. Wm. Abraham.*) That information you got is information open to the owners to criticise ?—Yes, here is the whole lot, but I had to promise the men that I

Digitized by Google

Mr. Henry Davies.

10 July, 1907

would keep the names myself, and only hand them to a person in whom I had confidence. I think that explains the position.

26954. (*Sir Lindsay Wood.*) I was not certain whether you got the returns from the workmen or from the owners?—I should not ask the owners; I do not think I should get them.

26955. They are not returns published in the inspectors' Reports?—No, they are published in this (*Producing book*), and open to the world to criticise.

26956. I do not know what you mean by this?—I am sorry, it is supposed to be very good.

26957. What is it?—A series of lectures I delivered.

26958. (*Mr. Wm. Abraham.*) May I put a question to assist you? The managers themselves actually take the chair at your lectures?—Yes, there is no friction in that direction. I got the information directly from the men.

26959. (*Mr. Enoch Edwards.*) You said, in answer to Mr. Abraham, that the firemen when making inspections in the morning where the district was too big, were assisted by the haulier?—Yes, in some cases.

26960. By whose authority does the haulier inspect?—I cannot really take upon myself to answer that question directly, but I know that it is officially known that the haulier does it. He is not appointed by the fireman to do work for which he is responsible, but it is done with the knowledge of the management.

26961. In the first place, who are the firemen appointed by?—By the manager.

26962. He is responsible for the appointment?—Yes.

26963. And their fitness for the office?—Yes.

26964. Does he give any authority to hauliers?—The manager?

26965. Yes?—That is a question involving some doubt.

26966. Could anybody else give authority but the manager?—Not authority.

26967. How do these men come to inspect. How do the hauliers come to inspect at all?—The haulier would be going down possibly for a night shift, and instead of doing straight some hauling work he would, for an hour or less, do inspection work.

26968. He is not a person appointed to do it?—No.

26969. Who is responsible for engaging him in such work?—The fireman is appointed to do that work officially and the fireman makes the report.

26970. There is no authority to delegate that business to a man who has never been appointed to such work?—That I cannot answer, but I know that it is done. Here for instance, in my book I find "Until lately did shot-firing during a shift." "I see to all repairs and proper supply of trams; I am responsible for traffic generally." "I have a haulier to assist me in making the gas examination."

26971 Is that common in South Wales?—No.

26972. You know that it is done?—I know that it is done.

26973. (*Mr. Ratcliffe Ellis.*) In that particular case you mention?—And in the others. This was a case I quoted.

(*Mr. Smillie.*) We had that evidence from an examiner from South Wales last week, that an examiner sometimes had another person with him and sometimes did part of the examination, and he signed for the whole district.

(*Mr. Ratcliffe Ellis.*) He called that man an assistant.

(*Mr. Smillie.*) He calls this an assistant, too.

(*Witness.*) He is a haulier.

26974. (*Mr. Enoch Edwards.*) What is a haulier's work?—To clear out the coal as it is filled, take in the timber and empties.

26975. Does he drive a horse?—Yes.

26976. He does not trim it himself?—Not in the cases I quote. He simply drives the horse.

26977. What is his wage, about?—I cannot tell you. I do not deal with the question of wages.

26978. He fetches the coal from the colliery face?—Yes.

26979. You suggest that he has power to levy tax upon the collier?—I do not say that he levies tax generally, but it is found occasionally that he does get a tip. I do not say that he levies a tax. Possibly it is a voluntary contribution on the part of the collier, and not a levy.

26980. I understood that if he did not pay it he did not get his trams?—That is the indirect way of putting it: where the tip is not given, the collier waits for his trams.

26981. He has the power to levy?—Yes, if he chooses to exercise it.

26982. If he does not pay he does not get trams or timber?—We should not put it quite so broadly as that. There are cases now where the tip not having been given the timber also has not been supplied at the time it was wanted.

26983. I have been in the world a few years, and I never knew of such a thing. That is why I am putting this phase to you. You suggest to us that in the all-important question of timbering being in a man's working place, that this haulier not having any tip will not take the timber?—I do not put it so strong as that.

(*Mr. Smillie.*) He would give the man the first timber.

(*Mr. Ratcliffe Ellis.*) It comes to the same thing.

26984. (*Mr. Enoch Edwards.*) I understood you to say that the collier having failed to pay the haulier his demands, to pay this tip, you call it, 6d., 1s., or 2s. 6d., the other man takes his timber in preference?—That is the point.

26985. The result is that the man does not get his timber when he wants it?—He does not get the first chance.

26986. Does it follow that he is without timber?—It is necessary that he should have timber.

26987. Will it follow because the other man who has given the tip has the timber, that the other man may be wanting timber and it is not there?—It may occur.

26988. (*Mr. Smillie.*) Did you not say that it was a prolific cause of accidents?—I put it forward as a cause of accidents, but I do not think as a prolific cause of accidents. Accidents will arise, and that possibly may become one of the causes.

26989. (*Mr. Enoch Edwards.*) I understood you to suggest that if the man failed to pay his tip, the haulier took care he did not get his tubs or timber as regularly as the man who paid tips. If his timber is not taken to him but to the other man who gives him a tip, it will follow that this man at times wants timber and it is not there?—Yes. I quoted a case in Monmouthshire where the examiner found a man had not a post, and he asked the haulier why, and the haulier said he did not pay his rent last week. Although you could not apply it to every case, yet there is preference given to the man who pays the tip.

26990. In answer to one of the Commissioners you said that was in some cases with the knowledge of the managers?—I can hardly understand the manager of a colliery not knowing the existence of the system.

26991. I think you put it that way, that it was with the knowledge of the manager?—Of necessity.

26992. If it was done there it must have been known. You refer to the Home Office examinations for managers' certificates?—Yes.

26993. For convenience they are fixed in certain centres, more for the convenience of the locality than anything else?—Yes, and to meet the local needs that those who are anxious to become managers in South Wales should sit at the examination at Cardiff or in South Wales.

26994. You do not suggest that a man who has secured a first-class certificate at any of those centres would be incompetent to manage a colliery in South Wales?—No; but I suggest that he should pass the examination intended for his own district.

26995. We were told last week that an English manager had gone to one of your collieries in Monmouthshire, and the first thing he did was to change the shift from 12 hours to eight. That has not been a bad thing for Wales?—I do not know that. That was not Monmouthshire; it was Glamorganshire.

26996. That was not altogether a bad thing for Wales?—I do not know whether the manager changed the shift time or the agent.

26997. They put it since they got this manager there. I am only putting their own case. You rather suggested that a man failing to pass at Cardiff or Swansea went to Manchester because the examination was less stiff than at those places?—I know that he passed in Manchester, having failed at Cardiff.

26998. Supposing he could have had another examination at Cardiff at the same time as he went to Manchester,

Digitized by Google

do you think that he would have passed at Cardiff ?—I should not like to say that.

26999. May it not be possible in some one subject that the man was very weak, and by some means he gets to know that is the cause of his failure ?—That is what we want.

27000. In two or three months there is another examination, and if he had an opportunity of going to Cardiff, having improved himself, he might pass there ?—We have some of the published questions, and we see from the standard of requirements that possibly the second in some districts is as hard as the first in others.

27001. You suggest that the mining engineers should not receive premiums from pupils ?—Not that, quite. I suggest that a mining engineer who receives a premium from a pupil should not be the examiner of that pupil.

27002. There are three examiners ?—Yes.

27003. If there were one of them who received a premium from a pupil, what effect do you think that would have upon the other two ?—I would not like to say, because I do not know who the other two would be; but I would make it impossible for the man to be an examiner, to begin with.

27004. Does this happen in Wales ?—That one of the examiners receives premiums from pupils ?

27005. Yes ?—Yes, and I believe that it happens elsewhere.

27006. You think it does ?—I think it does.

27007. You have no proof that it does elsewhere ?—I would not like to speak except for my own district.

27008. Most of us are mixed up with these Boards. Mr. Smillie is on the Board in Scotland, and I am on the Board in Staffordshire, and I do not remember this question being before us. You made reference to a meeting that was held where all the discussion was carried on in Welsh, and the Assistant Inspector understood the Welsh and the Chief Inspector did not ?—Yes.

27009. Did they carry it all on in Welsh because the Chief Inspector did not understand it?—No; for the same reason that I have to lecture in Welsh occasionally.

27010. I have been mixed up with Welsh people a good bit, but I always understand that there is no Welsh talked. —You have not been to Gwaen-cae-Gurwen, Ystalyfera, Ystradgynlais or Cwmtwrch.

27011. It is hardly a case of Welsh for the Welsh ?—No. I believe in Wales for the best.

27012. Am I correct when I say all the demonstrations so far as the Miners' Federation is concerned are conducted in English ?—The best test is this: a member of the Cardiff University College staff, who had to collect subscriptions for the building of our new Mining School, was very greatly annoyed and vexed because he could not make the people understand what he wanted when he begged them to subscribe.

27013. I quite believe that ?—If you want to convert a Welshman you must speak to him in Welsh

27014-5. It is awkward if you are collecting subscriptions ? He may not understand English in that case. I do not understand Welsh, but I address meetings in Wales ?—You only go to the biggest places; the smaller men go to the smaller ones. You have not been to Cwmtwrch or Ystradgynlais or Gwaen-cae-Gurwen.

27016. Some of these people who address your people do not know Welsh themselves? Some of them do not, but in this particular case the men speak Welsh. They speak about "Bwrnel." The inspector would not know what it was, and it came up repeatedly.

27017. I was at an inquest, and the witness insisted on giving evidence in Welsh, but I was thoroughly satisfied that he knew English, and could talk English, because I had a chat with him afterwards; but perhaps having the Welsh interpreted to him gave him more time to feel his feet ?—Perhaps he was anxious to make you comfortable, and show his respect for you.

27018. I was not cross-examining him ?—This Conference was carried on in Welsh because the men more frequently use the language at Gwaen-cae-Gurwen. Ystalyfera, Ystradgynlais and Cwmtwrch. I have to address the men in Welsh sometimes, because they understand me better in that language.

27019. You are quite at home with it ?—No, I prefer English; it is difficult to talk about carburetted hydrogen in Welsh.

27020. (*Mr. Wm. Abraham.*) If you address a meeting in the Rhondda are there not thousands who would understand you better in Welsh than in English ?—Yes, in Treherbert, and other places.

27021. (*Mr. Smillie.*) I understood you to say that the Conference at which the chief inspector did not understand the Welsh was really a conference of miners' delegates ?—Yes, miners' representatives. There were, I think, five of them present.

27022. Were there any who did not understand English ? —They understood English, but they were more conversant with the Welsh. They spoke Welsh in the mine, and at home, and they went to Welsh chapels, and when they wanted to discuss such things as the preparation of squibs and shot-firing, they were more at home in Welsh, and made a special appeal to have the conference conducted in that language.

27023. It was the local officials and not the general officials ?—The Western Division, the anthracite district, the Swansea Valley.

27024. What further examination do you propose that a candidate for a mine manager's certificate who might pass in Manchester should undergo before he became a manager in Wales ? Would it be a *viva voce* examination ?—I would have one general examination.

27025. For the whole country ?—Yes, and one examination suitable to local needs.

27026. What kind of an examination would you have ? —A *viva voce*, or an examination on paper of the methods of working—the methods of working adopted only in the particular district, or peculiar to that district.

27027. Would your suggestion with regard to inspectors, that an inspector having a knowledge of the Welsh language should be preferred, also refer to a colliery manager ?—Yes, because when a Welsh colliery manager gets angry he invariably speaks in Welsh.

27028. There are localisms in every district, practically ? —Yes.

27029. In Scotland we use terms which are absolutely different from what they are in the North of England, or the Midlands, or in Wales. A colliery manager, who might be a good colliery manager in Wales, it may be suggested, would not be employed in Scotland until he had gone through an examination on those local terms. Would you go that length ?—No. A man may be successful in the North of England, and be transferred to South Wales and be successful; or he may be a successful manager in Scotland, and be transferred to the South of Wales and be a successful manager for many reasons. I would not consider it necessary to examine that man, but at the start, when the man sits for the examination qualifying him to become a manager in South Wales, I think he should know the Special Rules and all subjects relating to that district.

27030. There have been a number of very successful Englishmen and Scotsmen who went to South Wales ?—Yes, and a number of successful Welshmen who have gone north.

27031. Who have been successful when they have gone north ?—Yes.

27032. We have a mines inspector there who can speak Welsh ?—Yes, they speak English and Welsh.

27033. At least, so Mr. Abraham tells me—I do not know myself. I am particularly interested in the question of instruction of children in the mining districts. I understood you to say that the children under 14 still attending school were taken to the mines and down the mines ?—They are taken to the mines as school children and taken down the mines immediately they become members of the evening continuation school.

27034. They may be employed underground at that age, so far as age is concerned ?—Yes.

27035. You do not take them underground ?—Direct from the school ?

27036. So long as attending day school under 14 years of age ?—No, we take them to the colliery and to the lamp-room and so on. From the evening continuation school, where we have an expert as teacher, we take them underground.

27037. It is a very great concern to me that children should get some knowledge, even during their elementary training, of mining, and the nature of gases and other things. Is there any general instruction given in the schools in Wales in that direction ? Is it a part of the curriculum of the school or provided for in the time-table ? Is time set apart for giving the lads any instruction in those matters ?—In Glamorganshire we make it part and

Digitized by Google

Mr. Henry Davies.

10 July, 1907

parcel of the syllabus in the 5th or 6th Standard, I mean that standard before the boys go to work. We go a step further and have made a promise to all the teachers qualified to give such instruction, that in cases of promotion they shall receive preference.

27038. You have no Government grant for that?—Yes, it comes in under what we call general object lessons. They are permitted to give a certain number of general object lessons in the year, and we hold that six should bear on mining matters. We recommend that lessons on the following subjects should be given:—"(*a*) Coal, and how it is formed. (*b*) Coalmine gases and how they become dangerous. (*c*) The safety lamp and how to use it. (*d*) How a colliery is ventilated. (*e*) How the coal is worked in the mine. (*f*) Rules framed for the miner's safety." That is referred to in the Report of the tours of mining students under the Glamorgan County Council.

27039. Do you think these lessons once a year would be of very much advantage? Do you think that educational authorities should insist on that being a part of the training of miners' children and that there should be at least two lessons a week? Do you think that would be a wise course?—No, you would get the teachers up in arms. You have to move very delicately to prevent obstruction on the part of the teachers. If they give six lessons in the year in this direction and give a boy a certificate, not on examination, but if he intelligently reproduces the substance of the lessons given. When he goes to look for work if he has this certificate and is able to say, "I know about the safety lamp. I know about the Special Rules as used underground," I think it would be an advantage.

27040. Where the Government makes up its mind in the interests of a large industrial body in this country to do anything, do you think that we should pay any attention to whether the teachers get up in arms or not. Is it a good thing to teach the children something about the employment they are going to in the interests of safety?—I hold it is more important that a boy should learn something about the safety lamp than the length of the Thames or the depth of the Mississippi.

27041. (*Dr. Haldane.*) Is it practicable? I do not think there is any doubt about it being desirable?—It is practicable as far as those six lessons are concerned, but if you made it compulsory twice a week, it would have to take the place of some other subject. Now it can be woven in as part of science and the teachers are delighted with it; but if you thrust it upon them and said, "This is part and parcel of the school curriculum," they would say, "What subject are we to drop?"

27042. (*Mr. Smillie.*) It does not work out in that way, because in the board schools under our School Board, of which I was a member for 18 years, we introduced it, and there was one hour's teaching every Friday on mines and gas in mines and their nature, and the teachers were delighted, and the mines inspector examined 120 boys once a year—from 120 to 150—and prizes were given. It was the principle I was referring to, because I think sufficient attention has not been paid to the subject up to the present time?—I agree.

27043. With regard to the cap on the lamp, from your experience in Wales amongst mines' managers, do the managers consider a cap shown on an ordinary safety or examiner's lamp dangerous?—Yes. I think, generally, it is recognised that immediately a cap is seen the men should go out.

27044. Has that been the general expression of opinion amongst Welsh mine managers?—That I would not like to say; but last week a man was found by an official working in a place where a blue cap presented itself and was ordered out; he was blamed for not having gone out earlier, since there were signs of firedamp present.

27045. Supposing you got a cap a quarter of an inch long, would it be considered dangerous?—I believe any sign of cap at all on an ordinary safety lamp shows danger.

27046. (*Dr. Haldane.*) Have you ever gone round testing the air yourself at the end of a split?—Yes.

27047. In any of the Rhondda Valley collieries did you ever find a colliery where there was not a blue cap on the flame at the end of the split?—I would not say that I did, but that does not remove the point I am aiming at, that the air should be measured there and the blue cap recorded. I believe the fact that they are bound to record that blue cap will make it seldom found in the future. If better attention were paid, I believe the cap would not be seen so often.

27048. (*Mr. Smillie.*) You said "Yes" in answer to my question, "Did the managers of mines in South Wales believe generally that a cap was dangerous?"—I know men are sent out if a blue cap does appear.

27049. Are you aware that an explosion took place at MacLaren Colliery at Abertysswg?—Yes.

27050. And that the mines inspector gave evidence that he had called twice and tested the air, and called the attention of the mine manager to a dangerous cap for 500 yards in the aircourse?—Yes.

27051. Are you aware that three managers gave evidence at the inquest and all stated that a cap in the lamp was not at all dangerous, and that they would not withdraw the men?—That was at the inquest.

27052. If three skilled men who are at present managers in Wales give an opinion that they would not withdraw the men where a cap was shown on the lamp, do you still hold that colliery managers in South Wales think a cap is dangerous?—The men are sent out when a cap does appear.

27053. Those three colliery managers said they would not?—It was a question of opinion as to what really constituted a danger.

27054. The Government has that Report in which it is stated that those managers would not withdraw the men where the cap was shown?—Yes.

27055. Even when the mines inspector instructed them that there was danger?—As a result of that enquiry it is assumed, wherever a cap presents itself, that it is a proof of inadequate ventilation. The whole question came about as the result of that enquiry, and to-day it is acknowledged that a blue cap is a sign of inadequate ventilation. Before that it was not recognised as such.

Mr. THOMAS HUGHES, called and examined.

Mr. Thomas Hughes.

27056. (*Chairman.*) You are a collier in North Wales?—Yes.

27059. Where at?—At Bersham Colliery.

27060-3. Do you wish to say something to the Commission about propping?—Yes, and a little bit more.

27064. (*Mr. Ratcliffe Ellis.*) Will you say what you want to say?—In the first place we thoroughly believe that the time has arrived—and it ought to have been before—that we ought to have had a chief inspector residing in Wales, and that he should be a Welshman.

27065. (*Mr. Smillie.*) In North Wales?—Yes.

27066. (*Mr. Ratcliffe Ellis.*) Your present inspector is Mr. Hall?—Yes.

27067. Mr. Matthew, the assistant inspector, is a Welshman?—Yes; but Mr. Hall is the responsible person, and he lives in another county.

27068. You think that you ought to have a chief inspector for North Wales, who ought to be a Welshman?—Yes, residing in North Wales.

27069. That he should be a Welshman and speak Welsh?—Yes.

27070. What is your next suggestion?—In drawing up the Special Rules we think that we ought to have the privilege of co-operating with the employers in drawing out Special Rules, because it affects both parties and is something similar.

27071. What is your next point?—With regard to propping. We believe that in every seam that is over 4 feet all straps should be set, and not single props.

27072. What do you say should be done?—Set the straps instead of single props acting—small bars.

27073. Two props underneath, and a bar at the top?—Yes.

Digitized by Google

27074. So that the roof should not be dependent on the prop but a bar, and these props to support the bar ?—Yes.

27075. Do you think that should be done ?—Yes, in every seam of coal that is over 4 feet.

27076. What is the next point ?—Spragging is general through our district, but they do not send or make sprags for us. We have to make our own.

27077. That is a question rather of the management ?—Yes.

27078. You have to sprag according to the Act of Parliament ?—We have to make them as well.

27079. Do you object to making them ?—Yes, unless we are paid for them.

27080. That is a question of wages rather than a question of safety. The sprags have to be put in ; but your objection is that you have to make them ?—It bears very much on safety.

27081. You say that the employers ought to supply them to you, or pay you for making them ?—Yes.

27082. What is the next point ?—The next is the packing. The packs are not properly made up, because they are not paid for.

27083. You are required to do packing, which you are not paid for ?—That is the reason that the roads are so bad in 150 yards along the face, where the whole of the accidents happen in the mine.

27084. Is it part of your arrangement now that you have to do packing ?—No.

27085. Do you do the packing ?—Yes.

27086. Why do you do it ?—It is a part of our contract to put all our dirt that is coming from the coal on top or underneath, and not to do any more.

27087. Are you required to do more than that ?—It will be safer for the men and the boys if there were proper packing.

27088. It would be safer if the packing was not left to the collier : but either the collier was paid for doing something more than he does, or somebody else did it ?—Yes. I think that there should be proper packing, and if there was it would be safer for the boys.

27089. It is not properly packed ?—No. He is not paid for it.

27090. Your complaint is that at present it is not properly packed ?—Yes.

27091. If some addition was made to the collier's wages he would pack it properly ?—Yes.

27092. What is the next point ?—In regard to haulage, we feel that a great many accidents happen in our district through the roof, being too low for the trammers. We have many trammers in our district, and there are no handles or anything to defend their hands, and that the coal catches them.

27093. On the wagons ?—Yes.

27094. You think there ought to be a guard ?—I think there ought to be some handle with them so that they can take their hand off the top.

27095. To protect the hand where the roof is low ?—Yes.

27096. What is the next thing ?—There is nothing else.

27097. Is that all ?—Yes.

27098. (*Mr. Enoch Edwards.*) Your district has about 10,000 men ?—Yes, between 10,000 and 12,000, top and bottom.

27099. You are in what they call the Liverpool district of inspection ?—Yes.

27100. Does the assistant reside in Wales ?—No, he resides in Cheshire.

27101. You think there is sufficient work for a responsible inspector in North Wales alone ?—Yes.

27102. There are 10,000 men there, and it has always formed part of the Liverpool district. I suppose they undertake the quarries there, too ?

(*Mr. Ratcliffe Ellis.*) Yes.

27103. (*Mr. Enoch Edwards.*) Your point is that it should be made a district of itself for a chief inspector who can speak Welsh ?—Yes.

27104. What do you mean by about 4 feet thick ? Have you had much experience of mines outside North Wales ?—Yes.

27105. You suggest, where the coal is 4 feet thick, that all the timber should be up to the face ?—Over 4 feet thick.

27106. First of all, do you work longwall ?—Yes.

27107. Is the roof of such a nature that it is necessary to carry props and bars along the face ?—Yes.

27108. Are you aware in many seams in the country that is not necessary at all ? It is not necessary to timber clean up to the face ?—Yes.

27109. You suggest here that it should be made compulsory ?—We are compelled under our rules to do it, whether we want to or not.

27110. There is considerable labour in setting timber bars and legs ?—Yes. In all the seams over 4 ft. we are taking the tubs along the face in longwall work. This systematic timbering causes a lot of trouble, and is not so safe.

27111. Your point is that bars should be made compulsory. That involves a contract ?—Yes.

27112. Your contract will include the setting of these timbers—I mean your present contract ?—No.

27113. You are paid extra for it ?—When we set bars we are paid for it.

27114. You are not paid for props ?—No.

27115. If you are putting bars on top of props you will be paid for it ?—Yes.

27116. For props alone you are not paid ?—No.

27117. Do you think it much safer to set bars ?—Yes.

27118. That is not the general experience in the country. From your experience, as applied to your seam, that should be so ?—Where you are working the seam at 5 ft. you cannot see the slips. It is not so visible.

27119. Except in practice they do not do it. You have been at it a great many years ?—Yes.

27120. There have been Special Rules drafted several times ?—Yes.

27121. Have they ever asked your Union about it or your officials ?—No.

27122. They have never consulted you at all ?—No, only they set a notice up, if any individual has an objection.

27123. They never meet you in conference to discuss them ?—No.

27124. That is rather the fault of the inspector ?—We met on the General Rules once or twice in my experience.

27125. The inspector would be the person responsible for getting a joint meeting of you and the employers. You think in any Special Rules that are drawn up the men should be consulted with the owners ?—Yes, and take part in it before they are signed.

27126. Mr. Ellis raises no objection to that as far as I can see. With regard to the question of lids to timber, you have to make your own in the pit ?—Yes.

27127. It would be easier to make them on the top ?—Yes.

27128. You would have better tools there to make them with ?—Yes, and more time to set them. When he has to make them and set them it takes his earnings away.

27129. It is a question of whether they have the proper appliances to make them or leave you to make them. You think they could be made better at the top. You ask while they have to send in timber under the rules that they should also send in lids properly shaped ?—Yes.

27130. I gather that you do not pack your working face along ?—I consider on the side it should be packed to make the road safe, that is 50 yards from the face. That is where the accidents happen from falls from side and top.

27131. Largely, where you work longwall by contract, they have an inclusive price which includes ripping the top and packing. The workmen are responsible for the packing ?—They are only responsible as far as the dirt on the face. There might be some under the coal or in the coal. They are not responsible to go back into the waste to pack.

27132. You are referring to your custom in Wales ?—Yes.

27133. As they clean the coal they are supposed to pack the waste in longwall work ?—Yes.

27134. The nearer you can bring it up to the face the better ?—Yes.

27135. Have you much difficulty with these low roads ? You say that the roads are very low. Do they ever rip the roads at all to make them a proper height ?—Yes.

Digitized by Google

Mr. Thomas Hughes.

10 July, 1907

27136. In time they get low ?—Yes.

27137. The lads and hauliers with their hands on the top get trapped ?—Yes.

27138. Do you have many boys with their fingers cut ?—Yes.

27139. You think that should be obviated by handles just below the top ?—Yes.

27140. What do you actually do with regard to the packing. You say the packing is not properly done ?—Yes.

27141. Will you tell us how it is done ?—It is not properly packed up to the roof, the dirt is not thrown into the walls. They make the walls here and do not give half a yard from the top. That is giving the road the chance of weighing in.

27142. Who is to blame for not doing that. On whom do you put the blame for that, is it the collier ? Does he not do what he ought to do, or does not the management do it ?—I cannot say.

27143. I understood from you that the price you are paid includes throwing the dirt back into the wall and filling up, but not a tight packing ?—Yes, it is in the coal on top or under the coal ; we put that in the pack. When that is not sufficient, and that is the general rule, the pack is left half made. We advocate that the mine ought to be properly packed for the safety of the men.

27144. (*Mr. Smillie.*) There is not sufficient stuff now to pack it ?—No, we think it should be properly packed, whether he should do it for nothing or be paid for it.

27145. (*Mr. F. L. Davis.*) Your point is that there is not enough dirt and stuff for you to properly pack ?—Not as a rule.

27146. They do not send any in to you ?—Yes, at nights.

27147. But it is not sufficient ?—No.

27148. (*Mr. Wm. Abraham.*) There is no more payment in your contract for packing than simply throwing the dirt in working the coal into the gob ?—That is all.

27149. Your complaint is that there is not sufficient care being taken to fill the place up ?—Our opinion is, if places were properly packed that the roads would be much safer for the lads ?

27150. And there would be no room for gas to lurk in either ?—I do not know about that. As a rule we are keeping six, or seven, or eight yards on the waste. If you move gas from here it will be there.

27151. Have you any gas there ?—Yes, occasionally.

27152. A road well packed would be a safeguard against an accumulation of gas ?—Yes.

27153. As well as extra safety for the top ?—Yes.

27154. Your complaint is that the packing is not being done sufficiently well to give you that protection from a fall of roof or from an accumulation of gas ?—Yes, also that the coals would be better, too.

27155. That is a question of management. It is a question of safety that we are here upon. What point from the working face do you get your timber ?—As a rule they come in. In a great number of instances we have them from the next shunt to the face or flat, as we call it in North Wales, or pass-bye. The roads are too low to put the props on the top of the tubs, and we have to go to the pass-bye for them.

27156. Have you to carry sprags ?—We are making the sprags from our timber. If we have old ones we cut new ones to make the sprags.

27157. I do not understand what you mean ?—We are making the sprags out of old props, and if we have not old props we have to make sprags out of new ones.

27158. Have you to carry that timber to make the sprags from the pass-bye ?—Yes, in many instances, but where they can come in they send them in.

27159. Is it a question of payment for putting up, or is it a question of the necessity of flats, or is it a question as regards safety ?—It is a question of safety, and safety alone.

27160. You think, in order to give you the required safety, that you could have flats put up and not props ?—Yes.

27161. (*Mr. Smillie.*) Let us get at the question of the flats. You say in the workings at 4 ft. high you take your tub along the face right up the longwall ?—Yes.

27162. That will leave a space between your props and the coal face of, perhaps, 3 ft. ?—No, it will leave 1 ft. to half a yard.

27163. Can you take up a tub in one flat ?—No, here are the two props, and the bars will be 6 ft. (*indicating*).

27164. That is your present position without the bars. If you take your tub along the coal face just now and you are only setting props there will be a space between the props and the coal face ?—Yes.

27165. You propose that the bars should be over the top of the tub, so that a stone cannot fall down as it can now ?—Yes.

27166. Where the roof is bad it might be necessary to put the end of the bar over the coal and a prop in at the other end ?—We generally have that privilege by a manager or a fireman. You must have a bar here or else it would be dangerous. He would not allow us to put the bars systematically in about 3 ft. to one another along the wall because he has to pay for it, but our experience is that it would be much safer, and we are arguing for safety.

27167. What is your present systematic timbering ?—5 ft. from each other.

27168. That is the distance the props are ?—Yes.

27169. The men are of opinion if it were made compulsory to have bars over 3 or 4 ft. that that would tend to greater safety ?—Yes.

27170. Because sometimes a stone falls out from a slip without giving warning ?—Yes.

27171. In the space between the props and the coal face ?—Yes.

27172. Of course it would be only a question of arrangement for payment for putting up those bars if it were made compulsory to have the bars ?—Yes.

27173. Why in seams over 4 ft. ? You might have just as bad a roof in 3 ft. as in 4 ft. ?—Yes.

27174. Why do you propose in over 4 ft. ?—It would be impossible to set a bar in 4 ft., and take the tub there, because it would be too low.

27175. You do not take the tubs up the face ?—Yes.

27176. Not in the 3 ft. ?—In 4 ft. and 3 ft. 6.

27177. You might have some 2½ ft. Why not have the bars there ? You do not take the tubs up the face ?—It would be too low for the bars.

27178. It has to be done now in many cases. Where the roof is bad bars have to be put in over the top of the coal head and one end of the bar put in there and the other end of the prop put to it. That has to be done in thin seams. You would not object to that being done in any place where the roof is bad ?—No, but I am speaking now for my own district alone.

27179. Are all the seams in your district over 4 ft. ? —Only a few seams ; as a rule they are 5 and 6 and 7 ft.

27180. They are nearly all over 4 ft. ?—Yes.

27181. Are your main roads at the present time sufficiently high ?—No.

27182. Do you rip them ?—Yes.

27183. Does the miner do his own ripping ?—Yes.

27184. The man who has charge of the place ?—Yes.

27185. That is a separate price ?—That is a contract.

27186. Is he not expected to pack his place with what comes out of the ripping ?—Yes.

27187. Is there not sufficient with the ripping to pack the place ?—Yes.

27188. Do you suggest that rubbish should be sent in, or that the places should be packed partly with timber ? —Our argument is that the mine ought to be better packed, because we think that it would be safer for the boys and the men.

27189. In order to prevent the roof coming down. You think it would not, if properly packed, come down as far as it does just now ?—Yes.

27190. You do not care what the method is as long as it is properly packed ?—We have the method, but it is not carried out.

THIRTY-NINTH DAY.

Tuesday, 16th July, 1907.

PRESENT:

Lord MONKSWELL (*Chairman*).

WM. ABRAHAM, Esq., M.P. (Rhondda).
F. L. DAVIS, Esq.
THOMAS RATCLIFFE ELLIS, Esq.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. WILLIAM GRIFFITHS, called and examined.

Mr. W. Griffiths.

16 July, 1907

STATEMENT OF WITNESS.

27191. (1) *Lamps.*—I believe that if the double gauze lamps could be so constructed as to give proper and sufficient light in the ordinary air currents underground, and with the heat of the underground workings, they should be generally adopted in preference to single gauze lamps.

(2) *Accidents.*—I believe that the present regulations as to shot firing, if strictly adhered to, are sufficient; but as an additional precaution I would suggest that all holes should be charged by a competent official appointed by the colliery company. Accidents arising from falls could be minimised by a more regular attendance of men at their work. I also think that there should be a system in operation in the coal field, whereby every company could ascertain whether every workman, upon being given employment, was competent in whatever department of mining he had been engaged in.

(3) *Rescue Facilities.*—No fixed special provision can be adopted for all collieries, as rarely are the conditions and results of any two accidents alike.

(4) *Accident Enquiries.*—I can suggest no improvement on the present method of investigation into cases of accident.

(5) *Ventilation.*—No definite standard of ventilation can be laid down as being applicable to all collieries, as the ventilation must differ with the varying nature of the seams, also with the depths of the seams, while it is known that one system of ventilation is not applicable to two districts in the same seam.

(6) *Special Rules, etc.*—I consider the present system of Special Rules adequate, but if they were drafted in a more condensed form, it would be of assistance to both workmen and officials. Every workman should be made to learn the chief provisions of the Coal Mines Regulation Act before being employed; I also think that the Act or a part of it, should be included among the subjects set in the labour examinations in our schools, thus making certain that when boys start work underground, they have a special knowledge of the dangers attending their occupations.

27192. (*Chairman.*) You are a night overman in the employ of the Cambrian Collieries, Clydach Vale, and have worked underground for 40 years, 19 as a workman and 21 years in different official positions. Have you ever been outside the Cambrian Collieries?—Yes, I have been at Mountain Ash in Powell-Duffryn Colliery, Nixon's, and at Wattstown in Ferndale.

27193. You have had a good deal of experience in South Wales collieries, but not elsewhere?—Yes.

27194. What were the different official positions you occupied?—From fireman up to overman.

27195. You began as fireman and became an overman?—Yes.

27196. How long have you been an overman?—I have been about 16 years.

27197. When you began your experience as a fireman did you consider that the district that you served was more than you could properly manage?—No, not at the time.

27198. You never complained, as a fireman, of having too large a district?—No.

27199. You were able to do all the duties of fireman in your district without being overworked?—Yes.

27200. With regard to your position as an overman, do you consider that you have more work than you can do properly?—No.

27201. What is your duty as an overman?—To examine the workings and see that everything is carried on in working order and in safety.

27202. You are not like a fireman, chiefly concerned with the safety of the miners; you have, as overman, to carry into effect the instructions of the manager or undermanager, and to see to the working of the mine?—Yes.

27203. I see among other duties: "He shall direct that timbers are set in the best manner in all places where they are required, and shall take care these instructions are obeyed." Do you find any difficulty in carrying those instructions into effect? Do you find that the men are desirous of setting their own timber and do not like to be interfered with?—No, I cannot complain of the men.

27204. They are quite ready to fall in with your directions with regard to setting timber?—Yes; I have always found them so.

27205. Do your duties overlap the duties of firemen at all? Do you and the firemen have, to some extent, the same duties to perform?—I have to go through every working place: the fireman goes through once a day,

27206. I mean an examiner when I say a fireman?—Yes.

27207. I see one of your duties is to examine every working place once during the shift?—Yes.

27208. Before the shift the working places are examined by the examiner?—By the fireman.

27209. Notwithstanding that examination before the shift, you have to go round during the shift and examine every working place?—Yes.

27210. You have something to tell us about lamps. You consider that double gauze lamps are safer than single gauze lamps?—Yes.

27211. And should be generally adopted in preference. Of course, the difficulty arises in this way: double gauze lamps do not give nearly as much light as the single gauze lamps?—They are confined too much.

27212. Supposing you had a lamp that gives a better light, if you cover it with double gauze it would certainly give less light than a single gauze lamp?—Yes.

27213. So that you have to balance one consideration against another?—Yes.

27214. You are decidedly of opinion that where it is practicable that a double gauze lamp should be used if sufficient light can be got out of it?—Yes.

Digitized by Google

Mr. W. Griffiths.

16 July, 1907

27215. Have you anything to go upon when you say that? Have you any statistics as to accidents that you believe have been caused by lamps only having a single gauze?—No.

27216. What is the proportion of double and single gauze lamps employed in the collieries you have worked in?—Where do you mean?

27217. Do you think that more single gauze lamps or double gauze lamps are used in the mines you know?—More single gauze lamps.

27218. Have you anything to say as to accidents which have happened in cases where double gauze lamps have been used, and cases where single gauze lamps have been used? Do you think more accidents have happened where single gauze lamps are used?—My opinion of the double gauze lamp is that it will go out quicker in gas. It is not possible for that lamp to explode.

27219. Have you known instances of an explosion in the case of single gauze lamps where if double gauze lamps had been employed there would have been no explosion?—We would save a good many of them, I daresay.

27220. You would save many an explosion?—Yes.

27221. Then with regard to shot-firing, you suggest as an additional precaution that all holes should be charged by a competent official appointed by the colliery company. What is the usual practice in your mines?—We charge our own holes.

27222. Every collier?—Every official. We keep an official at our colliery.

27223. The officials do charge the holes in your colliery?—Yes.

27224. You know that in other places they do not?—Yes.

27225. You want that rule to be made obligatory?—Yes.

27226. That is the practice that obtains in your colliery?—Yes.

27227. You say that accidents arising from falls could be minimised by a more regular attendance of men at their work. What do you attribute that irregular attendance to? Is it to a desire on the part of the men not to do more than a certain number of days' work in the week, or to any action of the managers in restricting the output?—We want regular working.

27228. You consider it is a great pity that the men should not work regularly?—Yes.

27229. Whenever they can do so?—Yes.

27230. You go on to say that there should be a system in operation in the coalfield whereby every company could ascertain whether every workman upon being given employment was competent in whatever department of mining he had been engaged in. That would be very desirable if it could be carried into effect. I suppose in their own interests managers would see a man was a competent miner as far as they could?—I do not know. I do not see how they could refuse a paper to a man when he was leaving the colliery to go elsewhere to work.

27231. So that you mean where a man is practically discharged for being incompetent the manager is kind-hearted enough to give him a certificate to get employment elsewhere, although not very competent?—There are a good many of our men travelling who will be assistant timbermen first. They will go to the next colliery in a few months before they have properly learned timbering, and ask for work at timbering, and say they have been timbering at the Cambrian Collieries or elsewhere. They will get a place and perhaps get killed.

27232. If a man seeks employment as a timberer in another mine, I suppose the man he goes to would demand some security that he knows about it?—That is what I want.

27233. You would like every manager or under-manager to state in the certificate that he gives to the workmen who leave his mine, exactly what their qualifications are?—Yes.

27234. Now he says he has worked so long as a timberer?—Yes.

27235. I rather understood, from reading the notes of your evidence, that when a man left the colliery to get work elsewhere you were in favour of the colliery which had employed him stating in detail what qualifications he possessed, but I understand from Mr. Abraham what you want is this, not that the man under whom he was employed should be bound to give him a detailed statement as to his competency, but that he should be examined in some way as to his competency?—Yes.

27236. A sort of public examination?—Yes.

(*Mr. Wm. Abraham.*) He says a system in operation in the coalfield.

27237. (*Chairman.*) Whereby every company could ascertain whether every workman was competent. The system you suggest is a system of public examination?—Yes.

27238. As to rescue facilities, you say that no fixed special provision can be adopted for all collieries, as rarely are the conditions and results of any two accidents alike. I do not think it quite follows because the conditions and results of no two accidents are alike that there may not be a general system laid down for having rescue facilities in mines that might be useful in almost every kind of accident. Then you can suggest no improvement on the present method of investigation into the cause of accidents?—No.

27239. You are quite satisfied with the verdict and the evidence produced at coroner's inquests?—Yes, I am.

27240. With regard to ventilation, you say that no definite standard of ventilation can be laid down as being applicable to all collieries, as the ventilation must differ with the varying nature of seams, also with the depth of the seams, while it is known that one system of ventilation is not applicable to two districts in the same seam. I rather gather from that view of yours that you think that General Rule No. 1 is about as far as you can get?—Yes.

27241. You are satisfied with General Rule 1. Then with regard to the Special Rules, you consider the present system of Special Rules adequate. What do you mean by the present system of Special Rules? Do you mean the Special Rules themselves as they are enforced in your district, or that the system of setting them up is, in your opinion, an adequate system?—The system of setting them up.

27242. You are satisfied with the present method of setting up Special Rules, that is to say, as I understand it, that the manager, on behalf of the owner, will put forward a certain rule which the men may, if they like, take exception to, and these Special Rules are sent to the Home Office before they are established. You are satisfied that it is not necessary that the men should be consulted previous to the mine owners having committed themselves to certain Special Rules. Now the mine owner puts forward certain Special Rules, and he is committed to those rules, to a certain extent, before he consults the men at all. It has been suggested that the men might be consulted before the mine owner had come to any definite conclusion with regard to the rules. He might say to the men, "I think it desirable that certain Special Rules should be promulgated, but I should like to hear your opinion before I send them to the Home Office for approval?—I should like each man to have a Special Rule put into his hand when he is employed.

27243. I understand that you are satisfied with the present system of setting them up; the only criticism you make with regard to the Special Rules is that you think they should be printed in a more condensed form?—Yes.

27244. You think they are too long?—Yes.

27245. Too elaborate?—Too many words.

27246. You think that the gist of these rules, the kernel of them, as it were, could be put in much simpler and shorter language?—Yes.

27247. You suggest that every workman should be made to learn the chief provisions of the Coal Mines Regulation Act before being employed. You would have some examination. Would you suggest that the under-manager or somebody else should be bound to give every workman a certificate that he knew the Coal Mines Regulation Act before he was allowed to go underground?—No, I do not think I would do that; I would give him the Special Rules for him to keep and read himself and learn before he goes on.

27248. Do you suggest the management should tell the men it was very important that they should know the Coal Mines Regulation Act?—Yes.

27249. If the men do not choose after that warning to take the trouble to learn the Act, you would leave it there?—Yes.

27250. Then you think that the Act, or a part of it, should be included among the subjects set in the labour examinations in our schools. What do you mean by "the labour examinations"?—I mean that would be a great help.

Digitized by Google

27251. What do you mean by "the labour examinations"; I do not understand the phrase "the labour examinations"?—The Coal Mines Regulation Act ought to be read in school during a part of the last year that the boys are in that school. That is my meaning.

27252. You would have the Coal Mines Regulation Act as a special subject?—Yes.

27253. You would call it a special labour subject?—Yes.

27254. This special subject, namely, the provisions of the Coal Mines Regulation Act, to be taught to a boy in the last year he was at school?—Yes.

27255. Would you suggest that he should not be allowed to work underground until he had passed an examination showing that he had mastered the provisions of the Coal Mines Regulation Act?—Yes.

27256. (*Mr. Ratcliffe Ellis.*) Do you think that the irregular attendance of the men is a cause of accident?—Yes.

27257. Do you mean leaving the place for some time without anybody in it?—Yes.

27258. So that when the collier is not at work there is no person working in his place, and therefore it does not get that attention it would if the man was engaged in it. That is what you mean?—Yes.

27259. Can you suggest any way by which men could be induced to attend more regularly to their work?—Well I do not know. There is a lot of it, but of course when you are losing work from sickness, you cannot help it.

27260. That is not the usual cause of absence?—There is more loss of work without sickness.

27261. You cannot suggest that the employers can do anything?—No.

27262. It must be a movement among the men themselves to get more regular attendance?—Yes.

27263. Who sets the timber with you?—The timberman.

27264. In the working places?—Each timberman repairs his own road in the face.

27265. Who sets the timber in the working places?—The collier.

27266. Do you think he is the proper person to do that?—If he is not the proper person we put one there to assist him.

27267. The collier does the timbering in his working place?—Yes.

27268. Do you think he is the best man to do that?—Yes.

27269. He knows better than anybody else how to protect himself in his working place?—Yes, if he is a competent person.

27270. In the roads the timberman does it?—Yes, on the repairing roads.

27271. You do not find fault with that arrangement?—No.

27272. With regard to the charging of shots at your colliery, the official charges the shots?—We always keep a shotman on purpose for it.

27273. Both to charge the shots and to fire the shots?—Yes.

27274. The collier drills the holes?—Yes.

27275. That is his business; and then when the shot-lighter goes he sees that the hole is properly drilled before he puts the charge in?—Yes.

27276. That is an advantage?—Yes.

27277. You think that is a good thing?—Yes.

27278. You are speaking of shots in the coal now?—We do no shot-firing in the coal.

27279. Are you speaking of the shot-firing in the roadways?—Yes, in the roof and sides.

27280. Is it usual in other collieries for that to be done by the man who is repairing the road?—Yes.

27281. And not by the shot-firer?—No.

27282. Would you approve a regulation that no shots should be fired in the roads except under the direction of the manager?—Under the direction of the shotman.

27283. I am going above the shot-lighter, I mean the manager?—Yes.

27284. Would you approve a regulation that the manager must direct any firing in the roads?—Yes

27285. The shotman would carry it out subject to the direction of the manager?—Yes. The manager has to make a report that such a road is to be fired in before the shotman can do it now.

27286. Is that the case in your colliery?—Yes.

27287. Is that generally so?—At our colliery.

27288. (*Mr. Wm. Abraham.*) Do you say in your colliery no shot is fired in the main roads except under the direction of the manager?—Yes; he must make a report on the book before the shot fireman can fire it—that a shot is to be fired in such a place.

27289. (*Mr. Ratcliffe Ellis.*) Have you ever been a shot fireman yourself?—I have fired shots when I was a fireman.

27290. Is there any regulation as to how soon after a shot has been fired they may go into the place where it has been fired?—No, the shotman goes back to see the hole is all right, and then the men can go in at once.

27291. The men working on the roads?—Yes, but we are firing between shifts.

27292. Do you fire more than one shot at a time?—No.

27293. What interval of time do you allow between the firing of one shot and another?—Five or ten minutes if close to one another.

27294. Do you think that is enough time to allow?—Yes.

27295. (*Chairman.*) You represent the South Wales Colliery Officials' Association?—Yes.

27296. Numbering about 230 men?—Yes.

27297. Do I understand that you placed before this Association the notes of what you are going to say here? Do they know what you are going to say here?—They know part of it.

27298. You know sufficient of their views to be able to assure the Commission that what you state is in the main the views of your Association?—Yes.

27299. I was rather astonished to hear you tell Mr. Ellis that you thought the collier the best man to set up the timbers, because the Special Rules say that you yourself (I have already directed your attention to it) shall direct that the timbers are set in the best manner in all places where they are required, and shall take care these directions are obeyed?—Yes, by my direction they are putting the timber up.

27300. You are the person to direct the collier?—Yes.

27301. You know more about the timber than the ordinary hewer?—Of course.

(*Mr. Wm. Abraham.*) He believes that the hewer himself should be so practical in every case that he would be able to put up the timber properly, but because they are not he has to direct them.

27302. (*Chairman.*) You mean the hewer ought to be better instructed in the art of putting up timber than he is at present?—Yes.

27303. At present he is not so well instructed as he ought to be; you have to give him directions, and you think that a wrong system?—I do not think that is a wrong system. I quite agree that I should give instructions to the men to put up the timber if they are putting it wrongly. I tell them that they must alter it.

27304. What you object to in the present state of things is that the ordinary hewer does not know enough about setting timber, and ought to know more?—Yes.

27305. (*Mr. Wm. Abraham.*) As a rule, the Welsh collier is a good timberer?—Yes.

27306. But there are cases in which unskilled men are engaged, and you cannot trust them to put up timber because they do not know the way to do it?—Yes.

27307. Your desire is that everyone engaged as a coal hewer should be competent?—Yes.

27308. That is why you ask that he should have some certificate to prove that competency?—Yes.

27309-12. You have no objection to the fireman or overman having the responsibility of directing everybody, competent as well as incompetent, where they find it necessary?—Oh dear no. I quite agree that the overman and fireman should direct the timbering, to teach those men.

27313. You said in your opinion that you had not too much to do?—No.

Digitized by Google

Mr. W. Griffiths.

16 July, 1907

27314. You are quite able to do all the duties set out to you?—Yes.

27315. How many hours do you work in the day?—We work from 7 o'clock till 4.30.

27316. When are you found at the colliery in the morning?—I am there to see the men starting to go down at 6 o'clock.

27317. You are there at 7 o'clock?—Yes.

27318. That is not 6 o'clock. You are there throughout the hours of working?—Yes.

27319. When do you finish?—4.30 to 5.

27320. Do all the men come up before you leave?—Sometimes I am up with the first one; at other times I am down with the men.

27321. When do you leave the surface of the colliery?—You can say you leave at from 5 to 5.30.

27322. As a rule you are there at 6 o'clock in the morning and as a rule you are there till 5.30 in the evening?—Yes.

(*Chairman.*) Have you any time for dinner?

27323. (*Mr. Wm. Abraham.*) He has no time for that. With regard to eating food, you do that when you can?—Yes.

27324. There is no specific time for that?—No.

27325. You carry it with you and put it in your room?—Yes.

27326. We want to know exactly what the state of things is. Do not exaggerate it in any way?—No, I will tell you exactly as it is.

27327. You are now the night overman?—Yes.

27328. You have the same duties allotted to you as a night overman as if you were a day overman?—Yes.

27329. In the absence of the under-manager would you have his duties to perform?—Yes.

27330. I want to call your attention to Special Rule 42: "He shall be at the colliery during the working hours of his shift, and shall not absent himself under any circumstances without first having had permission from his superior officer, and given information to the person or persons next in authority below him of his intended absence." Then Special Rule 43: "He shall, during working hours, examine the travelling roads, airways, and working places in the mine, and maintain over them and over the timbering, ventilation, and lighting of the mine, and all operations therein, a careful supervision, so as to ensure the safety of all persons in the mine." Will that be all the travelling roads and all the working places?—Yes.

27331. Throughout the mine?—Throughout the part of the mine he has to look after.

27332. Is your mine divided into districts?—Yes.

27333. Are you as overman supposed to examine all the travelling roads outside your own district?—No, everyone has his district, the same as a fireman.

27334. In the first place you shall "during working hours examine the travelling roads, airways, and working places in the mine, and maintain over them and over the timbering, ventilation, and lighting of the mine, and all operations therein, a careful supervision, so as to ensure the safety of all persons in the mine." I understood your first answer to be that you do that in all parts of the mine?—In all parts I am looking after. I have two firemen, and another has two firemen, or perhaps another will have three firemen. My duty will be to examine all the roads and airways belonging to those two firemen.

27335. Is there another overman with you?—Yes.

27336. How many overmen are there?—There are 10 in the colliery.

27337. Which of the pits are you an overman in?—No. 2.

27338. How many districts is No. 2 divided into?—It is divided into five districts, three one side of the pit and two the other.

27339. Have you five overmen in No. 2 pit?—No, there are three overmen in No. 2 pit.

27340. You have three overmen in No. 2 pit, and No. 2 pit is divided into how many districts?—It is divided into five districts.

27341. How many districts, then, are under your care?—Two, and all the roadways.

27342. (*Chairman.*) When you say "districts," do you mean firemen's districts?—Yes.

27343. Three overmen to five firemen's districts?—Yes.

27344. Is that about the ordinary proportion?—No.

27345. What would be the ordinary proportion in other parts of the mine? Would there be as many as five districts assigned to three, or more than five districts assigned to three overmen?—In our colliery there are not more than three firemen's districts, but in other collieries it is different.

27346. (*Mr. Wm. Abraham.*) You mean no more than three districts allotted to one overman?—Yes.

27347. (*Chairman.*) In your case it is only two. In one of the five districts it must be assigned to one fireman and one overman?—Yes.

27348. An overman may sometimes have three, sometimes two, and sometimes one district under his charge?—Yes, if it is not too much for him.

27349. (*Mr. Wm. Abraham*). It is according to the size?—Yes, sometimes he will do two districts better than I can do one, because they are close together, and there is no disturbance.

27350. You as an overman have the supervision of two districts?—Yes.

27351. And the roads leading thereto?—Yes.

27352. During the working hours you have to travel and examine all these roads?—Yes.

27353. And supervise the timbering, ventilation, and so forth?—Yes.

27354. Have you any system of testing the efficiency of long-standing timber?—We change it very often to see it is not going too bad.

27355. How do you find out when it becomes necessary. Is it merely a rule of thumb looking at the thing, or have you any way of testing whether this timber is right or not?—Yes.

27356. What is it?—You can do it with a knife or a mandril.

27357. But have you any system of doing it?—No.

27358. Where do you get as a rule your large falls—on your main roads?—Where the best timbering is done.

27359. Where bad timbering is done?—No, the best timbering.

27360. Do you not get falls, and some large falls, in places where timber has been standing for a long time?—Not very often; occasionally.

27361. You do get them sometimes?—Where timber has been standing for a long time the squeeze has gone from the place, and where you get large falls the gas comes in, the gas bringing on the squeeze on top, which makes a sudden crush.

27362. It is there where you know that danger lurks?—Yes.

27363. Where timber has been standing a long time there is no system of testing its efficiency?—No.

27364. What system have you of testing safety lamps?—The fireman in each district examines them every morning.

27365. Do you examine the lamps sometimes?—No, without I happen to see a lamp in the locking-place when I am there.

27366. It is no part of your duty to see that the lamps are safe?—That is done by the fireman.

27367. Where is it done?—At the locking-place at the bottom of the pit.

27368. Is there any system of examining these lamps before the men go down?—Yes.

27369. Will you explain how the testing of the lamps is done?—Each lamp is examined by a man in the course of the night in the lamp-room, who draws off the lamp gauzes and everything to test them. They are put back for the morning and lighted ready for the men to go down. The shield is not locked, so that the fireman gets his lamp and draws the shield off and sees the catches before the men go in.

27370. How does the fireman test it?—By examining the gauze and the glass.

27371. Is there anything to help him more than his eyes?—No.

27372. There is nothing to test the lamp?—No.

27373. There is nothing to test whether the lamp is fire-proof?—I have seen a gas-meter in a colliery, but not with us.

Digitized by Google

27374. Do you not think that would be an improvement to have something to test the capability of each lamp before it is given to a man ?—Yes, I quite agree with it.

27375. Does each man get the same lamp always ?—So far as it is possible.

27376. To your knowledge, has the system been that each man has got the first lamp that could be given to him ?—Yes.

27377. That is improved now ?—That is improved now.

27378. Now each man gets the same lamp as far as possible ?—Yes.

27379. Do you not think it an improvement that each man should always get his own lamp ?—To do that each man must have two lamps, because when one is out of repair he must have another.

27380. That would only be the case very seldom ?—That is how we have got it now.

27381. How ?—Each man has his lamp every day, except when it is damaged.

27382. You have arrived at that system now ?—Yes.

27383. I am glad to hear it. You as an overman have to direct that timbers are set up in the best manner in all places where they are required, and shall take great care these directions are obeyed ?—Yes.

27384. How do you do that ?—I see they do it when I am going round, and if on the second round they are not set up in the proper way, they must alter them.

27385. You have to look after the airways and travelling roads, and see that these are kept in repair ?—Yes.

27386. Also carefully observe the requirements of General Rule 7 ?—Yes.

27387. Have you any system to regulate your observation in that case ?—On the main roads ?

27388. Yes.—We always keep them in good working order, so that our journeys can travel through them. We are bound to do that, and we keep sufficient manholes.

27389. With all the work you have to do in these two districts, and it takes you 11½ hours to do it, you still think that you have not too much to do ?—Yes.

27390. You are willing to work 11½ hours ?—I could do with less time.

27391. I think you are anxious that something should be done to minimise the risk from irregular working ?—Yes.

27392. In answer to Mr. Ellis you said that the risk arises from a place being left with nobody in it ?—Yes.

27393. That place is examined before a man comes back into it ?—Yes, and reported.

27394. So that, independent of his being off for a day, or even two, you are responsible to see that that place is safe before you allow him to go there ?—Yes, by putting this collier to do what he ought to have done during the time he has been out. The place is getting dangerous because he must do it now before he goes into the face. By stopping out, the face of a stall is stopped, and the ground is always breaking, timber and everything going, until it is dangerous. He must repair it before he can start at the face.

27395. That has to be done before he commences hewing coal ?—Yes.

27396. So that the danger is removed ?—Yes, but if he goes to work it would not be there.

27397. Is it a question of the loss of coal from his absence or a question of any increased danger he has to run ?—There are both of them: the loss of the coal and the increased danger.

27398. Where does the danger come in if you have to see that the place is put safe before he commences work ?—This man ought to put it safe. The danger is in the repairing of this place.

27399. Have you known any accident to occur from this cause ?—Yes, several of them.

27400. It is because of the danger existing that you recommend something to be done ?—Yes.

27401. I think you said no definite standard of ventilation could be laid down as being applicable to all collieries. What you want is adequate ventilation ?—Yes.

27402. How do you prove the inefficiency of ventilation ?—We contend when we get too much gas that the ventilation is bad.

27403. Have you any way of finding that out before you get large bodies of gas ?—Yes; that is the work of our firemen in their examinations.

27404. You are over the firemen ?—Yes.

27405. So that you are able to speak if there is anything to be done. What is the first proof of ventilation being inadequate in a practical way ?—The first proof is when you see it begin with a cap.

27406. You are of opinion that when a cap is seen on the lamp that the ventilation is inadequate ?—Yes.

27407. Are you of opinion it is then dangerous to leave a man working there ?—Yes; we always stop him.

27408. You always send him out ?—Yes.

27409. That is the invariable rule ?—Yes.

27410. Supposing a manager or a mining engineer came here to-morrow to say that there is no danger in allowing a man to work in a place where there is a cap, would you agree with him ?—No, I would not.

27411. (*Chairman.*) How do you feed the lamps, with petroleum, or what sort of oil ?—Petroleum.

27412. Petroleum does not show a cap as easily as colza oil ?—Yes, it shows very well.

27413. You have the most sensitive lamps ?—Yes.

27414. You do not use any colza oil lamps ?—No.

27415. Are you sure that people are agreed as to what is a cap ? Dr. Haldane says he has been in working places in South Wales and seen what he has considered a cap, but he has been told by the officials of the mine that it is not a cap at all. Do you understand what you mean by a cap ?—Yes.

27416. The slightest indication of a cap is sufficient ?—You will get a cap on a lamp without any gas at all—a small cap.

27417. You can have a cap without gas ?—It is often the case.

(*Mr. Wm. Abraham.*) That indicates inadequacy of ventilation.

27418. (*Chairman.*) I understand there sometimes may be an appearance in the nature of a cap without any dangerous gas. You say there might be a cap without any gas ?—Yes, but you will find a difference between the cap of gas and the cap that is from the oil. There is a small cap from the oil. When you are getting into gas there is plenty of difference between them.

27419. (*Mr. F. L. Davis.*) It has a different appearance ?—Yes.

27420. (*Chairman.*) You find no difficulty practically, then, in telling what cap is dangerous and what cap is not dangerous ?—No.

27421. (*Mr. F. L. Davis.*) With regard to the danger that exists from men not coming into their places regularly, Mr. Abraham put it to you that before the man is allowed to work his place has been repaired ?—Yes.

27422. I understood from your remarks that the danger of repairing that place is very great ?—Yes.

27423. It has been left for one day, and to the man who has to go into and repair that place it is more dangerous than if he had been working there the day before ?—Yes, it may be left for three or four days.

27424. The danger becomes greater to the repairer of those places ?—Yes.

27425. With regard to the test of the lamps, you said that there was no actual test underground except the firemen looking at the lamps ?—Examining the lamps.

27426. Is there not a test in the lamp room before the lamp is handed to the collier ?—Not with us. The only place I saw it was Nixon's Colliery, Mountain Ash.

27427. The lamp is cleaned and examined—I mean seen to be, as far as possible, intact ?—Yes.

27428. But there is no test applied ?—No.

27429. How many men would there be in the district under your charge ?—Of colliers, do you mean ?

27430. Colliers first, and you can then tell me the others? —Some are about 250 by night with me now.

27431. How many working places would that be ?—That would mean about 45 to each fireman; there are two firemen.

27432. About 90 places ?—Yes.

27433. All the roads in that district would be under your supervision ?—Yes.

Digitized by Google

Mr. W. Griffiths.

16 July, 1907

27434-9. Your duty as overman is to examine all these places once, and all the roads, and to report to the manager anything, that it is out of place or not in working order, and everything that is not as it should be ?—Yes.

27440. With regard to timbering, you, as overman, have to tell the colliers how to do the timbering ?—Yes.

27441. As you get to the place you tell him what you think wants doing ?—Yes.

27442. You cannot be in every working place at the same time ?—No.

27443. When you are away and any squeeze takes place, or any alteration in the conditions, the collier is the best man to know how to protect himself ?—Yes.

27444. (*Mr. Wm. Abraham.*) In your opinion every collier ought to have a certificate of competency ?—That is what I want.

27445. (*Mr. F. L. Davis.*) When you tell a man to do timbering you would like to feel sure that man is competent to do it, and understands what he has to do for his own safety ?—As far as a stranger coming to start is concerned, I soon find out what sort of a man he is after a few days, but that may be too late.

27446. You said when new men are taken on you would like the manager to be able to find out if they are really competent men in the particular kind of work they have to do ?—Yes.

27447. Nothing is done at the present time ?—No.

27448. A man comes and applies for work and says : "I have been a timberman at Clydach Vale, or Mardy, or anywhere else, and the manager takes him on ?—Yes.

27449. What is the reason that the men are taken on so easily ?—Shortness of men.

27450. Shortness of labour ?—Yes.

27451. Because labour is scarce, the managers are apt to take almost any men that applies for work ?—Yes.

27452. (*Chairman.*) So that when trade is good there ought to be more accidents. When work is brisk and managers are very much in want of colliers and other men in the mines, the chances are there are more accidents ?—No doubt.

27453. There would be more men employed too, but even in proportion to the men employed you say there would probably be more accidents when trade is brisk and where the managers are inclined to take on anybody who applies ?—Yes.

27454. (*Mr. F. L. Davis.*) Is it your experience that the bulk of the men put their faces against the employment of unskilled labour ?—No.

27455. They do not ?—No. They put their faces against the colliery owners, do you mean ?

27456. The bulk of the men working in the district will be against the management taking on any number of men, some of whom may be unskilled ?—Yes.

27457. I do not know whether it comes under your experience, but I will ask you this question, because I have known it in our districts. Have you known where the management has taken on a number of men where they were short of men and those engaged in the colliery have made it so hot for them that they have had to go ?—Yes.

27458. The difficulty of the managers very often is to get labour, and when they get it they are not allowed to keep it ?—No.

27459. (*Mr. Smillie.*) Do you employ any men yourself ?—Yes.

27460. For what class of labour ?—Timbering, ripping, labourers, hauliers, roadmen.

27461. Are you entitled to employ any colliers ?—No, only what the day manager or day overman employs. There is no work with us by night on the coal, only in places where there is double shift, so that we have no need to employ colliers.

27462-9. Does the manager or under-manager of your colliery employ the colliers ?—The overman employs the colliers and the manager signs for them in the morning.

27470. Is your evidence to some extent given on behalf of the management and owners as well as on behalf of the overmen ?—I answered the questions so far as my own ability was going, as you see them there now.

27471. I should like to know whether this evidence of yours was strictly on behalf of the 230 members of the Colliery Officials' Association, or whether it is not partly on behalf of the colliery owners of South Wales ?—It is on behalf of both of them.

27472. How long does it take the fireman to examine 45 places under his charge in the morning ?—About 2½ hours.

27473. About 2½ hours to make the morning examination ?—Yes.

27474. That would mean five hours for the two districts if one fireman had to examine both those districts ?—Yes.

27475. You, in your 11½ hours, are required to examine both districts ?—Yes.

27476. Your examination of these places would take five hours working alone continuously ?—I am working two districts in the course of time.

27477. What do you mean ?—In the course of my shift.

27478. Quite ; but it would take five hours for you to examine the places ?—Yes.

27479. In addition to that, when making the examination, you have all the duties which Mr. Abraham went through in those rules ?—I have to carry my instructions all through.

27480. Could you say if there are many members of this Colliery Officials' Association in South Wales, in this part, at least, who hold a certificate of competency under the Coal Mines Regulation Act, first or second-class managers' certificates ? Do some of the members of your Colliery Officials' Association hold first or second-class managers' certificates ?—Yes.

27481. A number ?—Yes.

27482. Do you yourself hold a certificate ?—No.

27483. Do you know what proportion of the overmen employed at your colliery hold a certificate ?—Yes.

27484. You said 10 overmen were there, I think ?—Yes. Three out of the 10 hold a certificate.

27485. Are the wages of the night or day overmen higher than the wages paid to the firemen ?—Yes.

27486. Do you think that that wage is sufficient to encourage the best men to take employment as overmen ?—Yes, I believe it is.

27487. You think they are quite fair wages for the workmen ?—Yes. I cannot answer for other collieries.

27488. I mean as a whole, not at this colliery particularly, but as a whole, over your coalfield ?—I do not know ; I could not say.

27489. I was going to say that you are about the only contented people I know if you are quite satisfied at the present time. Will you tell the Commission why a collier is the best man to do the timbering to secure his working place ? What is the reason of it ?—He is not supposed to have a place without he is a thorough practical man to look after his own safety.

27490. I mean a thoroughly skilled collier and timberman. Why do you say he is the best man ? If you had a timberman who had had considerable experience in timbering, he would be as good a man as the collier ?—Yes ; taking charge of his own place and general safety of his working place, I mean.

27491. A collier has to do something else besides timber his place. He has to get coal and fill it ?—Yes.

27492. He is paid by the ton ?—Yes.

27493. Are all your workings longwall workings ?—All longwall. Some part of the mine is barriers.

27494. (*Mr. Wm. Abraham.*) That is longwall in a broad sense ?—Yes.

27495. (*Mr. Smillie.*) The collier being paid by the ton is sometimes tempted to neglect danger. Perhaps the danger of a bad stone may be neglected because of his being anxious to get out as much coal as possible ?—Yes.

27496. Some accidents may arise from the collier neglecting to timber where he should, if in a hurry to get a tram filled ?—Yes.

27497. If there was a man in charge of six or eight places with nothing else to do but timber those places, there would not be the same neglect on his part, because he would not be paid by the ton ?—No.

27498. You complain that the men do not work regularly. What do you call irregular work ?—A man not attending to his work regularly, when he is ill.

27499. Would you say if a collier attended five days a week at the pit that would be fairly regular ?—Yes.

Digitized by Google

27500. You would not expect him to be there six days every week ?—No.

27501. You would not complain if a workman took one play-day in a week. If he attended five days a week all the month round, that would be reasonable ?—Yes.

27502. What you object to are people drinking and lying off for three or four days and then coming in to work ?—Yes.

27503. I think you will admit that there is extra danger arising from that ?—Yes.

27504. I was wondering whether you wished to lay down that a collier must work every day that a pit is open ?—No, I do not suggest that. I only say the danger is this, by allowing it to stand.

27505. When a collier has been off three or four days and the place is standing, it gets broken; the other places going forward bring weight on it, and it makes it more dangerous ?—Yes.

Mr. W. Griffiths.

16 July, 1907

27506. Does the collier require to put his place in order when he comes out ?—If he does not we have to put a timberman there.

27507. What is the custom ?—The collier himself does it.

27508. Your previous answer, although I think you did not mean it, led Mr. Davis to believe that you had to put men on to put it in order before the collier started, but the collier himself has to repair it if gone out of order through his being away ?—Yes.

27509. If a man is off with sickness, and his place gets badly broken you would be entitled to put it right before he started ?—If a man is ill we put another man to keep his place going, but when a man is on the spree you cannot put a man in his place.

27510. He requires to put men on when he comes out ?—Yes.

Mr. JOHN WILLIAMS, called and examined.

STATEMENT OF WITNESS.

Mr. J Williams.

27511. (1) *Safety Lamps.*—I am of opinion that, with the exception of the prohibition of the old-fashioned screw-locked lamps no further restriction is necessary. I object to double gauze on the lamps because it is impossible to get sufficient light, and the lamp soon gets hot and clogged.

(2) *Use and Firing of Explosives.*—I am of opinion that it might be made compulsory for the holes to be charged by officials instead of allowing this to be done by the men as is permitted at present. If might also be made compulsory for the workmen to purchase their explosives from the Colliery Owner and not be allowed to bring it to the colliery from the outside, so that the officials of the colliery could be certain that the proper kind of explosive is being used.

(3) *Falls of Roof and Sides.*—I think that it would be very advisable that men applying for the position of colliers, repairers and hauliers should produce certificates showing the length of time they had been in their last employment, and the amount of experience they had had in these departments, so as to prevent the employment of inexperienced men in these capacities. These falls are frequently due to the irregular attendance at work of the men, and the rules are sufficiently stringent if properly carried out, combined with more regular work.

(4) *Haulage.*—A number of accidents happen from the men not using the man-holes on the engine planes, and although the employers are compelled to provide these means of safety for the men, they have no power to compel the workmen to use them. I am of opinion that the Special Rules might be made more stringent in this respect.

(5) *Special Rules.*—I am of opinion that the present Special Rules are far too numerous and too complicated, that there are too many repetitions, and that a large number of the men do not attempt to acquire a knowledge of these Special Rules. I think that they could be made much simpler. I am of opinion that it would be a great advantage if boys were taught these Rules in the last year in school. It might also be advisable if the Special Rules for each section of men were printed and supplied to these men separately, instead of in a considerable pamphlet, with the rules for officials and others, as they are at present.

(6) *Administration of the Mines Act.*—I think that discipline in mines is improving, but something might be done in the way of giving more power to the officials to enforce the necessary orders.

(7) *Standard of ventilation.*—I think that it is absolutely impossible to lay down a standard of ventilation, and that General Rule No. 1 is sufficiently stringent if properly carried out. In view of the fact that some districts require a much larger quantity of air than others of the same size, and that the same district even requires a larger quantity of air at certain times, it is impossible to fix any standard quantity of air.

27512. (*Chairman.*) You represent the South Wales Colliery Officials' Association, which consists of about 230 members, officials in the bulk of the collieries in the Rhondda, Merthyr and Aberdare Valleys. What proportion do you think of the officials of those mines belong to your Association ? Do you think most of them belong to your Association ?—Yes.

27513. About nine out of ten ?—Yes, the most part.

27514. Do I understand that you have had any conversation with the Association with regard to your evidence ? You have talked to the Association about the evidence you are going to give to-day ?—Yes.

27515. The Association knows the evidence you are going to give ?—Yes, I was before them and was selected to come before you.

27516. Have you shown them what you intend to say ?—Yes, I have it here.

27517. I notice in some respects your evidence differs from that of the last witness, who also appears for the Association. For instance, on the question of lamps, you object to a double gauze lamp ?—Yes.

27518. Do you think you represent the views of your Association in objecting to double gauze lamps, or do you think that Mr. Griffiths' view is more in accordance with the opinion of the Association ? He says he wishes double gauze lamps to be used, and you say that you do not wish double gauze lamps to be used ?—It is the views of the Committee selected from the Association, the most expert mining engineers in South Wales.

27519. You represent their views. Mr. Griffiths, apparently, on that point does not represent their views ?—No, not of the Committee.

27520. He may represent the views of the majority of the members of the Association, but you do not think that he represents the views of the Committee of the Association ?—I do not believe that the majority of the members of the Association are in favour of the double gauze lamp.

27521. Neither the majority of the Committee nor the majority of the Association are in favour of the double gauze lamps ?—No.

27522. With regard to the use of explosives, you think it ought to be made compulsory for the holes to be charged by officials. In some mines that is done, but in some mines it is not. In some mines it is made compulsory by the management ?—It is not compulsory, but I believe it ought to be made the law.

27523. There are no Special Rules in your district obliging officials to charge the holes, but, as a matter of fact, in a great many mines the management insist, without a Special Rule, that officials shall charge the holes. Is that not so ? In many mines it is the practice for the officials only to charge the holes ?—It is not carried out in that way in my colliery, where I am at present, but I have been in collieries where it has been carried out.

27524. You think there ought to be a Special Rule that should apply to every mine in your district ?—Yes.

27525. You say it ought to be made compulsory for the workmen to purchase their explosives from the colliery owner, and not be allowed to bring them to the colliery from the outside ?—Yes, entirely.

27526. With regard to falls of roofs and sides you think that it would be very advisable that men applying for the

Mr. J. Williams.

16 July, 1907

position of colliers, repairers and hauliers should produce certificates showing the length of time they had been in their last employment and the amount of experience they had had in these departments, so as to prevent the employment of inexperienced men in these capacities. The last witness said he thought the same result might be obtained in another way by insisting upon some public examination of men, or rather that they should be compelled to produce certificates of employment. He thought there ought to be some examination?—Yes, I quite agree, so that we may know what the men are. In my colliery district you will get somebody asking for work who has never cut coal in his life: perhaps he has been employed underground as a labourer, or he will ask for work as a haulier and say that he has been driving. Perhaps he has been driving outside, but not underground.

27527. I understand sometimes that the men have objected to the system of certificates and do not like to be placed in the hands of the managers to the extent of being obliged to produce from any mine where they have worked a certificate of exactly the character of work they have done, and how long they have been doing it, and whether the manager thought they were competent to do it or not. They would prefer, I understand, that they should undergo some public examination which would test their capacity, and that it should not be left to the management to give them certificates?—There ought to be something to meet the 232nd Special Rule.

27528. (*Mr. Ratcliffe Ellis.*) That is that no unskilled person shall work alone?—Yes.

27529. (*Chairman.*) The question is how we are to carry that rule into effect?—Yes.

27530. There might be two ways. You suggest when a man goes from one mine to another and applies for work that he should carry with him a certificate as to the time he has been employed in a particular work, and the kind of work, and whether he is competent or not to do the work. That is one way of doing it. That would leave the whole responsibility on the management. It has been suggested, on the other hand, that it might be undesirable to leave these powers in the hands of the management of the mine, but that the same result would be obtained, perhaps better, by the men having to undergo some examination; for instance, that a man should not be employed in hewing by himself (of course he must learn how to be a hewer under somebody else) unless he had passed an examination or test which would show that he was a competent hewer?—Yes.

27531. Then you object to the irregular attendance at work of the men and consider that falls are frequently due to irregular attendance. How would you deal with the irregular attendance of the men?—It is not dealt with strictly enough. Men lose their work and cause accidents to a collier working in advance. I believe there are a lot of accidents from falls of roofs and sides owing to the men losing their work. One face has gone on and another one will be behind. They occur through the roof breaking and the timber breaking.

27532. We understand that, but can you suggest any system to obviate that and enable every face to be worked at the time it ought to be worked so that the whole work might go on steadily. You cannot expect a man always to come to work, he might be ill?—We do not expect him to come when ill, but some waste their time. There are good workmen employed underground as hauliers, colliers, repairers and stowers, but there are very bad ones too.

27533. You have no suggestion to make on the subject; all you say is that it is desirable the men should work as regularly as possible?—Yes.

27534. You say that the rules are sufficiently stringent if properly carried out?—Yes.

27535. With regard to haulage, you say a number of accidents happen from the men not using the man-holes on the engine-planes, and although the employers are compelled to provide these means of safety for the men, they have no power to compel the workmen to use them. I suppose you mean refuges by man-holes?—Yes.

27536. I should have thought when a man saw there was any danger he would go to a manhole to shelter himself if he could?—There is no law to compel him to go.

27537. Do you require a law to compel a man to go into a manhole when in danger from a tram?—What about timbering; there is a law to that effect?

(*Mr. F. L. Davis.*) I think he means the overman will tell the men they must go into these places, but they do not do it.

27538. (*Chairman.*) They do not attend to what they say. You tell the men it is their duty when there is any appearance of danger to take refuge in these manholes, and they do not do it?—When a workman sees there is a law, and you can prosecute him for not doing so, he will keep that better in his mind when travelling over haulage roads. I think he would be more likely to turn into a manhole or a place of refuge.

27539. You say that the present Special Rules are too numerous and too complicated, that there are too many repetitions, and that a large number of the men do not attempt to acquire a knowledge of these Special Rules, and that they could be made much simpler. You suggest that these Special Rules should be re-written and made very much shorter?—Yes.

27540. You think everything that is necessary could be put in much shorter form than it is at present?—Yes.

27541. You also think that the Special Rules for each section of men should be printed and supplied to these men separately?—Yes. May I draw your attention to No. 188 of the Special Rules: "No person, except a shotman when firing a shot, shall, under any pretence, or for any purpose, unlock a lamp in his charge in any place in the mine, or take the top or shield off a lamp except at a lamp station."

27542. What do you wish to say about that?—He should not be allowed in any case to unlock his lamp.

27543. Not even a shotman?—No.

27544. (*Mr. Ratcliffe Ellis.*) How long has this rule been in existence?—Ever since I remember.

27545. In the early days, when these rules were first formed, how did they fire their shots—by a fuse?—Yes.

27546. They fired them by lighting a fuse?—Yes.

27547. Where did they get the light from?—By placing a piece of touch paper on the gauze of a Davy lamp until it lighted, and afterwards firing the fuse with it; or by inserting a wire through the meshes of the gauze of a Davy lamp until it got red hot, and afterwards light the fuse with it. The above was the general practice in fiery mines; after this the Rule was altered, giving permission to shotmen to open lamps for the purpose of firing shots.

27548. (*Mr. Wm. Abraham.*) That rule ought to be removed?—Yes.

27549. (*Chairman.*) You say that it would be a great advantage if boys were taught these rules in the last year in school. Do you think it ought to be made compulsory that boys before going underground should be examined in these rules and in the provisions of the Coal Mines Regulation Act?—Yes, I believe so. They ought to be taught in that direction, because 80 out of every 100 of our boys that are taught in school in the colliery districts go to work underground.

27550. Then with regard to the administration of the Coal Mines Regulation Act, you are of opinion that discipline in mines is improving, but something might be done in the way of giving more power to the officials to enforce the necessary orders. What powers would you require? What powers have you now, and why do you think them insufficient? In what respect are they insufficient?—That is as regards the manholes, as pointed out in the Special Rules.

27551. Is that the only suggestion?—Yes, that I remember.

27552. Do you think that the officials should be empowered to place the men under penalties to provide for their own safety better than they do apparently at present?—Yes.

27553. You have no particular provision in your mind by which that could be done?—No, I do not remember now.

27554. You have no proposal to make on those lines?—Yes. Special Rule 244 should be strengthened.

27555. Then we come to the standard of ventilation, and you say that Rule No. 1 is sufficiently stringent if properly carried out, and in view of the fact that some districts require a much larger quantity of air than others of the same size, and that the same district even requires a larger quantity of air at certain times, it is impossible to fix any standard quantity of air. Do you say that in every case where there is a cap on a safety lamp the men should be withdrawn from the working?—No, I do not believe so.

Digitized by Google

27556. Would it depend on the size of the cap or the class of lamp employed, whether colza oil or petroleum ?—Of course, when the cap extends up to the gauze it is dangerous, and we have to withdraw the men.

27557. You think a small cap on the lamp does not indicate danger ?—No ; where there is no shot-firing going on there is no danger whatever. I have been working years with a small cap, more or less, as far as one-eighth of an inch.

27558. Have you any idea what you would consider a dangerous cap ? How big a cap would be dangerous, in your opinion ?—Any indication of gas will be dangerous where there is a shot to be fired.

27559. Independently of shot-firing in an ordinary working place, where there is no shot-firing going on, what sort of a cap do you consider dangerous ?—I do not think there is any danger in an eighth of an inch cap.

27560. Is there any danger in a quarter of an inch cap ? —I cannot follow that experimentally like that, but I have been working several times in places where there was a quarter of an inch cap.

27561. You have not thought it necessary to leave the working because of a quarter of an inch cap ?—No.

27562. Did you think a quarter of an inch cap was a safe cap ?—I would not say a quarter of an inch ; I would say one-eighth of an inch.

27563. One-eighth of an inch would be perfectly safe, but you have often worked with caps of a quarter of an inch and not left the working ?—I believe it is almost impossible to keep a colliery without any indication of gas, that is in some places, between the place that receives the air last and the main return. It is impossible in fiery mines.

27564. You find it difficult to lay down any rule as to the size of the cap which indicates a dangerous accumulation of gas ?—I should think it is impossible to lay one down.

27565. (*Mr. Wm. Abraham.*) Have you been allowed to work in an ordinary working place—not the last place where the air goes into the return, but an ordinary working place in any colliery in the district, where there was a quarter of an inch of a cap on your lamp ?—Yes. That is an ordinary working place in the last place. That may be working continually every day.

27566. That last place is one place out of 500 ?—Yes.

27567. Come back to the middle of the workings. Have you been allowed to work in any ordinary working place inside the collieries where you had a quarter of an inch cap on your lamp ?—Not in the middle of the workings.

27568. What part of them ?—The place nearest the return.

27569. Is that the one place ?—Yes, or in the return.

27570. Do you know of a man being allowed to work any districts in any colliery in South Wales where there is a quarter of an inch cap on a lamp ?—Not in a district in the centre, but in the return you will get it occasionally.

27571. You answered the question generally to the Chairman ?—Yes.

27572. (*Chairman.*) Is that a distinction ? It is the worst place. You are putting it just before the returns in the last working face before the return airway, that is the place where the gas is most likely to be found ?—Of course it would increase by going all round through the working places, the strata giving out gas here and there, and the ventilation carries with it all the noxious gases by passing by and into the main return, and in the last place or the couple of last places nearest the return you will find the gas the greatest.

27573. (*Mr. Ratcliffe Ellis.*) If there is any at all, that is where you will find it ?—Yes.

27574. (*Chairman.*) If you found a quarter of an inch cap anywhere else but in this most gassy place of all you would leave them working, but if you found it in this particular place, where you are likely to find the greatest accumulation of gas, you would not let them work ?—I would not like to say that. I say what I have been doing myself. I am speaking from a practical point of view. I am speaking of what I have been doing, and nothing did happen.

27575. You would not like to say that you were quite in safety ?—It would be safer without any indication at all.

27576. Do you say you have worked not in these middle workings but at the end where the gas would accumulate most when there has been a quarter of an inch cap shown on the lamp ?—Yes, I have.

27577. Do you consider that it was right that you should have worked there. Do you think it was safe ?—It was rather dangerous.

27578. A quarter of an inch cap wherever it is is rather dangerous ?—Yes.

27579. An eighth of an inch cap in the beginning of the return airways or the last working face before you get to the return airways is not dangerous ?—No.

27580. A quarter of an inch cap may be dangerous but an eighth of an inch cap is not dangerous ?—No.

27581. (*Mr. Ratcliffe Ellis.*) With reference to the irregularity of the attendance of the men, you think that is a source of danger ?—Yes, greatly.

27582. That, I am afraid, is something which Acts of Parliament cannot alter. You cannot make a man attend regularly to his work by Act of Parliament ?—There is a law to that effect now, that the management can prosecute a person for not attending and wilfully neglecting his duty.

27583. Do you think that the institution of general prosecutions for this non-attendance would improve the attendance, or do you think that it is so ingrained in the nature of the men that that would not do any good ?—I was instructed by the Committee of the Association to bring the question before you.

27584. You would rather this Commission formed an opinion than you offered an opinion ?—Of course there is a law to that effect now.

27585. You wish the Commission to consider whether they make a recommendation that that law should be enforced. You say it is a source of danger and you leave it to the Commission to say how that might be mitigated ? —Yes.

27586. With reference to the qualification of men who come for employment, I understand you to say that you are under the obligation yourselves not to employ any unskilled men. Your rules say no person unskilled in any particular work is to be employed in that work, but you have no means of ascertaining whether a man is skilled or not who applies for the employment ?—We have no means.

27587. Your complaint is that you have not sufficient means of ascertaining the qualification of a man who comes to apply for work ?—No, there is not.

27588. Do you suggest that every collier should have a certificate of competency ?—Yes, collier, haulier and repairer.

27589. The man who gets the coal, the coal getter ?—Yes.

27590. Do you say the collier ?—Yes.

27591. The haulier and the repairer ?—And the timberman.

27592-3. Do you suggest that every class of labour in a mine should be certified as competent after examination ? —I should say about the firemen that they ought to go through an examination with regard to the Special Rules. You must not make it too hard or else we should lose the best practical men employed in the colliery.

27594. You agree that if a very stiff examination was made for firemen you might lose the best men that you have now, who are doing their duties satisfactorily ?—Yes ; but it would be a good thing, I think, for them to pass an examination; that is, as regards the Special Rules, the Coal Mines Regulation Act and Ambulance.

27595. These very good men whom you do not want to lose have not certificates now ?—No, there is not one out of every 10 of our firemen in South Wales who has a certificate, but they are thoroughly practical.

27596. They are good men ?—Yes.

27597. A certificate would not improve them ?—No, but it would improve the ones coming in their places.

27598. These men have got to this state of efficiency without an examination at all. Why should not other men do the same ?—There are some black sheep amongst the white ones.

27599. It is to keep the black sheep out that you want these certificates ?—Yes, I think no fireman should be allowed to be a fireman under from 26 to 30 years of age. Persons ought to have ten years' experience underground before being appointed fireman.

Digitized by Google

Mr. J. Williams.

16 July, 1907

27600. You can be a manager at 23?—I take it the fireman's duty is the most important office of officials underground.

27601. Should he not be appointed before 26?—26 or 30.

27602. What is he to do up to that time?—Work as a collier, a haulier or a repairer, the same as myself. I have worked underground since I was between eight and nine years of age.

27603. You think firemen are best selected from the colliers. Their business is not like the colliers—getting coal, it is a different kind of work—inspection. Do you think the training of a collier best qualifies a man to act as a fireman?—General knowledge of working underground.

27604. Take the coal-getter. Is that training the best training for a man going to be an examiner or a fireman?—A coal-getter or a timberman and haulier as well. Of course general knowledge is the best.

27605. Would a second-class certificate suit you, or would you have some other examination?—I believe that would be too stiff for a fireman to pass.

27606. You want something less stringent than the second class?—Yes, much below.

27607. Take the men who get the coal: do you think they should be required to have certificates of competency also?—The management ought to know somehow what had been their experience.

27608. It is desirable that all the men engaged in the mine should be competent, but the thing is whether it is practicable that every coal-getter should be required to pass an examination and obtain a certificate?—I believe they have to pass their examinations in America.

27609. This is England or, rather, Wales. Do you think it is a practical suggestion that a man should not be allowed to work as a collier until he has passed an examination and obtained a certificate of competency?—I believe you would not have so many accidents if you have real practical men as coal-getters.

27610. If you had all practical men and all careful men, probably you would have fewer accidents?—I believe so.

27611. You cannot obtain carefulness by an examination or a certificate of competency?—No.

27612. Therefore, it would not help in respect of that. Do you think there is such a state of things in connection with mines in Wales that the general run of colliers are so incompetent to do their work that it is a source of danger?—I believe, as a general rule, the workmen of South Wales are the best men in the world as underground miners.

27613. They are fully competent to do the work?—There are some——

27614. There are some, I have no doubt, everywhere that are not competent in every class. Do you suggest that there should be a law passed that no man should be allowed to work as a collier who had not obtained a certificate of competency by examination?—No. I believe that we would lose half of our colliers, because they could not pass the examination.

27615. You do not think it is a practical suggestion?—Not for colliers.

27616. Now take the haulier, the man who works on the road. There are boys working on the road?—Yes.

27617. They get to be young lads and then to be men and they get their experience as they go along?—Yes.

27618. At what stage would you have this examination passed in the haulier's career?—I do not know. I suggest the certificate should be for colliers, hauliers or timbermen.

27619. I am speaking of hauliers. When do you suggest that this examination should be passed. A boy gets into a young man and works on the roads and so on until he gets into a more important position. When is he to pass his examination?—I think there is a law to the effect that a boy should not drive before he is 18.

27620. At what stage in his career, which is an advancing one, is he to pass an examination?—How many years ought he to have underground, do you mean?

27621. I want you to tell me when he is to pass an examination. The men who work on the roads begin as boys and they go on growing into young men. They are hauliers in one sense all the time. When is he to be stopped working unless he passes his examination?—I do not think examination will suit colliery hauliers very well or either of them.

27622. I am not advocating this. You say a person should not be allowed to work as a haulier unless he has obtained a certificate by examination. He should not have a horse under his care until he is 18 years of age, and until he has had two years' experience underground.

(*Mr. Smillie.*) Showing the length of service with the last employer.

(*Mr. Ratcliffe Ellis*) It is not a question of service; it is a question of competency.

(*The Witness.*) If the workman has been in the same colliery, or if we knew the person, there would be no objection because we would know what he had been.

27623. The suggestion is that this information should be conveyed to you by the fact that a man is able to produce a certificate of competency which he has obtained by examination. You say that all persons working in the pit should be subjected to that, but we have excluded the collier because it would not be practicable. The fireman you think is desirable. Now I am talking about the haulier. Is it practicable that the haulier should have a certificate of competency obtained by examination before he is allowed to work as a haulier?—Yes, to cover one colliery to another.

27624. He may be a competent man and pass no examination at all and yet be fully competent to do his work at one colliery, but before he obtains employment at another he has to pass an examination to obtain a certificate. Is that the idea?—Yes.

27625. That is the best you can suggest on that subject?—Yes.

27626. With reference to the powers of officials, what more power do you suggest that the officials should have?—I referred to the rule about entering manholes. The official is powerless as regards telling a person to go into a manhole. There is nothing in the rules to compel a man to go there.

27627. Is that the only point upon which you think the officials should have more power?—If a person has wilfully misconducted himself there should be a law behind the official that he can send him out from the colliery.

27628. Do you want the official authorised by Act of Parliament to discharge a man who misconducts himself?—Yes, or prosecution, as the case may be.

27629. You have that power now?—I do not believe you can dismiss a person from a colliery. He can demand his month's notice.

27630. It depends on the misconduct. If a man was doing something which would endanger another person's life you would be entitled to dismiss him. In what direction do you think the official should have greater power. You can put into operation the provisions of the Coal Mines Regulation Act, and if a man breaks a General or Special Rule you summon him before the magistrate. Do you know that?—Yes.

27631. What more power do you wish to place in the hands of the officials? Do you want to compel a man to do what he is told to do. Is that the power you want?—Yes, that is one rule.

27632-53. It would be a most useful thing if you could suggest any way by which you could get that except by prosecuting or punishing the men if they did not do it. Except with regard to the use of the manholes, you suggest no other way in which the officials' power should be extended. Is that so?—No.

27654-6. (*Mr. F. L. Davis.*) What you want, I think, from what you said, is better discipline in the collieries?—Yes.

27657. Is it your experience that frequently men will not do what they are told to do when it is for their own safety or when their own safety is involved?—It is sometimes the case that they will not do what they are asked to do.

27658. You have given an instance of a man not going into manholes or places of refuge. Have you ever found men riding on journeys, which is strictly against the Rules?—I have not myself, personally, but others have, and they have been prosecuted. There is a law to that effect.

27659. Take cases of that kind, that is what I wanted to put to you. Officials in charge, if they see anything of this kind, would have to tell the men they are not to do it?—Yes.

27660. In spite of that the men do it, and very often accidents happen?—Yes.

Digitized by Google

27661. You can prosecute for a number of these things ?—Yes, for riding on the shackles.

27662. Do you, as a matter of fact, yourself, in your colliery, prosecute when you find men disobeying orders ?—Yes ; I have never, myself, come across one riding, except when he is authorised to do so. Of course, there are riders. You must allow them, or else it will be one hour until they reach their destination.

27663. That was only an instance. I mean anything that is a breach of the Special Rules in the colliery anywhere of any kind. Do you prosecute in your colliery when you find a man breaking the Special Rules ?—Yes.

27664. Do you do it often ?—Not very often. I have not prosecuted one where I am now, at Cwmaman.

27665. What do you do the first time a man breaks the Special Rules ?—Report him to the manager.

27666. You warn him ?—Yes, and report him. In some cases we report to the manager. The men say they will not do it again. Of course, if you prosecuted every man who is not carrying out the Coal Mines Regulation Act and the Special Rules you would have plenty of work : you would have to prosecute every shift.

27667. I quite agree with you there. It would be impossible to prosecute every man for every breach, but if prosecuting were a little more general do you think, or do you not think, that would have a good effect ?—I do not believe in the system of prosecuting, myself. I believe more in inducing persons to learn, but we want the law to meet the case of a stupid sort of man. There are very few of those who are employed amongst us underground. The man who has common sense will not require anyone to tell him to get out of the way on the journey, but there are fools who will run out. Most of the men, even myself, going in take more time than coming out. They run, and do not consider where they are going. It is a very important point in case of hauling to get some law.

27668. Mr. Ellis asked you, and you were unable to tell him, by what process you were going to compel a man to do what he is told to do, even for his own safety ?—Prosecute workmen, and the others will take warning from them.

27669. You can do that at present ?—No, there is no law to that effect, no law to the effect that you can compel a person to go into a manhole. You cannot compel a pesson if he will not go into a manhole.

27670. Whatever Act of Parliament you have you can never compel a man to do what he does not want to do ?—You can prosecute him.

27671. If he does not do what he is told, you can prosecute him, and you think, probably, if you do that discipline will be better in the future ?—Yes.

27672. How many men are there in your district ?—In the colliery ?

27673. You are overman of a certain district ?—I am overman of the whole colliery by night.

27674. How many men would be working in the colliery at night ?—200 colliers, hauliers, stowers, and repairers and assistant repairers.

27675. You are the night overman ?—Yes.

27676. Is there only one day overman, or two ?—Two day overmen, and one under-manager employed in that colliery.

27677. There will be more men employed by day than night ?—I should think about three times the number.

27678. You said with regard to the cap on the lamp that it would be impossible to lay down any rule that would apply everywhere with regard to the size of the cap ?—Yes, it is impossible to lay down a rule, because the colliery would give out more gas to day and less to-morrow. There is a rule among experts and mining engineers, but one says 32 or 33 cubic feet will dilute one cubic foot of marsh gas ; others say 40 and others say 40 to 50. The underground work is very changeable as regards giving out marsh gas from the strata, and depends on the number of men working, the horses and so on.

27679. You say that the nature or the size of the cap would indicate the danger ?—Yes.

27680. Being one-eighth or one-sixteenth of an inch would tell you nothing, but if you had two caps both one-sixteenth of an inch, the nature and the look of them would indicate whether one was more dangerous than the other ?—Yes. The greater the cap the greater the danger may be ; that is if it is pure marsh gas, or a light carburetted hydrogen, but it is not so dangerous when it is diluted with carbonic acid, or sulphuretted hydrogen.

27681. It is impossible to lay down the particular size of cap that would be dangerous in every colliery district. You speak of South Wales. We will say South Wales alone ?—Yes.

27682. You think Rule 1 as to an adequate amount of ventilation meets the point ?—Yes.

27683. As it stands that is what you want ?—As far as it is reasonably practicable. I do not believe you can do anything to remedy the first rule on ventilation.

27684. Introducing the size of a cap would not be any improvement ?—Nothing at all.

27685. How long ago was it that you worked in a quarter of an inch cap ?—Three or four years ago.

27686. I thought, in answer to Mr. Abraham, you said many years ago you were working in it ?—That is the latest time. I have been working underground since between eight and nine years of age.

27687. Has the ventilation of collieries generally improved in South Wales in the last 20 years ?—Yes, greatly, since I was employed first of all underground.

27688. You do not find men working anywhere in South Wales to-day with a big cap ?—No.

27689. I will not say a big cap, with a cap as big as they used to work 20 years ago ?—No.

27690. (*Mr. Smillie.*) Are you aware that this Commission's purpose is to devise, if possible, some legislation for safety in mines ?—Yes.

27691. Could you give us any assistance to lead us in that direction ? Have you any suggestion to make, or is the legislation of to-day quite satisfactory, providing that a law was passed saying that a person must go into a manhole to save his life ?—Yes.

27692-9. That is the only thing you suggest ?—Yes.

27700. Are the manholes in the colliery in which you are employed kept white-washed ?—Yes.

27701. The purpose of a manhole is to give refuge to a person in the event of a runaway tub, or any danger arising from his travelling on a haulage road ?—Yes.

27702. How does a mine worker find out that there is a danger of a fall from the roof ; to the skilled ear are there indications before a fall takes place ?—Yes, seeing crevices, or there may have been timber breaking, or cracking, or squeezing.

27703. Little bits falling ?—Splinting.

27704. Do you suggest that there should be a clause or a Special Rule put in to give you power to force a man to leave a place where a fall was going to take place ? Have you ever had any trouble in getting a person out from a stone that was going to fall ?—No.

27705. Have you ever had a case of an accident through a person refusing to go into a manhole when told to do so ?—I do not remember, but persons travel together, and one will go into the manhole and the other will continue his journey, and he is knocked down and killed. You want something to draw the attention of a person to these things. He may be thinking about something else.

27706. A law would not effect that ?—Yes, the law has something to do with drawing a person's attention and keeping his mind on a thing.

(*Mr. Wm. Abraham.*) He is going to commit suicide.

27707. (*Mr. Smillie.*) You made a statement that the Welsh miners were the best in the world, and you have probably a pretty high opinion of them ?—Yes.

27708. We may take it they are not more reckless of their lives than any other body of miners ?—Of course.

27709. You think accidents arise through carelessness on their part in not going out of danger into a manhole ?—They are thinking about something else. As I said just now, he wants a post, and he knows the roof has a bad stone, but he wants to fill a tram at the same time. The next time the haulier comes there he wants to get a tram filled. He knows he wants a post there, but he risks his life. I am speaking of the thoroughly practical man, not the careless man, and the stone may come down and kill him.

27710. You have a law at the present time that he should put a prop there, but he does not do it ?—No ; because the man is impractical, but the man has something else to do than putting the post, and when his mind goes from the bad stone to filling the tram, the accident happens.

27711. Supposing it was laid down by law that there must be a sufficient room along every haulage road which

Digitized by Google

Mr. J. Williams.

16 July, 1907

is used as a travelling road, to enable men to stand at the side, do you not think that would save more lives?—It is worse where there is plenty of room between the side of the tram and the tub. You get the men to travel where there is plenty of space, and in that very time the tram may be coming, or a part of the journey, or the whole journey, as the case did happen in Abercynon Collieries, where six men were killed and 50 were entangled among all trams.

27712. (*Mr. Ratcliffe Ellis.*) He means where there is plenty of room there is less inducement to go into the manholes?—Where there is only a small place the men will look for the manhole. My point is this, where there is plenty of room between the trams or tubs and the side to travel the men will not go to the manholes; they will risk and even walk alongside the journey, and when something unusual happens (either his foot slipping or a tram off the road—shackle breaking) an accident often happens, and yet the official is powerless. The Act provides for manholes at stated distances, but does not say that a person must make use of them.

FORTIETH DAY.

Wednesday, 17th July, 1907.

PRESENT:

Lord MONKSWELL (*Chairman*).

F. L. DAVIS, Esq.
ENOCH EDWARDS, Esq., M.P.
THOMAS RATCLIFFE ELLIS, Esq.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. ROBERT SHIRKIE, called and examined.

STATEMENT OF WITNESS.

Mr. R. Shirkie.

17 July, 1907

27713. I have been a winding engineman for 18 years. I have been employed in this capacity at various coal mines in Scotland and at the Gold Mines in the Transvaal, South Africa. To qualify for the discharge of the latter duties, I passed the examination required by the Transvaal Government. I have occupied various positions in the United Enginekeepers' Mutual Protective Association of Scotland. I acted as a Member of the Executive Council, as President of the Association, and I am now Agent and Corresponding Secretary. My Association, which has nearly 1900 enginemen in its membership, covers all the coal fields in Scotland. For some time the Scottish Colliery Enginemen have been agitating for improved legislation, and I have been authorised to give evidence on their behalf. I shall mention the principal of the grievances, which, in their opinion, should be remedied by legislation.

(1) *Employment of Incompetent Enginemen and Stokers at Collieries.*—In this connection, an alteration in our law on the lines of the Engines and Boilers (in and about Mines) Bill is absolutely necessary. The duties which the engineman is called upon to discharge are many and important. His responsibility is very great. In the majority of cases, for a period of 14 hours, and sometimes longer, he is required to raise and lower men at the collieries. At one time or another during every shift the life of every man employed underground depends upon the carefulness of the enginemen in charge. One moment's forgetfulness might be attended with the most serious consequences. We therefore insist, and the miners are entitled to insist, that all men in charge of engines and boilers should be competent to discharge their responsibilities. As the matter presently stands, any person can be employed as a winding engineman. A mine manager can employ any man from the street as a colliery engineman. In many cases, persons absolutely incompetent are appointed to discharge the duties of colliery enginemen, and, in certain instances, the appointment of such persons has been attended with disastrous and fatal consequences. Men are appointed without skill and without experience, and the important nature of the duties to be discharged demands that they should have both. Let me give two recent illustrations as to the harmful consequences of employment of incompetent men:—In the first case, the manager of a colliery instructed a stoker to work the haulage engine during his night shift, besides performing his other duties. This man had no knowledge of enginekeeping, and he allowed the haulage rope to coil out into the winding shaft with the result that one man was killed and three others injured. At the fatal accident inquiry, the stoker stated that he had no knowledge as to working the haulage engine, neither had any of the officials enquired of him as to his competency when he was instructed to work this very important engine. The jury returned a formal verdict, but added a rider, expressing the opinion that the Company ought to employ a competent man on the haulage engine. In the other case, there was a dispute at the colliery between the manager and two of the winding enginemen. The enginekeepers left, and the manager of the colliery employed two men who had not the necessary skill and experience as enginemen. During the first shift, one of the men caused an accident, injuring a number of workmen, and, following on that an accident was also caused by the second engineman with the same result. These, and other cases, of my own long experience as engineman, leads me to conclude that, in the interests both of the enginemen and of the miners employed at the mines, a certificate of competency is necessary. This would not be attended with any great difficulty.

In the Transvaal, where I was employed for some time, every mine engineman requires to pass an examination as to his competency. A small board of examiners, consisting mostly of men having a practical knowledge of the ordinary working, and of the emergencies which may arise in connection with the working of the mines, examine the applicant. The applicants have to satisfy the Board that they are able (first) to perform the ordinary duties of enginemen, and (second) to deal with such emergencies as may reasonably be expected to arise in connection with an engineman's employment, including also a knowledge of the legislation relating to the employment.

(2) *Dangerous Practice of having other Engines (such as Electric, Pumping, Haulage) placed in the same Engine-house beside the Winding Machinery.*—This is a practice which, I am sorry to say, is becoming very common in

Digitized by Google

Scotland, and which, in my opinion, is responsible for many accidents in connection with the winding machinery. The duties of an engineman demand that he should, at all times, have his attention fixed on the winding machinery under his charge, and be able to attend instantly to such signals as may be given to him to raise and lower the cage. In many engine-houses the noises caused by machinery, other than the winding machinery, make it exceedingly difficult, if not impossible, for the engineman to hear and attend to the signals properly. As an engineman usually requires to attend to all the engines situated in the engine-house, it is not possible for him to give the undivided attention to the winding machinery that the proper discharge of his duties requires. Instant attention to the signals often avoids accidents to the men and damage to the plant at the colliery, and this immediate attention cannot be given if the engineman has a number of duties to discharge at one and the same time. When I explain that, in many cases, the signalling bells are not situated in the enginehouse but on the pit-head, it can be understood how, amidst the thundering of other machinery, a signal may be given and not immediately attended to, or how easily such signals may be misunderstood. There is one case being presently dealt with, which illustrates the danger arising in this regard. The bottomer, in this case, was in the act of arranging the hutch in the cage at the pit bottom when the engineman lifted it up with the result that the bottomer received fatal injuries. The pit headman and the engineman declare that the bell from the bottom signalled for the cage to be raised, but the man who assisted in the bottom says there was no signal given, and the bottomer before he died, said that the bell was not touched. In this winding enginehouse there is a pumping engine, which also drives the washer at the pit head, making a great noise, and, in my opinion, making it impossible for the engineman to recognise signals duly given. When an accident occurs the engineman is usually blamed. This is frequently not justified, as, in many cases, the management place duties upon the engineman which he cannot by any possibility properly perform.

(3) *Long Hours of Winding Enginemen.*—It is the custom in Scotland for the enginemen to work 10 hours during the day and 14 hours during the night. The day-shift miners are consequently lowered to their work every morning by the night-shift engineman after he has been over 13 hours on continuous duty. This is a fruitful source of accident to men and damage to mine property. In his most recent report Mr. Robert McLaren one of His Majesty's Inspectors of Mines for Scotland says, under the heading (Shaft Accidents) "This class of accident seems to be on the increase." Under the same heading, and in the same report he says, the accidents "were not caused by ascending cages being overwound, but by descending cages striking the bottom too hard." It is a fact consistent with my own experience as a representative of enginemen, that a great and increasing proportion of the accidents is caused in letting down the men to their work in the morning. This is explained by the fact that the men are let down by the enginemen who are already tired and worn out and cannot efficiently discharge the duties. I have myself, when between 13 and 14 hours on duty, let down hundreds of men, with the most speedy machinery, and I know what a tax it is upon the enginemen and how under given circumstances, accidents may readily occur. Many accidents do occur, but no one except the winding engineman is aware how many accidents are prevented by a true appreciation of danger and the ability to act speedily on an emergency. This cannot be expected, and, as a matter of fact, is impossible, in the case of a man who has wrought 13 hours or more. I am strongly of opinion that all enginemen should be on an eight-hours' working day. This, I am satisfied, would prevent many of the accidents which from time to time do occur, and it would consequently give to the miners, and to the masters, a security of life and plant which they do not at the present have.

I have mentioned 14 hours as a customary night shift with Scotch enginemen, but it is a fact that enginemen and stokers in Scotland work frequently for a much longer period. As far as the law is concerned, there is no limit, and the mine managers cannot be trusted to place a limit where the law places none. When men discharge duties attended with such responsibility as those of colliery enginemen it should not be in the power of the master to employ men, or of the men to work, beyond such a period as may be reasonably expected to be efficient for the discharge of the duties. Many cases have occurred in my experience emphasising the danger which results from this cause. On 13th of June last there was a serious boiler explosion, one man being killed and others injured. Everything was in order from a plant point of view, and the inspector gave it as his opinion that the boiler had exploded from want of water. It was proved that the stoker, who was in charge of the boiler, had been on duty for 36 hours, and the manager said that the stoker had volunteered to do the extra work himself. In my opinion the stoker had no right to work, and the manager should have had no right to employ him for such a long period. In another case an accident occurred in connection with the winding machinery, and one man lost his life. The engineman in this case had been 20 hours on duty at the time of the occurrence. In another instance, occurring in the district where I was employed, the winding engineman had been three shifts on duty when he overwound the cage, and seven men were killed and one injured. As matters now stand at the collieries in Scotland, enginemen have to be on duty 24 hours continuously every week-end for the purpose of changing the shifts. Can it be expected that a man 22 or 23 hours on duty can efficiently lower the whole of the men employed at the colliery on a Monday morning? Until legislation deals with this matter accidents must inevitably occur.

(4) *Enginemen have Multifarious Duties to attend to.*—In most of the collieries in Scotland the winding enginemen have many duties to attend to other than that of winding. It is quite a common practice in Ayrshire, and in many parts of the Lothians and Fifeshire, and also in many parts of Lanarkshire, for the winding engineman, when on night shift, to attend to the firing of the boilers. In many cases at night there is no one about the surface of the mines but the engineman, although there are a considerable number of workmen employed in the mines. Let me give one or two concrete cases in illustration of the practice of which enginemen complain. At one colliery in Ayrshire, where there are 60 men in the mine, the engineman has to attend to one winding engine, one haulage engine, one fan engine, two tube boilers, to fire and clean the boilers and take away the ashes. During the day while employed winding they have to leave the engine-house and go and attend to the boilers. In this case, as in the others I have mentioned, the engineman works 10 hours during the day and 14 hours at night, and during both periods there is a shift of miners in the mine. In a colliery in Renfrewshire, the engineman has at night to attend to the winding engine, to one fan engine, to one pumping engine, frequently to a second winding engine, and to fire five boilers. The Coal Mines Regulation Act provides "that the engineman at the pit-head shall during the hours of his shift, remain in charge of, and so near his engine as at all times to have it completely and entirely under his control." Further that "he shall attend for the purpose of lowering and raising persons in the mine during the time when any person is below ground in the mine." In many cases the engineman has to attend during the night to two or more winding engines, and that while men are employed in a different mine on which these winding engines operate. Under these circumstances, and in the circumstances previously mentioned, it is absolutely impossible for the enginemen to "remain in charge of and so near his engine as to have it at all times completely and entirely under his control." Accidents of the most disastrous kind are possible under such circumstances. In many cases such a time must elapse before the engineman leaves the work at which he is employed and reaches the locus of his other duties as will make the difference between safety and disaster. Where miners are working in both pits, as they frequently are, a long time might frequently elapse before the engineman could attend to that given signal.

I have not dealt with the exceptions, but have taken cases which are very common in their respective localities. The Coal Mines Regulation Act, while it has many beneficent provisions, is insufficient to deal with the various aspects of the engineman's responsibilities. If an engineman objects to the conditions of employment the master's remedy is an obvious one. He does not alter the arrangement, but he changes the engine-keeper. In my experience I have found the Coal Mines Regulation Act to be often so loosely interpreted that it might almost have been non-existent.

To summarise the conclusions at which I have arrived, I would say that in my opinion a great deal can be done to considerably reduce the number of accidents in connection with the winding machinery at mines. I am

Digitized by Google

Mr. R. Shirkie.
17 July, 1907.

convinced that legislation is required to deal with the following questions :—

(1) Certificates of competency for enginemen and firemen.
(2) That only the winding engine should be allowed in the engine-house in which it is working.
(3) That the hours of winding enginemen be regulated by Act of Parliament.
(4) That the Coal Mines Regulation Act should be amended as only to allow the winding engineman to attend to the winding engine during the time that men are employed in the mine.

27714. (*Chairman.*) You are Agent and Corresponding Secretary of the United Engine Keepers' Mutual Protective Association of Scotland ?—Yes.

27715. Your Association has nearly 1,900 enginemen, and covers all the coalfields in Scotland. What proportion is that of the whole number of enginemen ? I suppose you include stokers and persons employed about the engines ? —We do not include stokers. That is engine keepers.

27716. Whom do you include in your Association ?—Mining engine keepers—pumping, haulage, and electrical.

27717. How many persons altogether who are eligible for your Association are working in the coalfields of Scotland ? I want to find out the proportion of men eligible for your Association who join. There are 1,900 who join ? —I expect there is not 5 per cent. outside our Association.

27718. There is another 100 who do not belong to your Association ?—I should say so.

27719. You think you have 1,900 out of 2,000 in your Association ?—Yes.

27720. You have been a winding engineman for 18 years at various coal mines in Scotland, and gold mines in the Transvaal, South Africa. Do you think you gained any valuable experience in the Transvaal for mines in Scotland and other places as regards winding ?—I saw a better system of working, a safer system.

27721. In what respects ?—Being more guarded by legislation.

27722. In the Transvaal you are required to have a certificate ?—Yes.

27723. When you get to the Transvaal the applicants have to satisfy the Board that they are able first to perform the ordinary duties of enginemen, and, second, to deal with such emergencies as may reasonably be expected to arise in connection with an engineman's employment, including also a knowledge of the legislation relating to the employment. It has been suggested before us that it would be well if there was something in the nature of a certificate required from enginemen, and that that certificate should include some examination with regard to the general knowledge of the working of engines, such, for instance, as stoking work, and so on. What do you say as to that ? —I might give you an outline, if you like, of the examination in the Transvaal.

27724. Yes ?—In the first place you are examined on the Coal Mines Regulation Act, you are examined as to your knowledge of your own duties, and the legislation upon that point. Then there is what is known as a boiler law in South Africa. There was under the Boer Government, but I do not know whether there is now. It was a law relating to boilers, and you have to give satisfaction as to your knowledge of the boiler law required by the Government, such as steam gauges, safety valves, tube water glasses, and all those kinds of things. Besides that you are examined on boilers as to cases of emergency, and as to different kinds of boilers. You have to satisfy them with information as to your knowledge regarding the boilers in cases of emergency, and legislation, and all that regarding boilers. Then, coming to the winding engines you are examined on various winding engines, and they seem to be practical men on that Board. My opinion is that the examination they put you through regarding cases of emergency and what you would do under certain circumstances, requires you to have had a very good knowledge and experience of winding engines. My opinion was that one who had not been a winding engine keeper and had not had knowledge and experience in that position could not have passed it.

27725. Do you think this examination in the Transvaal sufficiently tests a man's general knowledge of engines independently of what is required for the purposes of winding ?—It was for the purposes of winding, too.

27726. A man may be competent and know how to work his winding engine, know what handles to turn, and so on, to meet every emergency, but he may not know about the inward mechanism. Supposing anything went wrong, he might not know how to set it right ?—He is examined on that.

27727. That is part of the examination ?—Yes. To give an instance, you are asked to state the course of the steam from the boiler right out through into the air.

27728. You consider that is a model examination, and if we had an examination for engine keepers in this country you would take the Transvaal examination as a model ?—Yes.

27729. You have acted as a member of the Executive Council, as President of the Association, and you are now Agent and Corresponding Secretary. You know pretty well the views of your Association, and are entitled to speak on their behalf not only as to your own views, but the views of the majority of your Association ?—Yes.

27730. You talk about the responsibility of enginemen. I do not think any of us would deny that the responsibility is very great. You say in the majority of cases for a period of 14 hours and sometimes longer, he requires to raise and lower men at the collieries. Is that so in the majority of cases, that he works 14 out of 24 hours in Scotland ?—Yes ; in Scotland the system of working is two men to supply 24 hours. As a matter of arrangement, in order to give the man something like a fair day, he works 10 hours during the day and 14 hours during the night. It comes about that the night shift man is the man that lowers the miners into the pit ; not only so, but in a good many parts of Scotland, which I have evidence to show, they stand what is known as the long term, that is, changing from the day shift to the night shift. They stand at long term on the Sunday and the Sunday night, and it often happens they are 23 or 24 hours on duty when they lower the men to the pit.

27731. You suggest that there should be an eight-hours' day for enginemen ?—Yes.

27732. Three shifts of eight hours, or thereabouts ?—Yes, where it was continuous duty. In some pits that is not required ; the pit can stand eight hours.

27733. Where there is continuous winding up and down during the whole 24 hours with very slight intermission, no man ought to work more than an eight-hours' shift. In some parts of the day or night there would be more winding than at other times, and some men might have a nine-hours' shift and some men a seven-hours' shift ?—That arrangement is in force in some parts of England, but not in Scotland.

27734. You suggest that there should be a maximum of not more than nine or ten hours under any circumstances ?—I would suggest that.

27735. Then you say in many cases persons absolutely incompetent are appointed to discharge the duties of colliery enginemen, and in certain instances the appointment of such persons has been attended with disastrous and fatal consequences. Then you give some of the accidents. Do you say from your experience of enginemen in Scotland that a considerable proportion of the men are incompetent ?—I say that there are men employed who are incompetent.

27736. Some ?—In many cases I have known where they have had to be dismissed.

27737. When they are found to be incompetent they are at once dismissed ?—Sometimes. It depends how it suits.

27738. There might be a fatal accident before their incompetency was found out ?—That is so.

27739. You give an instance of a stoker who had no knowledge as to working a haulage engine, and nobody enquired as to his competency, and he was instructed to work a very important engine, and there was an accident by which a man lost his life. The jury returned a formal verdict, but added a rider expressing the opinion that the company ought to employ a competent man on the haulage engine. Do you know any other case where a jury have expressed that opinion, or is that the only case you know of ?—It is the only case I have cited because it was a recent accident. I attended the fatal accident enquiry about three months ago. It was at Broomrigg, in the Bonnybridge district.

27740. Could you put in the particulars of the coroner's inquest ?—Yes, but I have not it with me to-day. I do not put much stress on bringing newspaper cuttings to a Commission such as this, but I can get accurate information regarding this case from the Law Courts.

27741. (*Mr. Smillie.*) You mean the shorthand notes ? —Yes. I can send them on.

Digitized by Google

27742. (*Chairman.*) We should like to see what the proceedings were in that case. There was another case in which there was a dispute at the colliery between the manager and two of the winding enginemen: the engine-keepers left and the manager of the colliery employed two men who had not the necessary skill and experience as enginemen, and an accident resulted. In that case the engine-keepers left rather suddenly. There was a difficulty?—There was some difficulty with the engine-keepers and the manager.

27743. The manager had to get the best men he could at a moment's notice?—No, they have generally 14 days to work before they can leave.

27744. In this case these engine-keepers gave 14 days' notice?—Seven or 14 days. In this case I am persuaded that the manager engaged these men with the knowledge that they were incompetent men.

27745. Because he could not get competent men?—That is not so.

27746. In his own interest why should he engage incompetent men?—I cannot answer that.

27747. Your belief is that the manager, deliberately knowing these men were not competent, engaged them although he might have got, if not absolutely competent men, much more competent men?—The engine-keepers and those there knew that they were not competent and the manager was informed that they were incompetent.

27748. Notwithstanding this information he took the men on?—He seemed to say he believed they were competent. It was a question of his own belief.

27749. You do not suggest that a manager would, as a general rule, or except in the most exceptional cases, deliberately take a man on as an engine-keeper whom he knew not to be competent, when he could get a man who was more competent?—In general cases I believe that anyone would certainly employ a competent man, but I know there was a time in Lanarkshire, at least, when there were hundreds of men employed who were incompetent and many accidents were caused. It was during a trade dispute.

27750. That is to say, the competent men gave notice and left the works and, consequently, there was a great difficulty in getting competent men?—That is so.

27751. Secondly, you wish to give evidence as to the dangerous practice of having other engines, such as electric, pumping and haulage, placed in the same engine-house beside the winding machinery. This is a practice which, you say, is becoming very common in Scotland?—It has always been very common. It is much more dangerous on account of larger machinery being put up. I know one place in Midlothian where there is an electrical engine in the course of erection to drive the coal-cutting plant below, and it is placed beside the winding-engine, which means that the winding-engine keeper looks after that when it is going. In many places in Scotland they have indicators from pumping engines right in front of the winding engine-keeper. The indicator shows that the pump is working right, and in many cases they have a large bar through where the keeper has to attend to it at the same time as he is working his winding-engine. My own brother, in Blantyre, has an electrical engine and the engine went away rather quick, something went wrong with the governor, while he was letting down the men in the morning. He went to put it right, but went back the wrong way in the excitement of the moment. There were no men injured, but there might have been eight men killed.

27752-3. You think it is difficult for an engineman to carry out his duties satisfactorily if there are other engines in the same place?—Yes. I do not know about England, but in Scotland, so far as the Coal Mines Regulation Act is concerned, it is not in any sense observed. I read in the Coal Mines Regulation Act as regards winding enginemen: "The enginemen at the pit-head shall, during the hours of his shift, remain in charge of and so near his engine as, at all time, to have it completely and entirely under his control." It is quite common in Ayrshire and the Lothians and many places in Lanarkshire and Fifeshire where engine-keepers have to fire the boilers, clean the fires and take away the ashes and attend to various other engines. The winding of the engine seems to come in as a secondary consideration. That is where there are men in the pit. I know in Scotland where they have to leave men in the shaft and attend to other engines.

27754. You refer to an accident happening where the engineman did not receive the proper signal or, rather, did not respond to it owing to the noise of the machinery?—I gave these instances because they were of recent date. The fatal accident enquiry in this case has not come off yet. I was apprised of the accident and went to see it. The pit-headman and engineman say the bell did signal, but the bottom-man before he died said he did not pull the bell, and the man with him said so too.

27755. Before long we shall have an official account of that enquiry?—Yes. My experience is that these official accounts never touch the real crux of the matter. It is generally a formal verdict that is given. What I have suggested here is a thing so common that they will not pay any extra attention to it. A pumping engine is thundering on beside that winding engine which drives the washer at the pit head. The engine-keeper has to pay attention to that engine besides putting up with the noise. Then this accident happened and I went up to see the engine going, but I could not say whether a signal was given or not unless I was watching it.

27756. Do you mean to say that these fatal accident enquiries are not carried out as they ought to be?—I mean to say they are not properly looked into as they ought to be or this would not be possible.

27757. Do you mean to say that when a fatal accident happens and you have an enquiry that everything is not brought out with regard to the cause of the accident?—Yes, I believe that.

27758. You are dissatisfied with the enquiries under the Fatal Accidents Inquiry Act?—Yes; I am dissatisfied with it so far as making recommendations and looking into the real matter are concerned. A formal verdict I believe will be returned in this case. It may not, but that is going according to precedent and that is what I look for.

27759. That is a very serious matter. Under the new Act "The Jury shall state the cause or causes of such accidents or death or deaths, the person or persons, if any, to whose fault or negligence the accident is attributable, the precautions (if any) by which it might have been avoided, any defects in the system or mode of working which contributed to the accident, and any other facts disclosed by the evidence which, in the opinion of the Jury, are relevant to the enquiry." If those statutory provisions are carried out, surely you would have a complete enquiry?—Not very long ago, at Houldsworth in Ayrshire, there was held the first fatal accident enquiry under this Act, which I attended. Two men lost their lives and two were injured. It was on account of the water coming in from the boiler. The engine-keeper had been 13 hours on duty when this took place, but the stoker seems to have let the boiler get too full of water, and the dirty water came in from the boiler and blocked up the valves so that the engine-keeper could not control them. The cage went away and landed on the bottom and he was unable to put off his steam when it landed, and that brought away the cage and killed the men. The cause of these men losing their lives I heard read out was that the cage was lifted away. You have to go further back than that to find out how this could be prevented. The immediate cause is one thing and the causes that contribute to the thing are another.

27760. You say the first enquiry under this Act was not carried far enough in your opinion?—I think it should have been carried further.

27761. You consider the finding of the jury did not give an adequate explanation of the whole of the causes which led to the accident?—It did not give any explanation at all of the causes that led to the accident.

27762-3. It seems to me that the provisions of the Act are not carried out if that is so. If the Act is properly carried out it would be the duty of the jury to go into all these matters, and these matters ought to be brought out at the enquiry?—In my opinion the matters are not looked into as they ought to be, and the recommendations are not made as they ought to be at these enquiries. Formal verdicts are returned.

27764. Can you suggest any improvement in the Act of Parliament which will set that right? It seems to me that the provisions are very stringent?—I do not know so much regarding the recent Act; the former Act, at any rate.

27765. This enquiry which you say was not exhaustive was under this last Act?—Yes.

27766. Can you suggest any improvement of the Act of Parliament?—My suggestion would be that the jury should enquire into the contributory causes and the environment and the reason these things can take place. We know how the accident happened, through the cage

Digitized by Google

Mr. R. Shirkie. 17 July, 1907.

being lifted away. The verdict was that the cage failed to stop when it went to the bottom. Anyone knows that; but why did it fail to stop? What were the circumstances at the time? If these had been taken note of it would have thrown some light on the matter.

27767. (*Mr. Ratcliffe Ellis.*) Were you present at that enquiry?—Yes.

27768. Did you offer any evidence?—I was there on behalf of the Association, and I cross-examined the witnesses.

27769. (*Chairman.*) You brought all these matters out in your cross-examination?—Yes, I brought out as many as I could.

27770. The jury took no notice of them?—Regarding the manager, I asked how long the engine-keeper was on duty, and he said 13 hours. This question was refused at first, but the judge ruled that he should answer it. I asked, "Did he not think that had something to do with the accident," but counsel for the company said that if I suggested that I gave my case away. I say an engine-keeper who has been on duty for 13 hours, although he may not cause that accident, is not in a position to prevent it, as he would be if clearer and more able.

27771. (*Mr. Ratcliffe Ellis.*) Had you the opportunity of saying all that you wished to before the jury?—Yes.

27772. You took advantage of that?—I took advantage of it.

27773. (*Chairman.*) And the jury apparently in their finding ignored a good deal of what you said. That is, they did not refer to some of the evidence you gave which you think they ought to have referred to?—I do not know the juries think they have to refer to everything, whether they may believe it or not; they have to give, in their opinion, the direct cause of the accident.

27774. They did not go far enough back, in your opinion, in investigating the cause?—Yes.

27775. I cannot imagine myself how the Act of Parliament could be amended in order to meet your views more than it does at present. You brought out this evidence, but the jury did not attribute that importance to it you think they ought?—The Act is satisfactory as regards enquiries into fatal accidents.

27776. But the way in which it is carried out is not satisfactory in all cases?—So far as my experience goes. I have not had much yet; it is quite a new Act.

27777. Then you quote Mr. Mclaren, one of the mines inspectors for Scotland, who says in his latest report with regard to shaft accidents: "This class of accident seems to be on the increase;" and then later on he says "that the accidents were not caused by ascending cages being overwound, but by descending cages striking the bottom too hard." I have his report here, and on page 15 he puts it even more strongly than you do?—I have not his report. I depend upon the newspaper for what I refer to.

27778. The paragraph you apparently allude to is this: "Under the division of overwinding, five accidents are recorded, causing injury to 15 persons; these accidents were not caused by the injured persons being overwound by ascending cages, but by being underwound by the descending cages, and striking the bottom too hard. This class of accident seems to be on the increase, and where there is speedy winding, some automatic arrangement to prevent the descending cage striking the shaft bottom with too much force is a necessity." He is strongly in favour of its being compulsory to have an arrangement whereby it should be impossible for a descending cage to strike the ground so hard as to cause injury to the men?—That is so. It seems rather a difficult thing. I believe this is greatly contributed to by the long hours the men have to work.

27779. Then you mention an accident that happened from a boiler explosion where a stoker had been on duty 36 hours. The manager said the stoker had volunteered to do the extra work himself. The stokers are not in your Association at all?—No. I thought I was required to give evidence as regards accidents, and the stoker is connected with the machinery. This is the West of Fife Coal Company. This stoker—whether he volunteered or not is an open question—is dead now, and my case is that he ought not to have been allowed to work 36 hours on such duty.

27780. You give particulars of cases where the engineman has been more than the ordinary 14 hours on duty. In one case a man had been on duty 20 hours; in another instance occurring in the district where you were employed the winding engineman had been three shifts on duty when he overwound the cage, and seven men were killed and one injured?—That is not a recent accident; that is some time ago. That happened in Blantyre. The manager afterwards told me (he is a very particular man) that he would not allow his engine-keepers to work three shifts after that.

27781. There are means of preventing overwinding—I mean mechanical devices by which it can be made impossible?—Yes; but these are conspicuous by their absence in most of the collieries in Scotland.

27782. You think it ought to be made compulsory to have machinery to prevent overwinding?—Yes.

27783. Then in paragraph 4 you say that enginemen have multifarious duties to attend to. You give various instances of that. You have told us already that you think enginemen should only have the one duty to attend to, namely, the duty of attending to the winding engine. You think, for instance, that he should not have any stoking duties?—He must go out of the engine-house to do stoking duties. I may mention a case in Ayrshire, where the engine-keeper was attending to the boilers and the water seems to have broken down below underground, and two men came to the bottom and signalled to get up. There was no answer, because the engine-keeper was attending to the fires, and, as is usually the custom, the engine-keeper finished the duty before he went to the engine, and when he went there was no signal, and it happened that these two men there lost their lives through no one being there to attend to it.

27784. Then you summarise what you want under four heads: First of all you require certificates of competency for enginemen and firemen. You would have a different examination for firemen and enginemen?—Certainly.

27785. Then, secondly, you recommend that only the winding engine should be allowed in the engine-house in which it is working. That you have explained. Then you recommend that the hours of winding enginemen should be regulated by Act of Parliament. You go rather further than that, and say that they should not be allowed to work more than 9 or 10 hours in the 24?—I would say so.

27786. Then you recommend that the Coal Mines Regulation Act should be amended so as only to allow the winding engineman to attend to the winding engine during the time that men are employed in the mine. I think you have sufficiently explained that. Those recommendations, I suppose, are recommendations approved of by your Association?—That is so. There are two other matters I want to refer to. One is the sanitary arrangements in engine-houses, and the other explosives being kept in engine-houses. Explosives being kept in engine-houses is a recent matter. It has been a great grievance of our members with regard to explosives being there, besides the men coming in and out to get them. The mines inspector said he did not believe it was the proper place to keep them.*

27787. What inspector told you that?—Mr. Robert McLaren.

27788. He said that he had no power to prevent explosives being kept there?—To prevent them being there; he said he did not believe it was the proper place for them.

27789. That is contrary to the law. It seems that the Act of Parliament is not attended to as regards the explosives?—You would think that the mines inspector should be able to give a proper interpretation. I have the letter that he sent on this matter, although I have not it with me, with regard to detonators and those things. It is a common thing. At one enquiry I attended it was brought out that explosives were kept in the engine-house and under the house also. One engine-keeper was dismissed because he complained of it.

27790. Complained of these explosives being stored?—Under the engine-house.

27791. What sort of explosives were stored?—Just the usual explosives for the underground workings.

27792. As to a small quantity of explosives being stored it might not be a breach of the Explosives Act?—I understand what is kept in the engine-houses are small quantities

(*Mr. Smillie.*) They are brought from the magazine and placed in the engine-house and distributed from there to the men going down.

* Mr. Shirkie subsequently informed the Secretary that he had communicated with all the Branches of his Association, and had ascertained that though the practice referred to was prevalent a short time ago, there are now very few places where it has not been discontinued.

Digitized by Google

27793. (*Chairman.*) Are they brought in such quantities as would be a breach of the Coal Mines Regulation Act?

(*Mr. Smillie.*) I think not, but it is improper.

(*Witness.*) That is what Mr. McLaren said.

27794. What do you object to in the sanitary arrangements?—In Scotland there is no such thing as sanitary arrangements connected with engine-houses. It is something very distressing to see the state that first-class engine-houses are in as regards this. Offices and other places have lavatories and conveniences, but the engine-houses are entirely destitute of them. Even about the colliery you do not find such a thing. I just wanted to bring it before your notice; not only is it for the convenience of the engine keeper, but it is necessary to allow him to be in a proper state to do his duties.

27795. What is the case in England?

(*Mr. Enoch Edwards.*) It is very imperfect everywhere. They never give a thought to it.

27796. (*Chairman.*) Do you suggest some sanitary arrangements should be made compulsory within a certain distance of an engine-house?—I would suggest at least a recommendation that it requires to be brought to the coalowners' notice. I do not think they would say much against it.

27797. You think it ought to be brought to their notice?—Yes.

27798. Why do you not mention those matters to the inspector?—When it comes to that it means to say that it would be required to be enforced, and the inspector can only recommend.

27799. You do not think that the managers would be averse to having this accommodation provided if they knew that it was desired. Could you not go to them and say that you desired it, or if you preferred you might go to the inspector and ask the inspector to suggest to the manager that it would be a good thing?—I said I did not think they would object. There is very little cost in it.

27800. Why do you not ask them?—We have asked: I have mentioned it many a time.

27801. What do the managers say?—That it was not at any of the others.

27802. Therefore they would not be the first to begin. Have you made representations to the inspector and asked him to make representations to the managers? They could probably get them all to do it?—I would not like to say.

27803. At any rate, you think that is a matter which requires attention?—Yes.

27804. (*Mr. Ratcliffe Ellis.*) What is the experience required in the examination for enginemen in the Transvaal?—Of course, it was a new country to a certain extent, and when I went out to the Transvaal I had to have letters, that is certificates, from my employers in Scotland. They granted me a permit on the ground of these certificates until my examination would come off. They sent me a list of the engines and the boilers that I was required to show my experience of, that is the experience of the engine to know the working of the steam.

27805. They give you written papers to answer?—No, it is all verbal.

27806. They do not give you a certificate because you go before the Board and answer questions unless they are satisfied that you have had practical experience in working the engines?—Yes, in the Transvaal.

27807. Have you the regulations of the Transvaal here?—No.

27808. What length of time do they require you to have experience at an engine?—I think at that time it was two years. I do not know that it was necessary to be two years' winding; it was two years' experience of that kind of work.

27809. What sort of experience?—Such as mine managers. They have to have a certain time in touch with this work before they are eligible to be examined.

27810. Will you consider the winding men? Do they require you to have had two years actually at a winding engine?—I do not remember. I think it was two years' winding you were required to have.

27811. Do you think it would be desirable to give a certificate to a man merely because he understood the construction of the engine, without his having had some experience as a winder?—No, I would not think so. He ought, at least, to have had the same kind of experience as the mine managers have.

27812. That is a different experience. One has to manage the mine, and the other has to wind?—It would require to be on different lines.

27813. There should be a period of apprenticeship, or some period spent at the engine to qualify for the work?—In touch with the work.

27814. You have 95 per cent. of the winding enginemen in your Association in Scotland. How many of those men do you think would pass the examination you referred to in the Transvaal?—I do not know. In the Transvaal, when it came into force, they got a service certificate.

27815. How many do you think could now pass that examination?—I do not know. For the want of that we have a great many men winding that have not got the necessary experience in other ways with their engines.

27816. You do not know how many? Do you think any of them could pass it?—Yes.

27817. What percentage of the men could pass that examination?—The examination I passed in the Transvaal I believe about 60 or 70 per cent could pass.

27818. At least half?—I think so.

27819. Are the other half incompetent enginemen?—I do not believe that they have the knowledge of the machinery that they ought to have when they fill such positions.

27820. The half who could not pass that examination do you look upon as incompetent enginemen?—Not as far as turning the handles and one thing and another are concerned, but I do not look on the engine keepers as having the knowledge they should have of the machinery.

27821. Do you look on those men as incompetent, and consider that it is unsafe for them to do the work they are doing now?—In cases of emergency I believe that knowledge is necessary as well as the experience.

27822. Can you say in your view that 50 per cent. of the men could not pass that examination?—I did not say 50 per cent.; I said about 60 or 70 per cent. could pass.

27823. Do you think that those who could not pass are not competent to discharge their duties safely?—I do not believe they are as competent as they ought to be.

27824. In the Inspector's Report for last year there are no fatal accidents from over-winding: there were five accidents causing injury. Do you think that a bad record in a year with more than 1,900 enginemen, because there is another five per cent. who are not in your Association?—I did not say there were 1,900 winding enginemen. I do not know that. Over half are winding enginemen.

27825. I will take 900, and five per cent. on the top of that. Do you think, looking at the fact that last year there were no fatal accidents, and only five non-fatal accidents, that justifies you in suggesting these men are not competent to discharge their duties?—It is not as regards the proportion of fatal accidents we ask this. We believe the fatal accidents are not a true criterion to go upon.

27826. I am taking the fatal and non-fatal accidents in last year. Is not that a very good record?—You might apply the same to all others, such as mine managers, or dentists. You might say there is no need for certificates.

27827. I should like you to keep to the engine-winders?—We must consider precedents.

27828. The question is as to the competency of the present winders. Do you think the fact that out of millions of windings in that year up and down the shaft there are no fatal accidents and only five non-fatal accidents is a record which justifies you in coming to the conclusion that the men who do this work are not competent?—I said not as competent as they ought to be. I said that these men while in that very responsible position cannot have too good a knowledge in cases of emergency—that is, if cases of emergency arise. The engine-keepers are not there to cause accidents, but to prevent them. I believe this is a thing the miners and officials know very little about—the very narrow shaves that take place.

27829. That shows that they must be equal to the emergency?—It does not show it entirely.

27830. I think it shows it conclusively. You say there are a great number of close shaves which they manage to escape. That shows they are equal to the emergencies?—The law ought to be that no men but those who are competent should fill these positions.

Digitized by Google

Mr. R Shirkie. 17 July, 1907.

27831. I am suggesting that the fact of having escaped these narrow shaves, which you say so frequently happen, and the fact that no fatal accidents occurred and only five non-fatal accidents, show that the men who are discharging this work are competent men?—It shows practically that that is so, but I say that even this proportion of accidents justifies the request.

27832. I want to go a little further. You support, I presume, the Bill that is presented from time to time to Parliament for the certificating of engine-winders?—Yes.

27833. It is one of your principles that no person who has not a certificate should be allowed to wind at all?—That is so.

27834. Have you the Rules of your Association with you?—Yes.

27835. Will you refer to the part with reference to the teaching of winders? What is your regulation as to that?—They get as a haulage member into the Association, then they pay £2 for instructions to wind, after they get the consent of the manager or owner of the colliery.

27836. Is there a regulation of your Association that the winding engine-man is to decide whom he teaches?—No.

27837. Is it a violation of the Rules of your Association if he teaches a person who is not a member of your Association?—Yes.

27838. In your Association the winding engineman is not allowed to teach a man who is not a member of your Association?—That is so, that is an apprentice. In our Association a winding engine-keeper is quite at liberty to show another winding engine-keeper anything regarding the machinery.

27839. Will you read the stipulation which prohibits a man teaching a person who is not a member of your Association?—That is so; I do not need to refer to it.

27840. Will you read it, to get it on the Notes?—This is 3, Admission of Members: "Any person desirous of becoming a member of this Association must be proposed and seconded by two members who must be satisfied of the applicant's qualifications to become a member before proposing him. Applicants will be qualified to be admitted as winding enginemen who have been performing duties for a period of three months. Applicants will be eligible to be admitted as haulage members of this Association who have been employed on pumping, haulage, locomotive, fan, electrical, or other machinery, for a period of three months. Applicant must produce a medical certificate of good health before he can be enrolled in the books for full benefits. Every member on entering this Association shall declare his adhesion to the principles and objects of the Rules, and shall support and advance the interests of this Association, and the objects thereof, so long as he continues a member."

27841. Will you go to the part about the limitation as to the persons who may be taught?—I do not know that there is any limitation put down as to the persons who may be taught. £5 they pay for the instructions.

27842. You told me just now that the winding engineman was the man, according to your Association, to decide whom he should teach?—The Association decides whom they teach.

27843. Supposing the manager of the mine took a person into the engine-house and said "I want this person taught," is he entitled to say "I will not teach him"?—We have had very little difficulty in that way.

27844. According to your Rules can he do so?—It all depends. If he wants to take him in in the proper way, according to the Rules of the Association.

27845. Can a manager say "This man must be taught"?—No.

27846. Why not?—Simply because it is a violation of the Coal Mines Act.

27847. It is not. Is it a part of your constitution that you would prevent a person being taught who was brought by the management, unless you approved of it?—Yes.

27848. Why is that?—Because it is the Rules of our Association.

27849. Supposing this certification came into operation, a man could not get his certificate unless he had been taught?—No. A man before he can get his certificate would have to be taught at the engine, and he could not be taught except your Association permitted him to be taught. Therefore your Association would control the persons who would be entitled to wind men up and down the pit. That would be the result?—I cannot say that follows. You might as well say a manager could not get a certificate except some of the rest of them taught him.

27851. Will you deal with the enginemen first? Would not that be the result? If your views were carried out your Association would decide as to the person who should wind people up and down the pit?—No, I do not think so; not entirely; it would to a certain extent.

27852. To what extent would it not? If you can prohibit a man being taught you can prohibit a man getting a certificate?—No. This man needs to have experience in connection with the work. He needs to be working about it and understand what an engine is, and boilers, and so on. It is not necessary that he must have been winding. With the experience he has in the time he has been there he can pass the examination.

27853. Do you think it would be safe to have a man get a certificate and qualify who had no experience at engine winding?—If that was a hard and fast rule, where would it end?

27854. I am asking you. I do not know where it will end. Do you think it would be a safe thing to give a man a certificate and authorise him to go to the Transvaal to get a place as a winding engineman if he had not actually wound?—I say it would. I say he has practical knowledge, he has experience, and he has a certificate which would enable him to call himself a fair engine-keeper. He only requires practical experience of winding.

27855. When is he to get that?—When he has had the other experience.

27856. After he has the certificate?—No, before he gets the certificate.

27857. You are going to prohibit people being taught winding?—No.

27858. You say a man cannot be taught in the engine-house unless your Association approves of it?—The men must approve of everything that happens in that direction. Someone must approve of them.

27859. I say the manager is the man to say who is to be taught?—My experience is that it is not so.

27860. It is not if you can prevent it?—If certificates had to be got it would be an easy matter in having arrangements made whereby men could be taught, and the Association have not all the say.

27861. If your Association are to prohibit people being taught it would be an easy matter for you, because you could limit the persons who are winding engines to the persons who had got certificates?—The Association is not all-powerful in that. Managers could teach any man they wish to teach. It is only a question of "Do not ask me to do it."

27862. Why should he not ask you to do it?—Surely I am to have a say in it.

27863. You are to be paid?—Am I to do anything, whether I believe it is right or wrong, simply because I am paid?

27864. Your view is that you should say who is to be taught?—I did not say so. To give a case, in Bathgate two members were approached by the manager: "Would they teach this man?" He was a friend of the manager, and wanted to learn. They said "We are willing to teach him, but he will have to come in the proper way that all the other apprentices come."

27865. What is that way?—He would have to come to the Association. I am only giving this case as matters stand. The manager said they would have to do it. I was asked to look into the matter, and I told the manager they would not do it except he came in the proper way. This was only a matter of winding to trample on the rights of the men.

27866. It comes to this: you claim your Association shall say who shall be taught?—That is not so. The manager said: "Have you to tell us who is to work the winding engine?" and I said "No." He said "Can I take that man and get him taught?" I said "Certainly you can, if you wish to; you can teach the man at any time," but if any man is on duty you cannot teach him.

27867. You do not teach when you are winding?—No. I said "When the engines are working we cannot interfere, but you can teach him."

27868. The manager could teach him?—Yes, or get anyone to.

27869. What do you do with a person who is a member of your Association who is going to be taught?—We get the consent of the manager.

Digitized by Google

27870. Having got that what do you do in the engine-house with him. Do you allow him to be with you ?—Yes.

27871. To teach him about the engine and show him how to wind ?—Yes.

27872. That is what you will not do to a person who is not approved by your Association ?—Certainly.

27873. Take the case you refer to in your notes where there is a dispute between the manager and his winding enginemen and these enginemen left. What was the dispute about ?—I do not know.

27874. However, they left ?—It was with the Association.

27875. Supposing that manager could not have got anybody to wind except with the sanction of your Association, what would he have done ?—That is supposing a case which really does not exist. This manager actually did settle up and the men got their grievances redressed after these accidents happened.

27876. If it is necessary for safety that the men should have certificates, that is one thing, but would not the result be, if no person was allowed to wind except men who had certificates, that they could compel any arrangement they thought fit, otherwise there could be no access to the mine ?—No, as circumstances obtain it would have the same effect as if certificates were granted. If we had that power you put forward, certificates would not help us in that power. If we have it we have it without certificates.

27877. It would help you in this way, there are many men not in your Association who can wind, but if a man is not allowed to wind without a certificate, and they could be only got by your Association teaching people, you would have all the people who could wind in your Association ?—We have mostly all in Scotland already, and if this state of matters was the case which you have pictured, it would be the case apart from certificates.

27878. In case it should be considered necessary for safety that there should be certificates, would you object to such restrictions in the Act to prevent such a thing happening ?—I would have no objection to that.

27879. (*Chairman.*) You mean a manager can now teach a man. You cannot prevent a manager teaching a man ?—No.

(*Mr. Ratcliffe Ellis.*) There is no use in a manager teaching him, he wants to be taught by a man who understands it.

27880. (*Chairman.*) If the manager could get him taught in any other way and the man was capable of passing the examination, he could get a certificate whether a member of your Association or not ?—Yes.

27881. However, you are prepared to go further than that and say that you would not object to an Act laying it down that you should not have exclusive control over this matter ?—I would not have any objection to a matter of this kind, not entirely confined to ourselves and submitted to arbitration or a Court of that kind. I do not think that is our object to get more power over this.

27882. (*Mr. Ratcliffe Ellis.*) At any rate, there should be some provision that in such a case access to the mines might be obtained by persons other than certificated enginemen. There are not more than 5,000 winding enginemen in the country ?—I do not follow your last statement.

27883. There are not more than 5,000 winding engine men in the country ?—The statement you made before that I mean.

27884. Supposing the time came when the pits could not be got access to because the certificated enginemen would not work, a provision might be made by the Home Office, that access should be got by uncertificated enginemen. One clause in the Bill is that no person who was not certificated should be authorised to wind ?—I do not think there would be much wisdom in going that length. You would place men on whether they had experience or not.

27885. It might be necessary ?—Of course, but that is very improbable.

27886. You would have no objection to having provision made ?—No, a provision of some kind.

27887. With reference to the time of the men at present engaged during the night when coal is not being wound, is there much for the engine-winder to do ?—Yes.

27888. What has he to do ?—During the night is the time when they repair the shafts. There are very few places, but there are two or three other engines to attend to. The packing of the engines has to be done during the night; the cleaning takes place during the night. We have had conferences with the coalowners of Scotland, and it has astonished me because they seem to think the man has nothing to do at night.

27889. There is nothing like the strain on him as there is during the day ?—At night, having so many other duties to attend to, I think there are more accidents than during the day when actual winding is going on. He is attending to other things during the night.

27890. Do you think there is the same strain in the night when there is no coal being wound as there is in the day when the engine is going full speed and winding coal the whole time ?—I believe there is more responsibility in this way. There are more men handled at night than during the day.

27891. You have been an engine-winder. Is there the same strain at night when coal is not being wound ?—Yes, as far as my own experience is concerned, there was a strain on me when I was winding men.

27892. Exactly ?—You handle more men during the night. There are so many more things to attend to, and it is men, men, men all through the night.

27893. You think there is such a strain on a man ?—Yes.

27894. You would not approve of having a longer shift in the night ?—No.

27895-6. Have you taken any note whether the accidents which occur happen in the later hours of the shift of the winding enginemen ?—No; my opinion is that they do happen later in the shift, but I have not taken any note of it.

27897. You say after the hours you had to wind you felt too done up to be quite at your best ?—Yes, I have no hesitation in saying that.

27898. Can you fix any time that should be the time. You think 12 hours is too long ?—Yes.

27899. What do you think should be the time ?—I think it should be eight hours, three men on each colliery.

27900. Why this mention about eight hours ?—It is because there is no other practical way with colliery engine keeping. It requires men to fill in the whole time, therefore two are too little, and to divide it into three it requires eight hours.

27901. Is there no difference in the engine ? Would you not make a difference where there is a big engine and a large output and where there is a small engine and a small output ?—I do not think you can. You cannot do it so far as care and responsibility are concerned. Where you have a large output you have a large engine and you bring up so many more hutches at the time and the engine is generally slower. It has a larger drum and the engine goes slow. Where there is a small output and small plant, as a rule, you get the enginemen more taxed at that small place than the large place.

27902. In your view there is no difference in strain whether a big place or a small place ?—That is generally my view.

27903. You wanted to mention in connection with certificates for winding enginemen, certificates for colliery managers. You look upon them as on the same line ?—Yes.

27904. Do you know any association of colliery managers which prohibits a man being taught his business ?—I do not know any just now, but I suppose there to be one.

27905. You have not found any lack of certificates ?—So far as prohibiting is concerned, I do not think there is any difference between the certificates for winding, or what should be for winding, and for the manager.

27906. You know now, and we have heard before the Commission that there are a great many men with first-class certificates working at the face ?—I believe that.

27907. There is no limitation as to the persons who may be taught there ?—There are a great many winding engine-keepers working at the face who have no certificates.

27908. Are they competent men ?—Yes, a great many are competent men.

27909. In an emergency they could be got to wind ?—Yes; I believe there are very few districts but where there are two or three dozen men working at the face.

27910. That is all right now, but if the law was passed prohibiting the winding of men except by certificated enginemen it might be very mischievous ?—If this law

Digitized by Google

Mr. R. Shirkie. 17 July, 1907.

was passed, and it was seen that a great mistake had been made, surely they would be equal to the emergency and pass another law.

27911. It is safer not to pass this law?—It is easy to put in difficulties, but at the same time I do not know that there will ever be a limit so far as law-making is concerned.

27912-3. Will you give the name of this colliery where this manager was left without winding enginemen?—Wallyford Colliery, in Midlothian.

27914. (*Mr. Smillie.*) Is there any real dearth of engine-winders in Scotland at the present time? Have mine managers any difficulty in getting an engine-winder at the present time?—Not that I know of.

27915. Does your Association desire to limit by this certificate the number of winders?—No.

27916. Is that your aim, or is it safety?—Safety.

27917. We want to be clear on this; there is a feeling that you are aiming to get hold of the mines of the country?—No.

27918. Is it really for the safety and well-being of the engine-winders that you desire a certificate?—Yes.

27919. In the event of it being passed into law that a certificate of competency must be held, would you object to engines being used in different parts of the country for training men in different parts of the country for that purpose?—No.

(*Mr. Ratcliffe Ellis.*) Will you have pits, too?

27920. (*Mr. Smillie.*) Yes, at any of your present collieries. I am asking, would your Association object to a system of training engine-winders at any of the existing pits outside them altogether? I want to know if they object to the making of enginemen. We do not want to assist them in that direction. At the present time your rules have been drawn up in order to secure competent men?—That is so.

27921. Had there been a law providing for certificates of competency, those rules would not be necessary?—No.

27922. I mean the safeguards put into the rules. Have engine winders' rules tended to secure competent men?—Yes.

27923. No attempt was made by anybody outside the men to do that?—That is so.

27924. Would you accept a person members felt was not a competent engine-winder?—No, we have that in our rules.

27925. That is the reason for this being in your rules?—Yes.

27926. The Scottish winders, so far as you know, are quite as capable winders as in other parts of the country?—Yes, we get that verdict from those who are in a position to know them all.

27927. To a great extent you think it has been the provision of your rules which made those men competent?—I am certain of that. I have no doubt, personally.

27928. At one time there was a considerable number of engine-winders known as tramp winders. Are there still some?—There are some, but they are a diminishing quantity.

27929. That is men who are not steady men, and shifted from place to place?—Yes.

27930. Those men were often engaged without much enquiry as to their competency?—That is so; they served just for the time being.

27931. In addition to the accidents you mentioned, you remember a considerably larger number than you have dealt with here? Do you remember the accident which took place at Swinhill Colliery through incompetent engine-winders?—Yes.

27932. That was a case in which the winders were on strike?—Yes.

27933. An incompetent winder who had never wound before was employed without enquiry?—Yes.

27934. That came out at the enquiry?—Yes, the cases I have given do not exhaust the cases. It was a recent occurrence.

27935. Have you known a manager held responsible in the law courts for engaging an incompetent engine-winder?—No.

27936. If an accident arises from an engine-winder being incompetent, is not the engine-winder himself held responsible?—He is fined.

27937. Not the manager?—*No.*

27938. What are the wages of the engine-winder in Scotland?—5s. 7d. per shift, just now 5s. 8½d. with this last rise.

27939. That is seven days a week?—Yes.

27940. (*Mr. Enoch Edwards.*) How many hours per day?—Twelve hours.

27941. (*Mr. Smillie.*) You do not consider that is a wage that is likely to encourage the very best class of men?—That is not. That is the reason so many men are at the face.

27942. You have a considerable number of skilled competent enginemen working in the face at the present time?—A considerable number.

27943. Earning considerably higher wages than they can at their employment?—That is what makes them leave the engines, the long hours and the small pay.

27944. Are there any of the collieries in Scotland at which the hours of the engine-winders are only eight hours per day?—I think there will be three pits: but this is the thing; that is given, but not recognised from head-quarters; the managers have arrived at the conclusion it suits them better to have this.

27945. This strain on engine-winders has increased very largely?—Yes, and is still increasing.

27946. At some of the collieries the engine-winder, from the time he starts work till he finishes, scarcely ever leaves the handle of his engine?—That is so.

27947. There is not a moment that his mind is not strained?—That is so. In a good many collieries they wind two shifts.

27948. Some of your collieries have two or three landing places in the shaft?—Yes, the majority of them have different bottoms.

27949. Where they are working out seams?—Yes.

27950. There is a different bell in the engine-house for each of those bottoms?—Yes.

27951. The engine-winder not only requires to pay attention to winding, but also four different signal bells from four different bottoms?—That is so.

27952. From the mid-bottoms he must also pay attention to the signal which indicates that the gate is closed or open?—That is so. That is a part of the duty he is bound to do. I have known two cases where engine-keepers were fined for that indicator being out of order and not reporting it, not seeing the gate working properly.

27953. Do you know if there are many engines which have the Vizer apparatus for stopping the engine in the event of the man neglecting to do so?—I do not know of any.

27954. Do you know Douglas Water Collieries?—No; I have been in the district, but I have not been in the collieries.

27955. Do you know the Vizer apparatus?—No.

27956. From your experience as an engine-winder you tell us on many occasions that you yourself have been almost on the verge of causing accidents. Would you agree if there is an apparatus that will stop an engine before the cage went to the pulley, shut off the steam and stop the pulley, that it should be attached to all engines?—It seems to me a difficult matter. Supposing a cage is coming up and steam is shut off, unless there was an apparatus to apply a brake ——?

27957. You do not know the apparatus?—No.

27958. If it was proved that there is an apparatus to shut off steam and apply a brake and prevent overwinding or underwinding, knocking the cage to the bottom, should it be attached to an engine?—Yes, certainly.

27959. With regard to the Fatal Accident Inquiry Act, I am concerned a bit about that. You have full power to ask all necessary questions?—Yes.

27960. Have you power also to call witnesses?—Yes.

27961. Have you ever done so?—Yes, on one or two occasions we nave had witnesses. I do not understand what you mean. The witnesses connected with the actual accident or witnesses connected with the arrangements of the working of these plants?

27962. Any witnesses you have that would be useful in bringing out clearly the cause of the accident?—I do not know whether we have that power or not.

27963. The custom at the present time is that the Procurator Fiscal is responsible for calling all the witnesses,

Digitized by Google

and he may not call certain witnesses you might think were necessary in order to give information ?—Yes. Not only so, but in many cases the most important witnesses in that direction have been omitted.

27964. If you had known you yourself could have called them ?—Certainly.

27965. You get no information as to who is being called ?—No.

27966. You often find in Court the witnesses who could really throw the most light on the matter have not been called at all ?—That is so.

27967. You are entitled to address the jury and ask them to add something to their verdict ?—Yes.

27968. Did you do so in this case ?—No. That is the Holdsworth case.

27969. I do not think any law can force the jury. This law empowers them and instructs them that they are not only to find a verdict that an accident has taken place, and where, but to deal with the cause ; I mean the Act as now amended ?—I have not seen it done. It may be the case.

27970. You are aware under the previous Act the Sheriffs in many cases tell them they had nothing to do with the cause ?—Yes.

27971. But the Act is now amended, and puts the onus on the jury to deal with the cause where anyone is to blame ?—I understand that is so.

27972. You object that the jury do not do it ; they merely return a formal verdict. You could not suggest further powers than we have at the present time ?—I think the powers are very good. My experience, at any rate, is that juries are often made up of men who cannot understand the working of these things. I find a great difficulty in these cases to get any of them to understand the real working of collieries or the machinery of the collieries.

27973. Your experience is that seldom is a miner or an engine-winder called on the jury of any of these Fatal Accident Enquiries to enquire into those accidents ?—I do not ever remember a miner or an engine-winder being called on juries.

27974. I do not know whether you are clear on this point or not, but Mr. Ellis put it to you would you object to some provision being made in the event of engine-winders having disputes, that Parliament or the Home Office, or some other body, should have the power to put on non-certificated winders for the time being ? Did you mean that you were willing that should be done ?—I did not say I was willing that should be done. I do not see how that could be done to be consistent with the reason. I said I would have no objection to some provision to be made binding on both parties.

27975. Did you mean you would have no objection to the training ?—Yes.

27976. You never intended to convey you were willing that non-certificated men —— ?—No, I do not think I said anything to lead you to believe that.

27977. You will find, when you get the notes, you did say that, although I do not think you meant it in that way ?—If the notes are taken properly, this note will be taken, that I never meant anything of the kind.

27978. (*Mr. Ratcliffe Ellis.*) That is to say, under no circumstances must there be any provision made that other than a certificated man must wind at an engine?—That is a different mattter than the way you put it before. That was in the event of a dispute calling uncertificated men—under no circumstances. An accident might occur, the engine keeper might himself meet with an accident.

27979. There might be a dispute, the pit might be destroyed in consequence of people not being able to wind men up and down and look after the pumps ; the place might be destroyed, and unless there is some provision by which an owner can get access to his mine he would be absolutely in the hands of the certificated enginemen ?—The owner has always access to his mine. I do not see that we take any unreasonable stand. If, as Mr. Smillie put it, uncertificated men would be called, I think the whole thing would be a sham. There would be no use for certificates at all.

27980. (*Chairman*). Except in cases of emergency ?—Yes, that is so.

27981. If the engineman suddenly fell ill, and it was necessary, the men should be taken up at once ?—That is so.

(*Mr. Smillie*). You do not object to a provision being made in a case of that kind ?

27982. (*Chairman.*) You would personally not object, whatever your Association might say, to an Act of Parliament providing in the first case in clear cases of accident or emergency, that anyone capable of working the engine should work it, and probably to some other further provision to prevent the flooding of the mine, or serious damage being done to the pits resulting from a strike ?—We would have no objection to provisions to be made so that we should not have complete control, that we should be bound by as well as the owners.

27983. (*Mr. Ratcliffe Ellis.*) That you should have no control ?—No control over our own labour.

27984. Yes, but I say you should not control other people's labour ?—We do not wish to do it. If they want us to teach men we have to do it.

27985. (*Mr. Smillie.*) You do not want to control the engine or the engine house, except when you or your members work the engines ?—That is so. We have nothing to do with controlling the engines.

27986. You object to the manager telling you that you must teach this person ?—Yes ; we look upon it as an abuse, and often used in a way that is not conducive to fairplay at all between the employer and the employed.

27987. What proportion of managers are capable of winding ? There must be a considerable number ?—I believe of those I have come across there will be about 20 per cent.

27988. Capable of teaching winding ?

(*Mr. Ratcliffe Ellis.*) The manager would not be allowed to wind.

(*Mr. Smillie.*) Unless he had a certificate.

(*Witness.*) Suppose the certificate came into operation to-morrow. I do not suppose a man would not be allowed to do what he wished with his plant, so long as there were no men in the mine.

27989. (*Chairman.*) He can go down himself ?—It is a question of life ; it is not a question of plant.

(*Mr. Ratcliffe Ellis.*) The Bill says that persons are not to be put down or raised up except by certificated men. If there was such a law in the interests of the safety of the property there should be some restriction upon that law in the case of emergency. You agree with that. I say that emergency should extend to cases where enginewinders and colliery managers have a dispute, and where the certificated men would not wind he should be able to get somebody else to wind.

(*Mr. Smillie.*) The witness objects to that.

27990. (*Chairman.*) There would have to be some exceptions ?—How can we do anything else except object on the ground of unreasonableness ?

27991. (*Mr. Smillie.*) There is an examination every 24 hours of part of the machinery ?—Yes.

27992. Can you give any information as to how that examination is made ?—If I express my opinions—I suppose I may ?

27993. Yes ?—I believe it is pretty nearly a sham altogether, because those winding engine-keepers that have to make these examinations have no time to make them in the general run of cases. They have to report upon the boilers and the headgear, and all these things. In many cases, in fact the majority of cases, they cannot do anything but run round about them, and in many cases they do not even get a time to run round about them. I have some cases here sent by members complaining of that. There is one in Harthill district, where the engineman said he could not examine, and reported defects. The engine-keepers, I believe, ought to be cleared from this. A competent man ought to take this in hand, because many engine-keepers get victimised when reporting defective machinery. They are told if they cannot work with it others can. That is putting in the Report Book.

27994. If they put in the Report Book that there is something wrong, and they want it put right, they are told if they cannot work somebody else will do it ?—In many cases that is so.

27995. Have you ever had complaints from your members that they were not supplied with the wherewithal to keep their engines in a proper state, such as packing ?—Yes, many a time.

27996. That handicaps the engine-winder, too ?—Yes. It is quite a common thing to look for packing in other places.

Digitized by Google

Mr. R. Shirkie.
17 July, 1907

27997. How is the examination of ropes, sides and shaft made? Is it a thorough examination as you understand it is made to-day?—I believe in some cases it is thoroughly done.

27998. Is there any place you feel it is not thoroughly done?—I believe in the majority of cases it is not done at all.

27999. The engine-winder's only knowledge of that is that he is lowering the men who do it?—Yes.

28000. The rate at which he lowers them makes an examination impossible?—Yes.

28001. Accidents may arise because of the want of that examination being made?—Yes. I have known cases where the rope was supposed to be examined every day. I know one case in Blantyre when the rope was thoroughly examined there were broken wires all over the rope. It had been going on, but it was never examined.

28002. That is a breach of the Act?—Yes. This Report Book is a breach of the Act, too, but this is only to show that it is not looked into so carefully as it ought to be.

28003. There are a considerable number of mine owners and managers in Scotland who are particularly anxious and do their very best to carry out in its entirety the Coal Mines Regulation Act. The complaint is that it is only at some collieries where carelessness exists. Generally the management are anxious to carry out the provisions of the Act with regard to safety?—I believe, in justice to them, there are many of them anxious to keep things straight and safe. I do not know that I can say the majority.

28004. A considerable number?—Yes.

28005. You do not complain of all mine managers?—No.

28006. (*Mr. F. L. Davis.*) Do you seriously say the owners or managers are so blind to their own interests that they do not supply the enginemen with proper cleaning materials or packing?—I say that is so in some cases, but it is not in the majority of cases. It is actually the case in collieries that they do not supply them even with waste to clean the engines.

28007. When the man complains that his engine wants looking to, he is told if he cannot work it somebody else can?—That is so in some cases, but I do not say that is in the majority of cases. I say it is possible at the present time, and is done at the present time. I have a case of a man who was victimised at South Rigg in this district, that is Harthill district, some years ago, for reporting a defect of machinery in the book.

28008. Is it 20 years ago?—It cannot be anything like 20, because the man who writes is not much over 20, and he remembers it. He was victimised, that means dismissed, for reporting this defect of machinery, and wanted to make something out of it. He approached the mines inspector, whose attention was drawn to the matter, and all the satisfaction our member got from him was that probably a solicitor would take up the case. He was victimised, and at many of the collieries round about he could not get a position. That man had to leave the district because he reported a thing that was actually the case. I have numerous letters here. Not very long ago I had a letter from one who had attended winding engines, and the engine-house was not very well covered. He had put the brake down, but the cage was at a seam in mid shaft, and some men got on while he was attending to the winding engine, and the brake was defective, and the engine went away and caused a little accident. That man was dismissed, and he had over and over again reported that as being the case, that the brake could not hold the cage when there was a load on.

28009. That seems extraordinary. I should have thought in both cases there must have been something else we do not know of, because it seems to me against the interest of the owner and the manager?—It does, but at the same time you find many strange things you are not able to account for.

28010. You say you have no objection to the manager teaching anybody he likes winding. Do you see any difficulty in his doing that? Supposing the manager has a certificate, and certificates are compulsory, is there any difficulty in doing that?—No, I cannot see any difficulty.

28011. It would be difficult to teach them when the colliery is in full work?—Yes. There is a day every week when there is no work at the colliery. At night there are many pits where there are no men down the mine.

28012. If the manager took charge of his winding engine, the man whose proper shift it was would be deprived of his work?—No; there are a great many shifts where there is only one man during the day.

28013. You are trying to arrange for an 8-hours' shift for three men, 24 hours for each engine?—That is where the pit is double-shifted. We could not ask to put three men on where only one is required at present. The pit is single shifted. We know single-shifted pits, that work during the day and do not require men during the night, and there is no engine-keeper there during the night. We could not have three men in a case of that kind.

28014. The great majority of your pits in Scotland, I take it, have a lot of work at night?—That is so; the great majority have.

28015. You do not think there would be any difficulty about the manager saying "I want the engine-house to teach somebody," and the man whose ordinary shift it would be would be told that he was not wanted. He would be a shift short in that week?—I think that is rather a far-fetched thing, because at most of the collieries there are pits single-shifted.

(*Mr. Ratcliffe Ellis.*) This is a repairing shift.

(*Mr. F. L. Davis.*) There are not collieries in our district in that position.

28016. At any rate if the manager wanted to teach the man, he does not require to ask the engine-keeper, supposing he is on duty, to allow him to do it. The manager has only to put the man out of the mine and he can use the engine as he likes.

28017. Your certificated engineman is not going to help the manager, therefore, the manager has to do it when the engineman is not there?—No, not necessarily, he can do it when he is there if the Mines Act is kept, that is, no men in the mine.

28018. It all depends on the feeling of the particular engineman at the time, as to whether he will help the manager. It is only if he thinks it is all right that he will help to teach this man. If he does not want to he says, "I will not." However, I do not want to take up time over that. I want to emphasise the position Mr. Ellis put to you. If you have these certificates and nobody is allowed to wind without one it must follow that these 5,000 winding enginemen in this country have the control of the whole coal trade of the country?—Would you say from that that the mine managers at the present time have control of the whole coal trade, I mean those who must have certificates. You say they have control, but supposing they had an Association——

28019. They have not?—I expect they will soon have one.

28020. Yes, but they have not one?—I can assure you they are going to have one—will they have full control over the coal trade?

28021-2. They are in a totally different position. Take my manager, for instance, if I say I want you to take so and so as a pupil he has to do it, and if he does not I get rid of the manager?—Do you say in Canada, South Australia and South Africa that these engine keepers have full control over the trade where they work? What is the difference at home?

28023. If every man must belong to your Association who has a certificate, and no man is allowed to wind unless he has a certificate, and, therefore, belongs to your Association, it follows that you have the control of the whole of the access to all the mines in this country. You cannot get away from it, surely?—I do not think anything of the kind follows. You must say the same thing is the case at the present time. If we wished at the present time to make the whole of the coal mines idle——

28024. (*Mr. Ratcliffe Ellis.*) These men at the face are not in your Association?—We are not afraid of these men. You might as well say that the same argument holds good at the present time, that we hold the whole thing in our power. I think that is not the case, and I do not think it would be the case.

(*Mr. F. L. Davis.*) That is your opinion. My opinion is it would be. It would be if you wished it to be.

28025. (*Chairman.*) What happens in South Africa. Who has control over the men who are allowed to be apprenticed?—It works very well. If the manager asks anyone he wishes to learn he learns.

28026. The manager has the power to say that a certain man has to be taught and he is taught?—Whether he has

Digitized by Google

the full power or not I do not know, if it went to a question of power, but it works very well in that way. When the manager asks certain men to be taught they just learn for the manager.

28027. That is to say, the management and not the Association, whatever it is called in South Africa, has control over the apprentice ?—They have not control.

28028. I mean in this way, the management can insist practically upon a certain man being taught this engine-winding ?—Not that I am aware of. The Association is, practically, the same as the Association at home.

28029. In point of fact they work very amicably with the manager, and, hitherto, there has been no difficulty in a manager getting anybody taught ?—That is what I wanted to say.

28030. (*Mr. F. L. Davis.*) You have told us you object to having another engine-winder winding in the house a second engine which the winding engineman has to attend to ?—Yes.

28031. That applies only to the winding engine ?—Only to the winding engine.

28032. There is no objection to having a fan engine, or a small electric pump engine, or an electric-light engine in the same building as long as there is not a winding engine too ?—No, it only applies to winding engines.

28033. (*Mr. Enoch Edwards.*) There is a paragraph in your statement: "A mine manager can employ any man from the street as a colliery engineman. In many cases, persons absolutely incompetent." How long is it since that was a practice in Scotland ?—There is nothing to hinder it being done to-day.

28034. How long is it since it was practised in Scotland ? Your Union exists to prevent it happening. How long is it since it happened ?—Supposing that the Union exists, I do not know that it is able to prevent it. There are some collieries where they have only one pit and two men can supply the engine there, and apart from any trouble with the Union they can employ men where they like.

28035. There would be men who are not members of your Union ?—Yes.

28036. Your Union is not complete in Scotland ?—There would be at least five per cent. not in the Association. It is more complete now than it used to be. I am speaking of the past. That can be done yet.

28037. The case you gave of some years ago would be a case that happened before you had a Union ?—Yes.

28038. The cases you brought here would be cases before your Society existed ?—What cases do you refer to ?

28039. You told us that a man was victimised ?—No, we had a Union at that time.

28040. Was the Union unable to interfere ?—They could only interfere by supporting him financially, but they looked into the matter. I was not on the Council at the time, but I know they looked into it, and they came to the decision that he was victimised.

28041. That was before your Union was very strong ?—It was not so strong.

28042. I understood you said the man was not discharged for incompetency but for disobedience. He reported something; he disobeyed the officials or offended them ?—He offended them by reporting defective machinery.

28043. I must confess, with my knowledge of colliery owners, that that is not in harmony with my view of a colliery, that if an engineman reported a defect he would be discharged ?—I do not say that is the general thing. I say that has been done and it could be done yet.

28044. Is it not the business of the engine-winder if there is any defect, to report it ?—Yes.

28045. Would he not be neglecting his business if he did not report it ?—Yes, in Scotland, at any rate, the engine-keepers do not get proper examining.

28046. They get the same examinations everywhere ?—Yes.

28047. This is rather a serious statement you make. It is the business of the engine-winder, if there is anything wrong with the machinery, to report it in England and in Scotland. You say, for reporting it they discharge them in Scotland ?—No, I did not make a general statement of that kind.

28048. We will take what you did say. You gave a case of a man who was discharged from his colliery because he reported defective machinery ?—Yes.

28049. So that in Scotland it is possible ?—Yes, I expect it would be possible in England, too. That case I gave really happened. I was sent this letter regarding this case and there is no doubt about it being the case. The mines inspector told him that possibly a lawyer or a solicitor would take it up.

28050. Your Society did not take it up ?—To the extent that they supported financially the victimised member. That is all that they could do.

28051. You did not report that to the Home Office ?—I do not know what was done.

28052. Whatever law we have it will be the business of the people engaged in it to see that it is carried out ?—Yes.

28053. This, rather, would be a violation ?—Yes.

28054. You could not say whether it was brought to the notice of the Home Office ?—You mean if that was brought to the notice of the Inspector of Mines ?

28055. This case is not within your knowledge ?—No.

28056. Do you think it would happen while you are secretary of the Association and that it would rest where it does ?—No.

28057. In regard to members entertaining your Society, you give certificates of good health ?—Yes.

28058. Is that rather to guard the Society for the purpose of other funds like a friendly society ?—It is the provident side.

28059. It is not a question of fitness as to his position, whether his eyesight would be good, for instance. There is no test of eyesight ?—I know two or three cases where men have not been allowed to enter the winding class because of defective eyesight.

28060. Now he could not be an engine-winder unless sound in health ?—That is so. That is the case, and that is certainly done with a view to the funds. A man must be a competent person to be an engine-winder before admitted to be one in every way.

28061. I suppose all the men who are competent have had to learn and make themselves competent. There would have to be a period of training for all the members of your Society to gain that competency ?—Certainly, they are generally in touch with the machinery and so on, and a great many of them have been winding engines apart from the Society altogether.

28062. I want to see if I follow what has largely taken up the time here this morning. The term manager has been used very often. Are there not engineers about all these collieries ?—Yes, mostly.

28063. Is the chief man responsible—not the colliery manager, but the engineer of the colliery—I mean responsible for all the machinery ?—Yes.

28064. He would know how to work the engine ?—Most of them know how to work an engine.

28065. There is nothing to prevent the engineer who understands the machinery training the enginemen ?—In most cases I believe engineers are winding engine-keepers.

28066. I will assume a man who wns a certificate as a manager understands his business, and that an engineer of a colliery would know something about winding engines ?—Yes.

28067. You assume he would ?—Yes, and they do.

28068. He would be quite a competent person to teach anybody to wind ?—Yes.

28069. He could teach him and he would have that degree of competency that he could take his certificate ?—Yes.

28070. That rather shifts the ground taken up here ?—Certainly it does, and that is the case.

28071. He could train them ?—Yes.

28072. Supposing you said we are not going to teach this man, there could be nothing to prevent the engineer of the colliery teaching as many men as he liked ?—No.

28073. Nobody could prevent them being so taught and receiving their certificate ?—I do not think that the granting of certificates would give any power to the engine-keepers more than they have just because of these things you mention.

28074. Now they do not severely exercise their power. They work 12 hours for 5s. 8d. They do not exercise very great power and claim a great share of the world's wealth ?—I do not think so.

Digitized by Google

Mr. R. Shirkie.

17 July, 1907.

28075. I think it rather surprised Mr. Ellis, that 5s. 8d. ?—The first winding engine I went to, the manager taught me the winding of the engine.

28076. What did you mean by saying there are more men handled in the night ?—Instead of there being two 12-hour shifts, by arrangement between the engineman they make one 10 and the other 14 ?—Yes.

28077. That is the enginemen's own arrangement ?—Yes.

28078. They could arrange otherwise if they liked ?—Yes.

28079. They could so arrange that it would not be necessary for one man to handle all the men ?—It would not make any difference as far as the handling was concerned. There are more men handled in the night, because during the day we are winding coal, and there are restrictions for men going up and down the shaft.

28080. I have some experience, but not of Scottish mines; but mines in England. Take a pit where you employ underground 1,000 men. Those are let down by the engineman and drawn up at half-past two ?—Yes.

28081. In the next shift there are very few people. There may be a few labourers going up and down, but a very small number ?—They are one hour or one and a-half hours letting down the men, but I mean the men running up and down during the night.

28082. You do not mean the quantity ?—No. I mean there is more handling of men.

28083. You put it more men handled, but you mean running the cage oftener ?—Yes. It may be the same men handled five or six times.

28084. You said 90 per cent. of these men were in your Union ?—Yes.

28085. Further, that there is a large number of men working at the coal face. There may be no objection to these men at the coal face having certificates ?—They can go in for the certificate.

28086. You would have a competitive examination ?

28087. (*Mr. Ratcliffe Ellis.*) They would get a service certificate ?—Service certificates are generally confined to men working at the trade at the time. I was in South Africa when they came out.

28088. (*Mr. Enoch Edwards.*) We need not go as far as South Africa. Certificates for colliery managers in this country when first made compulsory were given to the first managers for the service, and they are all given for service ?—That is so.

28089. You do not suggest that supposing this law was passed they should be given to the first batch other than for service ? Do you see how they could get over the difficulty ?—I do not see how they could get over the difficulty, to start with, except it was given for service.

28090. It would depend upon what is to be the chief grounds of examination, and what are to be the facts considered. There are many engine-winders sufficiently intelligent to understand how you wind an engine, who would not pass except the crudest form of examination, who are good engine-winders—I mean among the older men who wind engines ?—I believe so; but I think it is conducive to the better performance of duties if a man has a thorough grasp of all that is connected with his duties. There is great incentive to that at the present time. When they go to the winding they do not trouble in many cases. I knew in South Africa an engineman who had been 20 years winding, and he failed. He knew how the steam got into the cylinder, but he could not tell them how it got out.

28091. I believe we have many men with first-class certificates managing collieries who could not get through now by a long way ?—Yes.

28092. I know cases where they would not, and I believe it is so with regard to the engineman. You said wages were 5s. 8½d. for 12 hours ?—Yes.

28093. Is that general over Scotland ?—There are a few exceptions where they work a 10-hours' shift, but they are very few.

28094. The wages are 68½ per cent. higher ?—Yes.

28095. What was the wage before the advance in Scotland ?—5s. 2d.

28096. They do not fluctuate ?—Yes. When the miners are under 6s. a day the engine-keepers only rise or fall by one-third; when above 6s. a day, they only rise or fall by one-half.

28097. The miners would take their day wage down to 4s. ?—It was possible.

28098. Yours was 5s. 2d., and not less ?—At that time ?

28099. Yes ?—No, about 3s. 2d.

28100. That is what I am putting to you. When the collier's wages in Scotland was 4s., what was the wage of the enginemen ?—About 3s. 2d.

28101. For 12 hours ?—Yes. There was nothing else but 12 hours at that time.

28102–11. It would look interesting on the Notes, 3s. 2d. a day for 12 hours' work in 1888 in Scotland ?—I think we are safe in saying that.

28112. (*Chairman.*) In cases of emergency in South Africa what do they do ? Has there been any difficulty to get the engine worked by a certificated man ?—Not that I am aware of.

28113. As far as you know there has not been any occasion to call in an uncertificated man to work the engine ?—As far as I am aware there has been no difficulty.

28114. With regard to health, you say in your own interests, being a provident society, that you insist on certificates of health when a man enters. A man may go a great number of years as an engine-winder and may develop some illness that a doctor may be able to diagnose which would probably end his life suddenly. Do you think that the men would object to being periodically examined with a view to finding out whether their lives were safe ?—I think they ought to be medically examined.

28115. Any man's life the doctor said was precarious and who was liable from the nature of his disease to die suddenly, ought not to be allowed to go on as an engine-winder ?—I think he ought not to.

28116. (*Mr. Smillie.*) Is that the opinion of your members ?—Yes. I remember one case just about six months ago; an engine-keeper in Lanarkshire was letting down the firemen in the morning; there were two cages of firemen, and he let down the cage, and the next men who went on to the cage had come up, and they signalled for him to lower, and there was no answer. They went down into the engine-house and he was lying dead at the levers. That was heart disease; but if that had taken place when these men were going down it would have been the death of the other men. It was just when he landed the men he dropped dead. In that case I think it would be necessary.

FORTY-FIRST DAY.

Wednesday, 6th November, 1907.

PRESENT:

Lord MONKSWELL (*Chairman*).

H. H. S. CUNYNGHAME, Esq., C.B.
WM. ABRAHAM, Esq., M.P. (Rhondda).
THOMAS RATCLIFFE ELLIS, Esq.
ROBERT SMILLIE, Esq.
S. W. HARRIS, Esq. (*Secretary*).

Mr. SAMUEL WRIGHT ROWARTH, called and examined.

Mr. S. W. Rowarth.
6 Nov., 1907.

28117. (*Chairman.*) You are the General Secretary of the Derbyshire and Nottinghamshire Enginemen's and Firemen's Union?—Yes.

28118. Previous to holding that position you were a winding-engineman in both the above counties?—Yes.

28119. I understand your Union is not a Union only of enginemen, but of firemen also?—Yes.

28120. But to-day you speak solely as to the enginemen, I understand; you do not wish to toll us anything about the question as to the firemen, I suppose?—No, but we do take all classes of enginemen and firemen in as members of our Association.

28121. (*Mr. Ratcliffe Ellis.*) And locomotive drivers also?—Yes, locomotive drivers about mines.

28122. (*Chairman.*) You mean firemen attached to boilers—stokers, and so on?—Yes.

28123. You are a member of the Executive of the National Federation of Enginemen and Boilermen's Association of Great Britain?—Yes.

28124. You were in favour of the Steam Engines (Persons in Charge) Bill, and you gave evidence in favour of it in July, 1901, before the Select Committee?—That is so.

28125. Your Association of the Derbyshire and Nottinghamshire Enginemen's and Firemen's Union embraces nearly all the mines in those two Counties?—Yes.

28126. You say that a great many of your winders complain as to the fatigue they experience of being on duty of such a very responsible nature for so many hours?—Yes.

28127. And you trust to see a legal eight-hours' day established for all winding-enginemen?—That is so.

28128. So that your evidence may be divided into two parts: first of all, with regard to the excessive hours which you maintain are worked by these enginemen and winders, and secondly, as to the precautions that have been taken for safety in winding?—Yes.

28129. To some extent, no doubt, the two questions are mixed up together, inasmuch as your contention, I suppose, naturally would be that a man who works more than eight hours a day would not be so likely to give his whole attention to his work as if he only worked shorter hours?—That is so; the men get fatigued. The coal-owners in the two Counties have recognised to a great extent the advisability of shortening the working hours of winding-enginemen; indeed, at a good many collieries an eight-hours' day is already in operation. In other instances the coal-owners have put three men on in the 24 hours, one man going on at six o'clock in the morning and remaining till four in the afternoon, which is 10 hours, and then going home; another man goes on at eight o'clock in the morning, takes charge for a couple of hours or an hour as they may agree, and they work alternately an hour or a couple of hours as they can arrange. Then the man who went on at eight o'clock in the morning stays till six o'clock in the evening, and then the other man, the third man, goes on at six and stays till six the next morning. But we have many complaints; these men just at the last hour may have hundreds of men to lower down into the mine, and they contend that a legal eight-hours' day—three shifts of eight hours each instead of two of 10 hours and one of 12 hours—would be much better; indeed, they find that they are practically exhausted; of course, they are not winding during all the night shift, the 12 hours; but they are exhausted, and they contend for the advisability of our having an eight-hours' day established by law.

28130. I understand that where you have two shifts of 10 hours and one of 14 hours, the men take it in turns to go on the 14-hours' shift or on one of the 10-hour shifts?—Yes—they work it round.

28131. So that no man is compelled to go on the 14 hours' shift for any length of time?—In some cases they are; the men are there from seven o'clock in the morning till five o'clock at night, and the man is then on 14 hours every other week where there are two men.

28132. Every other week how many days does he have of 14 hours?—He has one week at 10 hours and then a week at 14 hours.

28133. Does he have a whole week at 14 hours?—Yes.

28134. Then during what part of that 14 hours would he be employed in winding; how much winding goes on during those particular days that he is employed for 14 hours?—Different conditions exist at different collieries. Just now they are very busy, as you are aware, the coal-trade being sowewhat brisk, and they are winding during a good portion of the night duty.

28135. So that it depends upon the course of trade; sometimes during the long shift of 14 hours they are pretty continuously employed, and sometimes they would have a certain amount of leisure?—Yes.

28136. What amount of leisure do you suppose they would have under ordinary circumstances; what would be the longest time that they would enjoy leisure during this shift of 14 hours?—Would they ever be a couple of hours without doing any duty?—No; and no one is allowed in the engine-room except themselves—they are cleaning or they are packing in those intervals.

28137. They are doing something?—Yes, such as filling the lubricators, &c.

28138. There is no man allowed in the engine-room except that one man, is there?—No one except the one man.

28139-40. He is on duty for 14 hours?—Yes, for 14 hours. The man on the day shift is constantly employed and has scarcely time to get his meals, or indeed to answer the calls of nature without some bother being made, because in many cases we have not even the sanitary requirements in the engine-room, and the man has to leave the engine-room and go away. We have a fan engine-man at Grassmoor who left the engine-room to

Digitized by Google

Mr. S. W. Rowarth.

6 Nov., 1907.

answer the calls of nature, and he either had to be fined £1 or be dismissed. Of course, the man should have left someone in charge of his engine, but he did not do so. I simply mention this case as an illustration.

28141. How can a man manage if he has to go away for a few minutes?—He has to call someone else into the engine-room—not a competent person necessarily.

28142. There is someone else whom he can call?—Well, he will just call in a stoker to see that nobody interferes with the engine while he goes away.

28143. (*Mr. Ratcliffe Ellis.*) There is no winding going on in his absence?—No.

28144. It is simply that he may have somebody there to watch and see that no one interferes?—Yes, that is all.

28145. (*Chairman.*) Have you had many accidents which you can trace to a man being tired out and not doing his duty properly on that account?—Very few indeed. The way we do in Derbyshire and Nottinghamshire is to go through a course of training, of course, the best man makes mistakes at times, and we have had occasions when good men have made mistakes, but very few accidents in this respect have taken place either in Derbyshire or Nottinghamshire, the men being well-trained men.

28146. That I understand, but I was thinking of accidents which might occur in the course of winding even if you had the best-trained men, owing to those very well-trained men working too long hours and consequently getting so tired that they were unable to perform their duty efficiently?—They have been able to do them—they have managed to pull through somehow.

28147. They have managed to pull through somehow up to the present?—Yes.

28148. You think it is a very great strain upon them?—Very great indeed.

28149. Do you find from the mortality statistics that if a man has been an engine-winder for so many years his life will be a worse life than that of an ordinary collier?—Well, no. I am speaking as on old engine-winder of 32 years' standing; of course, a winding-engineman, when he is in care of life and property, has to be a very careful and good-living man and has to take care of himself, and that is the reason, I take it for granted, why the statistics prove so well in our favour.

28150. Then you cannot point to any accidents which have directly arisen from enginemen having worked for too long hours?—No, not in our district.

28151. That is during the whole 32 years of your experience?—Yes, there was an accident long back—I cannot remember the date, but it is several years back—10 or 12 years back.

28152. As regards the general health of the engine-winder you have no reason to think that it is any worse than that of others who are employed in mines?—The vitiated atmosphere of oil, tallow, &c., is something not to be commended.

28153. I have heard that the rule in Germany is that whenever you are winding men there should always be two men in the engine-room, but when you are winding coals only, it is sufficient to have one man. Have you considered that question yourself?—You mean the method in vogue in Germany?

28154. Yes?—No, I do not believe in it myself. I would rather have one engineman there because in some instances they might take off their attention in talking to each other, or interfering in some shape or form with each other, and accidents might be caused.

28155. On the whole you think it is the best plan to have one man who is solely responsible?—Yes—for eight hours.

28156. Working for eight hours only?—Yes.

28157. Leaving the eight hours' point for the moment, what have you to say on the question of giving the men certificates?—We believe in that, of course; and in giving evidence in 1901 before the Select Committee we dealt with this matter fully. Of course, we have good men who do not hold certificates, indeed, there were no certificates at the time that I was winding. We believe that it would be the means of bettering the conditions of the men if they held certificates, and we believe it would minimise the sacrifice of human life. It has been demonstrated, I think, as you will be aware, by previous witnesses, that lives have been sacrificed by having incompetent men in charge of steam-engines and boilers.

28158. You, of course, are aware that the Committee decided against your claim that the winders should hold certificates?—Yes.

28159. I suppose you have read the Report of the Committee?—Yes.

28160. If you have any observations to make upon that Report we shall be very glad to hear your opinion?—We are pressing forward again the Certificate Bill with this object in view.

28161. That is very much the same Bill, I suppose, as the Bill which was before the Committee of 1901. Has it undergone any alteration?—There is an alteration there; it is to embrace the colliery element only.

28162. To confine the necessity for the holding of certificates to colliery engine-winders?—Yes, and stokers.

28163. Enginemen employed in collieries?—In and about collieries. We have had the Bill before the House of Commons for many years, and they say that we have loaded the vessel too heavily—that we had other industries included—the factory element, the marine element, and others. Then we lopped first one off and then the other, and now I suppose I may take it that we have lopped five off, and we take it on these lines now—the colliery element—"in and about mines."

28164. On the other hand, one of the arguments used by the Committee was that if you had certificates at all, such certificates ought to include "All boilers and engines whether worked by steam, oil, gas or electricity, no evidence having been brought forward by those in favour of the Bill to show why any particular class or classes of engines or boilers should be excluded. Your Committee also considered that if that was the case, certificates might with equal reason be required for persons in charge of cranes, hoists, steam-hammers, and other similar machinery"?—Yes. I believe there will be an application made from another source with respect to factories, workshops, and so on.

28165. But you consider that your business is to look after the safety of coal mines?—Yes.

28166. And that it is for other people to consider whether certificates might not be required outside coal mines for similar kind of work?—Yes, either by the Board of Trade or some other body.

28167. Have you anything to say about the Special Rules which are now in force, or the Rules under the Act of Parliament to safeguard miners when they are taken up and down in these cages?—Yes; we should like the 24th Rule, in the latter part of the first Clause, to read: "In any mine which is usually entered by means of machinery, a competent male person not less than 22 years of age shall be appointed for the purpose of working the machinery which is employed in lowering and raising persons therein and shall attend for that purpose during the whole time that any person is below ground in the mine"; we simply wish to have a Clause inserted saying "and shall not be on duty more than eight hours in any case."

28168. Yes, that I understand?—Except in case of emergency.

28169. Is there any other alteration which you can suggest either in the Coal Mines Regulation Act or in the Special Rules which are in force in your district, or in any other mining district?—Our National Federation have dealt with these clauses; there is one with respect to detaching hooks.

28170. I see that Mr. Hopkins, who is going to give evidence on behalf of the South Wales Enginemen's Association, will suggest that "At all shafts where men are raised or lowered safety detaching hooks or an automatic apparatus for the prevention of overwinding should be used"?—Yes.

28171. I understand that under the present law there is an alternative allowed, is there not; you may either have those detaching hooks, or you may not wind beyond a certain pace; that is General Rule 26?—Yes.

28172. You say there ought to be no such alternative, but that in all cases there ought to be detaching hooks used?—Yes.

28173. I may take it that in most mines in Derbyshire and Nottinghamshire there are detaching hooks, are there not?—Yes, in most of them.

28174. Have you any complaints to make as to their working?—No, they work very well indeed.

Digitized by Google

28175. Then you consider that if the detaching hooks which are now used in most of the mines in Derbyshire and Nottinghamshire were universally used that would be quite sufficient as regards that point at all events ?—Yes, we are very much in favour of it. There are collieries in different counties where there are no detaching hooks used.

28176. Then Mr. Hopkins will also suggest that "An adequate steam and foot brake be attached to every winding engine capable of holding—when the cage is in any part of the shaft—any weight raised by the engine where men are raised up or lowered down a shaft." Have you anything to say as to the efficiency of the brakes which are in use in your district ?—Yes, in several instances they get coal from two or three seams in one shaft, and the winders there complain ; as you may be aware, when they run heavy trams of coal in a tub or chair hanging on to the shaft, unless you have a heavy weight to hold it the thing will go round suddenly.

28177. Do you mean to say that in many of the mines which you are acquainted with there is no adequate brake ?—The men complain that the brakes are inadequate ; they simply hold the steam on so that they can feel when they are running on—they simply hold a little steam on, and brake in that way.

28178. I suppose the question which you raise is as to what is an adequate brake, because Rule 30 says "There shall be attached to every machine worked by steam, water, or mechanical power, and used for lowering or raising persons, an adequate brake or brakes" ?—Yes—steam and foot brake.

28179. Do you say there should be an adequate steam or foot brake ?—Both a steam and a foot brake.

28180. You wish to have the Rule strengthened by saying that there must be an adequate steam and foot brake ?—Yes ; you can put the steam brake on without putting the foot brake on, and you can put the foot brake on without putting on the steam brake.

28181. You say there ought to be both, so that either can be used as occasion may require ?—Just so—in case of emergency.

28182. Then another suggestion which I understand will be made by Mr. Hopkins is that a speaking tube should be erected at all collieries for the purpose of communication between banksmen and enginemen. There are many cases where you have either a speaking-tube or a telephone, are there not ?—No. There are many without, and you must know that about a colliery there is such a noise with the machinery and the screens, and the belts, and so forth, that you cannot always hear what the banksmen do say.

28183. Then you think it ought to be compulsory that a speaking tube should be erected for the purpose of communication between the banksmen and enginemen at all collieries ?—Yes, or some other method of signalling.

28184. (*Mr. Ratcliffe Ellis.*) Rule 25 provides for signalling from the bottom of the shaft, but, as I understand, you want some provision made for communication from the top of the shaft to the engine-house ?—Yes, that is it.

28185. (*Chairman.*) Is there any further statement you would like to make on this point ?—There are many collieries where the winding-enginemen, especially on night duty, are compelled to look after other engines and other machinery, and to leave their engine-rooms while persons are below ground in the mine. This is what our men complain about : if they are in another engine-room where the engine is going for the fan, or the pump, and so on, they cannot hear the signals which are given, and in case of emergency, an explosion or an inrush of water in the mine, the engineman would be away and would not be aware of it, because at a good many collieries there are no banksmen in charge of the pit top ; they generally get one of the stokers to do what little banking is required and do not have a banksman there constantly : therefore the winding-engineman is not always aware when any signals have been given whilst he is away performing these other duties, and we consider it very important that the winders should, in accordance with the 24th Rule, remain there and attend there during the whole time that any persons are below in the mine.

28186. Then your point is not so much that the Rule ought to be altered, as that it is not properly observed ?—Yes.

28187. You think that if it was properly observed it is stringent enough ?—Yes.

28188. The point of its not being observed is a very serious thing. Can you not complain to the Mines Inspectors ?—We have done so occasionally, but one does not like to make unpleasantness.

28189. What do the Mines Inspectors say ?—In two or three instances their attention must have been called to it, because they have put a man there on one occasion.

28190. They have put a man where ?—On the bank.

28191. But then that is not a compliance with this rule, because the rule says that this person, who must be a competent person of 22 years of age, shall attend during the whole time that any person is below in the mine, so that whether there is a banksman or not he would be bound to attend ?—Yes.

28192. Then that is a non-compliance with the rule ?—That is so.

28193. You do not get over the rules by employing a banksman. It may be that the danger is got over, but the rule is infringed all the same ?—But what I should like to point out is that the men are compelled to leave their engine-room to attend to other duties, and in the absence of a banksman he is not aware when any signals are given from the pit bottom.

28194. That is so. Then I understand there are two ways of getting over that difficulty : one is always to have a banksman on top who would be about, and who would communicate with the man down below, and the other one is that the man down below should be always in his proper place ?—Yes.

28195. But then, according to the rule, he ought to be in his proper place ?—Yes, but he is not.

28196. (*Mr. Smillie.*) I think the interpretation of this rule is wide : I think this rule is taken to allow of the engine-winder even going into another engine-house, and the Mines Inspectors in some cases say that that is in accordance with the rule. I think what you wish to say is that this rule should be made sufficiently strong to ensure that an engine-winder shall not be required to leave his engine-room ?—That is so.

28197. (*Chairman.*) But then, supposing he has to leave his engine-room for just five minutes, and he calls in another man while he is away, I suppose the other man is competent to attend to the signals ?—Yes, I should say so.

28198. (*Mr. Ratcliffe Ellis.*) There would be no winding during his absence ?—No.

28199. (*Chairman.*) You say that the rule ought to be strengthened by making it perfectly clear that the man ought not to be allowed to leave his engine-room at all ?—That is so.

28200. And that in consequence, of course, he ought to have sanitary conveniences, and so on, so that he should not be obliged to be away at all ?—Yes.

28201. Supposing there were two engines without any dividing compartment between them, so that a man might attend to both of them, and might hear the signals that affected both those engines, would you consider that he ought not to be allowed to work two engines ?—There should be partition walls between the two winding engines.

28202. Why ?—We have had accidents happen where there has been no partition between the two winding engines : we have had a man killed.

28203. How does the partition prevent an accident ?—In one case they were changing the rope : a round rope was on one drum and a flat rope was on the other drum, standing back to back : there was a temporary platform across, and these men were pulling in this round rope to fasten it to the drum : the other rope behind was a flat rope which went in between the horns, and as the man pulled the rope in on to the platform the horns of the drum behind caught hold and pulled him down between the horns of the drum and the platform, a distance of three or four inches, and killed him. That was at Eastwood Collieries, Barber & Walker's collieries.

28204. In that particular case the two drums, one having the flat rope and the other the round rope, were so near that it was dangerous for persons to operate either apparently ?—Yes : there should have been a wall between. There is now.

28205. There is one now in that particular case ?—Yes.

28206. But do you mean to say you think it should not be allowed on any occasion that there should be two winding engines without a partition between them ?—If there were arrangements made so that the winder should

Mr. S. W. Rowarth.

6 Nov., 1907.

be able to manipulate the two it would not arise. Here I do not say but that he could manipulate the two, providing the duties were not so exacting.

28207. So that you would not be altogether against the one man manipulating two engines working in the same room, provided the circumstances were such that he would be sure of being able to hear and to attend to the signals of both engines?—It is only with respect to enabling them to hear the signals: the complaint is that the men cannot hear the signals while they are performing other duties outside the engine-room.

28208. So that you mean that if two signals were going simultaneously from both engines, a man might get confused?—Yes.

28209. Therefore on the whole you consider it desirable that a man should not work more than one engine. Is that your contention or not? You do not go so far as that, I understand?—Well, I say only one.

28210. You think it would be better that he should attend only one?—Only one.

28211. And you would have that made a General Rule?—Yes. You see in some instances the winding-enginemen are in charge of the boilers.

28212. They are in charge of the boilers as well?—Yes.

28213. And you say that ought not to be so?—I say that ought not to be so.

28214. But that you ought to have a fireman in charge of the boilers as well as the winding-man, and that the winding-man ought solely to look after the engine?—Certainly—and the same with the fireman.

28215. I understand that is not so now: you have the men constantly doing firemen's duties as well as winders' duties?—Only during the night shift. Where there is no coal-winding during the night shift some of the winding-enginemen are in charge of the boilers invariably, unless there is some particular business going on that necessitates his being kept in the engine-room.

28216. But you have never known any accident arise from that circumstance of the man on the night shift being always in charge of the boilers as well as of the winding?—No.

28217. Still, do you say it is a practice which ought to be discontinued?—Yes—very much so. The men are complaining very bitterly against it. Men are waiting at the pit bottom, ringing, knocking, and shouting, and they cannot get up.

28218. There is that inconvenience: there is no accident, but very often the signals are not heard, and the men cannot get up?—Yes. There has been an accident when a man got his leg broken in one case.

28219. (*Mr. Ratcliffe Ellis.*) That is not a case where they are winding coal during the night, but it is where a repairing shift is going on?—The roadmen working night shift.

28220. It is not the case of winding coal at all?—No.

28221. (*Chairman.*) You say that owing to this system which is universally prevalent, of a man on a night shift being obliged to do stoking work as well as winding work, it very often happens that men who are down the shaft on repairing shifts are inconvenienced, and cannot get up for some time?—Yes.

28222. (*Mr. Ratcliffe Ellis.*) The complaint which you make is that the last thing a man has to do in his winding shift is to wind men up, and that you think ought to be altered?—Yes, to let the men on the day shift down and to draw the night men up.

28223. That could be altered at present, could it not? Arrangements could be made by which the man could go on a little earlier to wind the men down, so that that should be his first job instead of his last job?—Yes, but you see if there were three shifts the man would only be on for his eight hours.

28224. But will you forget the eight-hours' point for the moment; even with the present arrangement it could be so managed that the first thing the man had to do would be to wind the men down?—Yes.

28225. That could be arranged at present; and you think that would be an improvement?—Yes. The great improvement would be to put the eight hours into operation; that is our contention.

28226. But forgetting the eight hours for the moment, and speaking only about the safety of the men, that could be done now; instead of it being the last thing the winding-engineman had to do, it might be the first thing that he had to do?—Yes, but still the winding-enginemen cannot fix their own hours; it is for the manager to fix them.

28227. Still, if it was thought necessary by these men to recommend that that should be done, in your own experience as a winder when you find you have nothing to do but to look after your engine, and so on, do you say it is a very exhausting thing to have to wind the men down after you have been on duty all night?—Yes.

28228. And you think that although happily there have been very few accidents, yet it would be safer if such an arrangement as that were made?—I do think so.

28229. You said that the engineman in your counties were very well-trained men. Do you not think you might extend that description to all the enginemen everywhere?—Well, I cannot say that.

28230. But you know that not only in your county, but generally, accidents are very few indeed?—Yes, they are.

28231. That is a very strong certificate for the competency of the engineman?—Yes.

28232. Do you not think that is a better certificate than you would get from the Home Office?—No, I do not think so.

28233. What would be the advantages in point of safety which it occurs to you would result from having Home Office certificates?—We would be better prepared; we should be certain that we had competent men. As you know, they are in vogue in the Colonies.

28234. Do you think the men would be better than they are now?—I think they would. The men would have a better chance in their lives, too, if they had certificates.

28235. Have you seen the Report which was issued by a Safety Catch Commission in the Transvaal?—No.

28236. They have certificates there; you are aware of that?—Yes.

28237. This is a paragraph 138 on p. 25 of the Report: "In 2½ years out of a total number of 67 overwinds, 56 were due to the engine-drivers' neglect, and of this number 13 were caused through the engine-driver having his reversing lever in the wrong direction. The majority of these drivers were certificated, and there no question arose as to the competency." ?—Yes. I do not say that the certificate would make the men any better in that respect, because the best of men make mistakes, and even although a man may be certificated, he may make a mistake.

28238. Then in point of safety do you think the certificate would be any advantage? I am not speaking about the status of the engine-winder, but I am asking you to confine your attention purely to the question of safety; do you think it would be an advantage?—I do.

28239. You know the objection that I made before that Committee in 1901 to this question of certificates?—Yes.

28240. That it would tend to establish a particular class who might control the access to the mine?—I remember it.

28241. Would you be prepared, in case it should be considered desirable, to recommend the granting of certificates to do two things, first of all to have it provided that the enginemen should be required to teach the persons whom the manager of the mine sent to be taught?—The man whom the manager sent to learn to wind might not be a man who could take to a winding engine. All men are not adapted alike.

28242. Then who is to decide that, from your point of view?—I do not say that the recommendations of the managers would always be the right ones. I think the enginemen would be the proper parties to judge as to the fitness.

28243. I do not wish to misrepresent you; I only want to know exactly what your view is. Then your view is that the engineman should decide whom he should teach?—I do not say that.

28244. How far do you go?—You know that we have, as most Associations have, rules to be governed by. We say that these men should have a training. There have been times when incompetent men have been taken into winding-engines and the result is that there have been accidents. You know that obtains in Lancashire, do you not?

28245. I think you must excuse me from answering questions. I want you to tell me this; how far would you go—would you say that the engine-winder is to decide whether he should teach a man who is sent to him to be taught or not? Your rules provide that he must go as far as that—that he must only teach people who are

Digitized by Google

approved by the Association. I want your opinion with regard to this; in your view should the engine-winder decide who he should teach?—Well, yes.

28246. The second question that I want to ask you upon this is, would you be in favour of a provision in any Act of Parliament requiring that a certificated man only should be allowed to wind, that the Home Secretary might permit other people to wind under circumstances when he thought it might be right to do so?—Yes, I could not say that that would do any harm.

28247. With regard to safety catches there is no General Rule at present. Do you think there ought to be a General Rule for compulsorily providing safety catches?—Yes.

28248. Are you not aware that there are two opinions as to the desirability of safety catches; some people think that they might come into action when they were not wanted, and cause mischief, and some people think—and very clever men, too—that they had better depend on the ropes than on safety catches?—Yes, there are two opinions respecting them. The sudden operation of the safety catches in some instances, unless the ends of the cages are of such a nature that they prevent the men from falling off, might, or would, jerk them off the cage.

28249. Then they might come into operation when they are not wanted to come into operation?—Yes, that might be so.

28250. Do you think, again, that they are suitable to anything but wooden conductors?—Yes, they can be adapted to steel ropes.

28251. Do you think they can be so adapted safely?—I think so. I have seen sketches of them where it is shown that they would grip.

28252. Are you judging merely from sketches—plans?—Yes.

28253. Not from any actual experiment?—No.

28254. Bearing in mind that there are these two opinions, do you think still that it is desirable to make the use of safety catches compulsory?—I do not say so.

28255. You would not go so far as that?—No.

28256. With reference to detaching hooks, that is provided for, or there must be a limitation of the speed at present?—Yes.

28257. You want something to prevent over-winding?—Yes.

28258. But whether it is a detaching hook or some other contrivance, if it is effective you do not mind which it is?—That is all we care about.

28259. Have you any experience of Bertram's patent?—No.

28260. They are in use at many Lancashire collieries, and the effect is that if the speed is not reduced when the cage arrives at a certain point in the pit, which is fixed, the steam is shut off automatically, and the speed is reduced?—Yes.

28261. What do you think of that?—I have not had any experience with respect to those; I have only had experience of the detaching hooks—Calow's patent, and King's patent.

28262. Of course, manifestly it would be better to stop the engine, would it not; there would be no over-winding if the engine was stopped?—It would be impossible to over-wind if the engine was stopped.

28263. Then if you have that vizor, and if the speed is not reduced at a certain point and there is danger in that event happening, if the steam is automatically shut off there can be no over-winding?—Yes. It is a very good apparatus.

28264. What you think is that there should be the best provision made against over-winding?—Yes.

28265. But whether by detaching hooks or by vizor, you do not mind: you would not object to any system?—Either by detaching hooks or by the system you are alluding to.

28266. Now in the case of the person attending the engine-house during the day, of course when the coal winding shift is going on none of these difficulties that you suggest arise?—No.

28267. The man is in the engine-house all the time winding, and the banksman is there, and very generally there is a signal from the banksman to the engine-house, is there not?—Yes.

28268. You want that made general?—Yes.

28269. In the night, when the repairing shift is on and not the coal-winding shift, is it safety or convenience that you want to provide for?—It is safety.

28270. If the man is not in the engine-house at the time, there is no winding. In some cases it may be that he is not there and therefore cannot hear the signal from the banksman, and the people are kept at the bottom of the pit, but they are not in danger?—But people are going up and down continually at many collieries during the night.

28271. Not when the engine-winder is not at the engine?—No. He is somewhere else doing some other work.

28272. Then who is winding?—Nobody.

28273. How can they then go up and down the pit?—They have to wait until he comes back.

28274. That is what I mean, that it may be an inconvenience to them, but it does not affect the safety?—Do you mean the safety of the men down the mine?

28275. Yes, the absence of the engine-winder from the house at the time when there is a banksman signalling and the men are wanting to come up. I can understand the point of inconvenience, but does it affect their safety?—We have had people lamed and with their legs broken, waiting at the pit bottom for an hour or an hour and a half.

28276. In cases where there has been an accident to a man there has been delay in having the man pulled up?—Yes, and in cases where the horse-keeper has wanted to come up, or other people—the deputies.

28277. How many cases can you mention in which there has been an accident and in which a man has had to wait for an hour before he could be drawn up?—I could not quote the number, but there are a good many in the collieries in Derbyshire and Nottinghamshire where there is only one winder on duty for 14 hours on the night shift.

28278. But I am on this point of the winder not being on duty at the engine-house at the time the men want to come up the pit, and I want to know how that affects the safety of the men. You have given me the case of a man having met with an accident and there having been delay in bringing him up: that delay might be injurious, probably?—Yes.

28279. But assuming that men have not met with accidents down the pit, how does this delay in bringing them up affect their safety?—I cannot say that there is anything unsafe there.

28280. (*Chairman.*) Except in the case of an accident?—Except in the case of an accident.

28281. (*Mr. Ratcliffe Ellis.*) You have made the suggestion that there should be both a foot brake and a hand brake?—Both a foot brake and a steam brake.

28282. Have you any other suggestion to make as to the engine itself, for the purpose of increasing the safety of the mine?—No.

28283. Have you ever seen cases where the rope is not wound on a drum, but there is a single rope, one going down and the other coming up?—Yes.

28284. Do you approve of that method?—I should like to understand you fully.

28285. I mean that the rope does not coil itself on a drum, but there is only one rope, which is attached to the descending cage and the other end of the rope is attached to the ascending cage, and it just winds round the wheel.

28286. (*Mr. Smillie.*) Round a friction wheel?—No.

28287. (*Mr. Ratcliffe Ellis.*) You have not seen that?—Do you mean those conical drums?

28288. No, not a drum at all?—No, I have not seen that.

28289. Then you have no other suggestion to make as to the engine?—No.

28290. Do you say anything about the rope?—No.

28291. Have you no suggestion to make by way of improvement as to the examination or the testing?—No, we have nothing to complain of in our district in that respect.

28292. (*Chairman.*) Have you never had an accident from the breaking of a rope, that you remember?—No: they very rarely occur in our district—very rarely indeed.

28293. (*Mr. Smillie.*) You say you are in favour of certificates of competency being granted to all engine-winders?—Yes.

28294. And to firemen, too, I think?—Yes.

Digitized by Google

Mr. S. W. Rowarth.

6 Nov., 1907.

28295. By "firemen" do you mean boilermen and stokers?—Yes.

28296. In answer to Mr. Ellis you said you had no objection to putting the power into the hands of the Home Secretary (even in the event of a law being laid down that winders must hold certificates) in an emergency to allow men who did not hold certificates, to wind. You say you have no objection to that?—Yes.

28297. Supposing it were the law that engine-winders must hold certificates of competency, you only claim that in the interest of the safety of the miners?—That is all.

28298. Supposing a strike of engine-winders took place about some question, do you then give up any thought that you might have for the safety of the miners?—No, I do not give it up.

28299. You say you would allow the Home Secretary in an event of that kind to permit a non-certificated winder to wind?—I suppose the Home Secretary would see that they were competent men without their being certificated.

28300. But if it is in the interests of the safety of the miners really that enginemen should have certificates, why should they allow the lives of the men to be in the hands of uncertificated men? Do you not think the enginemen would be in favour of putting it into the power of the Home Secretary to allow an uncertificated man to wind?—No, I do not think they would.

28301. Do you not think the miners would decline to allow a thing of that kind?—I think they would object to it.

28302. Do you think the engine-winders would not be prepared to allow it to be put into the hands of the Home Secretary to have power to do that?—Yes.

28303. Do you think that the engine-winders would be inclined to consent to a provision being put into the Act allowing the Home Secretary to permit uncertificated engine-winders to wind in the case of there being a strike of the certificated engine-winders?—No. As to that, I think my answer to Mr. Ellis did not refer to allowing permanent engagements.

28304. I know what Mr. Ellis meant, but I think you do not?—I do not think it should be allowed except in case of emergency.

28305. Yes, in case of emergency. Supposing 5,000 certificated engine-winders were either locked-out or on strike, you would not be in favour of the Home Secretary having a power of that kind in that case?—I should not.

28306. (*Mr. Ratcliffe Ellis.*) Would you add to your answer the reason why you would not be in favour of it in that case?—My meaning was in case of emergency if there was no certificated man there, that the manager should be empowered to send a competent man.

28307. But I should like you to give your reason for the answer which you gave to Mr. Smillie that you would not, under the conditions which he suggested, be in favour of an exemption?—We would abrogate our rights by so doing as Trade Unionists.

28308. (*Chairman.*) What you mean is that if for the moment it was necessary, owing to the sudden illness, we will say, of an engineman, that someone else should be employed, and that there was an uncertificated man to employ instead of him, then the manager of the mine would be empowered to send someone else to do his work for him who was competent?—Yes, that is my meaning.

28309. (*Mr. Smillie.*) You would have no objection at all in the case of emergency arising at the colliery, where a certificated engine-winder could not be found for the time being, to a clause being put into the Act saying that a competent person who was uncertificated should be allowed to wind?—I should have no objection to that.

28310. But you would draw the line at 4,000 or 5,000 uncertificated persons being allowed to wind?—Yes.

28311. Is that because it would increase the danger?—Yes, it would increase the danger, too.

28312. We may take it that if you are correct in your contention that it would increase the safety of the lives of miners to have certificated winders at all the engine-houses, you think it would increase the danger if at any time non-certificated engine-winders were put in charge?—I do; that is my meaning.

28313. (*Mr. Ratcliffe Ellis.*) If I might interpose a question, I should ask you this: when you say it would abrogate your rights as Trade Unionists, to put it in plain English you mean it would prevent you imposing upon the colliery owner whatever terms you might think fit. That is the plain English of it, is it not?—No.

28314. (*Mr. Smillie.*) You are aware that at the present time managers in charge of collieries must hold certificates of competency?—Yes.

28315. You have never heard it suggested that in the event of a dispute between colliery managers and colliery owners the Home Secretary should have the power to put the mines of the country in charge of uncertificated men?—No, I do not think that would be done.

28316. And you do not think that the managers are anxious to continue the certificates in order to place them in the position of dictating terms to the employers?—No.

28317. But in the interests of the safety of underground workers, you think the engine-winders should have certificates?—That is so.

28318. Mr. Ellis put a question to you suggesting that you might, by arrangement with the managers, obviate the dangers which you say arise from engine-winders at the end of their shifts lowering the men in the morning?—Yes.

28319. You said that if an engine-winder coming on a day's shift came an hour or an hour-and-a-half sooner, then he would be fresh, and he could lower the day shift?—Yes.

28320. You stated that that was quite true and that that could be so?—That could be so.

28321. But in a colliery where there are two shifts supposing an engine-winder started at five o'clock instead of seven o'clock in the morning, and lowered the day shift when he was fresh, would he not have to raise that same shift when he was not fresh?—Exactly.

28322. And it would not obviate that at all where there were two shifts in a mine?—That is so; and there are many collieries where there are two shifts

28323. Even in the instance which Mr. Ellis gave, that a man may be fresh when he is lowering that shift; he would also have to raise that shift at the end of his time, and the same danger would arise in that case?—Yes, exactly.

28324. (*Chairman.*) Could not the shifts be arranged in such a way that the man who lowered at the beginning of the shifts should be allowed to go off just before the men were required to come out of the pit, and then that the next man should raise the men who were in the pit and lower the men on the next shift at the beginning of his work. He might perform the two operations in the beginning of his shift; the first operation would be to take up the men at the beginning of his shift, and the second operation would be to send the men down for the next shift?—I do not know whether that could be arranged.

28325. (*Mr. Smillie.*) I can see perfectly well that the objection of the engine-winders is that a night-shift man is on for 14 hours, and naturally you agree that an engine-winder may not be in the best condition for lowering men under those circumstances?—Yes.

28326. Mr. Ellis says that instead of that, the day-shift winder might come on earlier in the morning and relieve the night-shift winder, and that he would be able to lower that shift of men when he was fresh, but then that shift of men would come up again during his shift?—Yes.

28327. If an engine-winder's eight-hours' day were enforced, then at the end of that man's shift he would be going off at the conclusion of that eight hours, and a man would come on fresh at the beginning of the next shift?—Yes.

28328. The usual thing is to have an eight-and-a-half hours or a nine hours' shift, and the men who are lowered by the engine-winder in the morning come up again before that engine-winder's shift is finished—unless he is on an eight hours' shift?—That is so.

28329. (*Chairman.*) Would it not rather go to this, that it might be a convenient thing that whatever shift there was underground, the same length of shift should also be imposed upon the enginemen, so that if it was an eight-and-a-half hours' shift the enginemen should also have an eight-and-a-half hours' shift, or if it was a 10 hours' shift, as it is in some cases in South Wales, that the enginemen should have a 10 hours' shift. In that way you might make it certain that a man always did the greater part of his work when he was fresh and beginning the shift. Would it not be desirable that a man's shift should begin and end at very much the same time as the colliers' shift begin and end?—Well, different conditions exist at different collieries: some collieries work, as Mr. Smillie has said, about eight-and-a-half hours or nine

Digitized by Google

hours, some work 12 hours: and we have collieries where they are now working, the trade being brisk, one full shift and another following on relieving them; and, as Mr. Smillie says, the engine-winder would have to contend with those people just the same unless an eight-hours, shift was being worked.

28330. (*Mr. Smillie.*) Supposing Mr. Ellis's suggestion were adopted, the day-shift winder would lower it might be 200, 250, 300 or even 700 men into the mine?—Yes.

28331. Is there not at the present time in modern collieries a considerable stress on the day-shift winder?—More so than ever.

28332. He scarcely gets a chance to lift his eye from his signals from morning till night?—Yes, he is taxed more than ever.

28333. The stress is greater on him now than it ever has been before?—With modern and up-to-date machinery there is a greater tax on the winder than there ever was.

28334. Supposing that a winder lowered the men in the morning by coming on a bit earlier in his shift, and then had eight hours or eight-and-a-half hours' continuous winding, is he in a fit state, after the strain of winding, to raise those men at the end of the shift?—He is not—and that is our contention for the eight-hours' day.

28335. He would not even be in as fit a state to raise the men that night as the day shift man would be to raise the men in the morning?—He would not; he would be worse.

28336. (*Mr. Wm. Abraham.*) But would it not be impossible to arrange it in that way unless the shifts are 12-hour shifts?—Yes.

28337. There would be some portion of time that the man would not be there at all—unless he is to be there from 12 to 14 hours?—Yes.

28338. (*Chairman.*) My suggestion was that, m order that the man should do the greater part of his winding at the beginning of every shift, it might be advisable, so far as possible, to make the winding shifts coincident with the working shifts, that is to say, that when an engine-winder has come early in the morning and wound the men down, then he should work on until the time arrived for the men to come up again?—Yes.

(*Mr. Smillie.*) That would be about eight hours.

28339. (*Chairman.*) Yes, or it might be eight-and-a-half or nine hours?—Yes, it might be.

28340. If it was considered to be dangerous to employ a man in winding for more than nine or ten hours, or a specified number of hours, then that state of things could not exist—you could not always make sure that a man did the most of his winding at the beginning of his shift as you would like to do?—That is so.

28341. (*Mr. Smillie.*) We know that Mr. Ellis would be with us in regard to regulating the hours of engine-winders if it could be proved to his satisfaction that there is really a danger to human life underground by reason of the engine-winders working too long hours?—Yes.

28342. And I take it that his difficulty is to arrange it so as to provide the safest course?—We have collieries where they bring the winder on at 6 o'clock in the morning, and he winds until 12 noon; then another man goes on at 12 noon, and winds till 2 o'clock: but the one that went on at 6 simply looks round the machinery and oils it up and so on, and then takes charge again from 2 o'clock till 3 o'clock, and then he goes home having been there nine hours and having been winding for seven hours. Colliery owners recognise the responsibility of the duties of these people to that extent. The man who then goes on at 12 remains until 9 o'clock in the evening, finishes the drawing of coal, draws all the men out and remains till 9 o'clock. Another man comes on at 9 and remains till 6 o'clock the next morning. There are three winders at that particular colliery. But then there is the other illustration I gave of two shifts of ten hours and one of 14 hours—the night man who is on 14 hours with all this number of men to get down.

28343. Are there many eight-hours' shifts?—A good many in Nottingham.

28344. The colliery owners have themselves recognised the desirability of it?—They have.

28345. Do you know of certain collieries in Scotland where the same thing is recognised, and where the engine-winder has to wind for an eight-hours' shift and a certain amount of output?—That is so, I believe. We have an application before our coal owners at the present time for the same purpose—an eight-hours' shift.

28346. What is the greatest number of men riding in one cage in Nottinghamshire?—20.

28347. Therefore, in certain collieries in Nottinghamshire, there may be 20 men ascending and 20 descending?—That is so.

28348. So that there might be 40 men in the shaft?—Yes.

28349. You are aware of some collieries where there might be 40 men in the shaft at the same time?—Yes.

28350. Would the lives of those 40 men in a colliery in Nottinghamshire depend upon the nerve, ability and skill of the engine-winder?—That is so.

28351. Their lives depend even on more than that—they depend upon whether he is absolutely healthy and strong?—Yes.

28352. He might, by reason of sudden illness, heart failure, or anything of that kind, accidentally fail, and the probabilities are that under those circumstances the lives of those 40 men would be sacrificed?—Yes.

28353. In answer to his Lordship, you said you were not in favour of two men being in the engine-house?—That is so.

28354. Have you known of any case in which through heart failure or sudden illness an engine-winder has fallen down in his engine-house and an accident has taken place?—I have heard of a case in Lancashire, but we have not experienced one in our counties.

28355. Do you know that the Mines Inspectors have in some of their Reports called attention to such cases? One Inspector has called attention to two cases at least where that has taken place?—Yes, I believe that is so.

28356. Where there is a considerable number of men being raised and lowered at the same time, do you not think it is a very serious risk to put upon the health of one man the lives of 40, 50 or 60 men who may be going up and down a shaft? In a case of that kind, where men are being wound up and down, would it not be well to have another engine-winder for the time being there?—It would in a case of that kind.

28357. For instance, the Commissioners visited a colliery in Germany at which 140 men were in the shaft at the same time, and the lives of those men depended not only upon the engine-winder being skilful and steady, but also upon his health for the time being?—Yes.

28358. There were two engine-winders in that room?—(*Mr. Ratcliffe Ellis.*) Not engine-winders, but learners.

28359. (*Mr. Smillie.*) There were two persons, either of whom could have stopped the engine, I think. I do not think any person on the score of expense would object to a second winder being present for an hour each day?—It would be a very good thing indeed.

28360. Your objection to Rule 24 is that the intention of the rule is not carried out?—It is not.

28361. Do you consider that the intention of Rule 24 was that the engine-winder should at all times be in the engine-house beside his engine while men were underground?—Yes, whilst there were men down the mine, I do.

28362. And the point really is that the intention of that rule was not carried out, if that was the intention of the rule?—If that was the intention, it is not carried out.

28363. Because night-shift winders, as you say, have to look after their boilers?—Yes.

28364. And very often they have to look after a fan engine, or sometimes a pumping engine, and they have many other duties on the surface?—Yes, being in charge of boilers, and so on.

28365. You think that interferes with their being able to look after the safety of the men underground?—It does indeed.

28366. Is it not the case that engine-winders, as an association, and I believe individually, object to more than one engine being in the same engine-house?—Yes.

28367. They are desirous that only one winding engine should be in an engine-house?—That is so.

28368. There are cases where there are more than one winding engine in the winding engine-house, and there is a considerable noise caused?—Yes.

28369. It may be that there is a pumping engine or a hauling engine side by side with the winding engine?—Yes.

28370. And sometimes even the signal bells of the hauling engine are in the engine-house where the winding engineman has to attend to his own engine?—Yes.

Digitized by Google

Mr. S. W. Rowarth.

6 Nov., 1907.

28371. That very often leads to misunderstanding, I think, or at least it may lead to the engine-winder misunderstanding the signals?—It has been so. The winders have started away with the impression that the signal has been given when it has not been given.

28372. Consequently you think it would be in the interests of safety if it were laid down by law that only one engine should be in the winding engine-house, and that an engine-winder should attend to it only for the time being?—Yes.

28373. (*Chairman.*) I should like to ask you with regard to this question of who should decide as to whether persons should be taught engine-winding or not; do you think that it ought to be entirely in the hands of your Union to decide as to who should be taught engine-winding?—Well, yes.

28374. That it should be absolutely in the hands of the Union that they should have power, without giving any reason, to say that they did not consider that any particular person was eligible?—We take it in this way: we do not like to dictate to the management in this respect, but we do take into consideration competent men, and by promotion bring them from other engines; we first teach them to generate steam and then how to use it, and those of our members whom we know, we say are the men to be the future winders, and that it should not be left exactly in the hands of the managers to say who shall or who shall not be the winders.

28375. You say you insist upon certain preliminary training—that a man should not get a certificate until he has gone through certain processes and fully understands them. But supposing a man wants to begin at the beginning and says that he wants to learn a particular process, say the first process that is learnt in the course of his studies, why should you object to any man being taught?—He cannot get the knowledge except by experience.

28376. That is so, but supposing a man wishes to get that knowledge by experience, or supposing a person of the usual and proper age to begin instructions in engine-winding says "I should like to be taught engine-winding," on what grounds would you refuse the application? Would you refuse the application simply because there were enough certificated engine-winders and you did not want any more? Would that be sufficient ground in your opinion?—No.

28377. Perhaps you would insist upon a man being a member of your Union; or promising to become a member of your Union; would that be a condition?—Yes, we should.

28378. Supposing a man did say "I am quite willing to become a member of your Union and to subscribe to your Rules, and I want to learn engine-winding": would you say to him "We have got enough engine-winders and we do not want any more"?—No.

28379. You would not desire to restrict the numbers?—No.

28380. You would simply inquire whether he was a man of reasonably good character and fair ability?—Yes.

28381. And if you found that he was a man of reasonably good character and fair ability you would not refuse him simply on the ground that this particular business of engine-winding was likely to be overdone?—No; if he had those necessary qualifications we would take him.

28382. Have you ever refused to allow a man to be taught if he said he would belong to your Union?—No.

28383. (*Mr. Smillie.*) The position put forward by Mr. Ellis was, would you object to the manager at his own colliery going into his own engine-house and saying "We want you to teach this man." Your position is that you ought not, as an engine-winder, to be forced to teach any person whom the manager sent?—No.

28384. But if it were laid down by law that engine-winders must hold certificates of competency, it is just possible that there might be schools for teaching engine-winders just as there are schools now for managers?—That is so.

28385. You would have no objection to men trained in those schools becoming certificated?—No.

28386. Consequently there might be no limit to the number of certificates granted?—No.

28387. And it would not be fair to say that you would object to trained persons merely in order to prevent a certain number getting certificates?—That is so.

28388. It is only that you feel you ought to be entitled to have some say as to whom you should give instruction to?—That is so.

28389. (*Mr. Wm. Abraham.*) You feel that the training you give now is essential and necessary in order to make those persons qualified winders?—I do.

28390. (*Chairman.*) But supposing the managers, for instance, were to set up a training school for winding-enginemen, and they were to teach boys how to wind and to get them to a certain degree of proficiency in the schools, would you insist that after they had passed a proper examination in those schools they should belong to your Union before they could go in for their certificates?—I do not say that.

28391. (*Mr. Ratcliffe Ellis.*) There is a Bill which you are promoting again, or intend to promote again, during the coming Session, to provide for certificates?—Yes, I believe so.

28392. And that is also to be confined to winding engines at collieries, as the last Bill was?—I believe so.

28393. The Select Committee reported that colliery engines were the engines as to which certificates were least needed. That is so, is it not?—I do not think so.

28394. I see the Report says: "The Committee are of opinion that the provisions of the Mines Regulation Act, 1887, the General Rules incorporated with that Act, and the Special Rules which are fully detailed in the evidence of Mr. Ellis (Questions 2210-2220) are admirably adapted to secure the selection of competent persons for taking charge of engines and boilers and for fixing the responsibility in the case of mines." Your Bill at that time applied to all engines and boilers?—Yes.

28395. The Committee said that the present regulations are admirably adapted, with reference to mines, for the selection of competent persons: and still you are proposing a Bill to legislate for that very industry which the Committee decided was at present sufficiently equipped with General and Special Rules to secure competency?—We do not agree with that.

28396. No, I understand you do not agree with that: but that is a fact?—That is a fact.

Mr. WILLIAM HOPKINS, called and examined.

Mr. W. Hopkins.

28397. (*Chairman.*) You appear here on behalf of the South Wales Enginemen's Association?—Monmouthshire and South Wales.

28398. The South Wales Colliery Enginemen of all grades, Stokers and Surface Craftsmen's Association, which has a membership of about 8,000?—Yes.

28399. How many are employed on similar work that are not in your union?—I could not say exactly as to the number in the coalfield altogether. Mr. Jones, the gentleman who is coming after me, represents a large number of winding enginemen who may be able to do that: the majority as regards winding enginemen are his, but I have a large number.

28400. The majority of winding enginemen belong to your union?—The majority to Mr. Jones', as far as the winding enginemen are concerned.

28401. You mean you and Mr. Jones together?—Yes, but I have a large number in my organisation.

28402. I want to find out what proportion of men are in your union and what proportion are outside it. Can you tell me at all?—Taking the whole of the enginemen and stokers, in the mechanical department, I think we have got at least 80 per cent. I will put it in that way.

28403. Eighty per cent. belong to your union?—I should put it at that.

28404. The great majority, at all events. You have heard what Mr. Rowarth has said; do you wish to make any comments on his evidence?—I should like to touch upon all the questions with the exception of an adequate brake. I agree with what he has said upon that point.

28405. The steam and foot brake?—Yes.

Digitized by Google

28406. With regard to safety detaching hooks or automatic apparatus for the prevention of over-winding, you agree pretty well with what Mr. Rowarth said, that is to say, that some sort of apparatus ought to be used, not necessarily a safety detaching hook. Possibly the question might be dealt with by automatic shutting off of steam, or in some other way?—Quite so.

28407. At all events something must be done to prevent over-winding?—Yes.

28408. You have over-winding accidents in South Wales?—We have been very free from over-winding accidents in South Wales.

28409. You say that a speaking tube should be erected at all collieries for the purpose of communication between banksmen and enginemen. Do you agree with what Mr. Rowarth said, that it need not necessarily be a speaking tube, but some other means of communication—the telephone?—Yes.

28410. There must be some means of communication?—That is right.

28411. You go on to say that periodical inspection of all colliery engines and boilers should be made by an Inspector appointed for such specific work by His Majesty's Government. There is a very considerable inspection now going on. There is an inspection when boilers are insured by the Insurance Company?—Yes, but there are a large number that are not in the Insurance Company.

28412. You do not think those are sufficiently inspected?—That is so.

28413. What do you go upon when you say that? Have there been accidents?—From what I have heard from the men, some boilers are allowed to go for a number of months without being cleaned properly. I may say at other collieries they do it monthly, but not at all collieries.

28414. I suppose underground boilers are constantly being looked at?—Just in the same way. I do not know that there is any more inspection of them than upon the ones at the surface, unless they are insured.

28415. You say they are not all insured?—No, not to my knowledge.

28416. I see the Factory Act only requires every steam boiler to be examined thoroughly by a competent person once at least in 14 months. That would hardly be enough?—It depends upon the water. There is water in some collieries where it requires the inspection every month. There is a vast difference in the water used in boilers. I may say that locomotive engines, where the water is very poor, they inspect or clean every week, but where the water is better, it may be every fortnight.

28417. Would you suggest that there should be any General or Special Rule on the subject?—What I would suggest would be that there should be an inspection at least every month by the colliery management, at longer periods by Government Inspectors.

28418. (*Mr. Wm. Abraham.*) Do you have a rule to that effect?—I should suggest that.

28419. (*Chairman.*) A rule that every boiler should be inspected once a month?—Yes.

28420. You would put that into an Act of Parliament?—I would suggest it.

28421. Then you say that protectors should be fixed in front of all water-gauge glasses of boilers so as to prevent steam issuing and fragments of broken glass injuring the person who may be in charge, in case of an accident. Is that done generally?—It is done at large collieries, but I may say there are many that are not adopting that. Steam recently has been raised to such pressure, as much as 140 and 150 at some collieries, that if men are before those boilers and there is an explosion, fragments injure the men. We have sent in several claims recently upon that matter.

28422. You have had several accidents?—Yes, in that way.

28423. Do you find that there is any difficulty in getting the managers to agree to this?—We have not enforced that upon them. I know some managers adopt it themselves.

28424. That would be a very small matter?—It would be a very small matter, but it would be a great safeguard to the men. It might be the means of saving a man's face or head, and saving him from serious injury.

28425. In point of fact it has caused serious injury?—Yes, to some of the men.

28426. Then you say that each and every engine-house, either above or below ground, where steam pipes are carried under the floor or through such houses, shall be provided with two ways of ingress or egress. Is that generally done?—There are instances where it is not done, but very few. As a rule the managers are attempting to do that, but we put this down so as to have it a general thing.

28427. What is the object of it?—Supposing, for instance, a pipe explodes, and there is only one way to get out, a man would have to go through the steam; whereas if he had two ways he could get out by the other. There would be two ways of escape.

28428. Have you known accidents happen in that way?—One happened at Tredegar, I think it was two years ago. The men were repairing pipes down below in the shaft.

28429. (*Mr. Ratcliffe Ellis.*) In an engine-house?—It was not in an engine-house. It was going through; I thought that meant the same thing. There is also an accident which happened in Clydach Vale in the same way. I am not sure whether there are two ways of egress.

28430. (*Chairman.*) In some cases it would be very difficult to provide this second egress?—I cannot say. Underground, supposing there were two ways to go into the engine-house, so that the men could run out whichever way it was possible to escape——

28431. Do you think it would be reasonable to compel all mine managers to provide two means of egress? Would it not involve very considerable structural alteration very often?—I do not think so, especially in engine-houses, as is mentioned here.

28432. Do you think it ought to be made a General or a Special Rule?—Yes.

28433. You would have it put into an Act of Parliament?—I would.

28434. (*Mr. Wm. Abraham.*) You are speaking of on the surface?—At any engine-house, not only on the surface, above or below the ground. Allow me to give one instance. I was working an underground engine, and our engine was about 300 yards or more behind the pit. The place where the engine was situated was in an arch, and that was bricked behind, and the boilers were in front. If something happened to our pipes we should have to run through that steam, but I am pleased to say that our management saw the advisability of knocking the wall down and making a hard heading, so that we could get out another way. If something happened in front of the boilers we could go round the other way.

28435-6. (*Chairman.*) You want some alteration in General Rule 24.

(*Mr. Ratcliffe Ellis.*) It is a very important alteration.

(*The Witness.*) I will explain the idea we have. If you read Rule 24 it states: "Where any shaft, plane, or level is used for the purpose of communication from one part to another of a mine, and *persons* are taken up or down or along such shaft, plane, or level by means of any engine, windlass, or gin, driven or worked by steam or any mechanical power, or by an animal, or by manual labour, the person in charge of such engine, windlass, or gin, or of any part of the machinery, ropes, chains, or tackle connected therewith must be a competent male person not less than 18 years of age." Sometimes there is only one man riding, and to meet such a case I would suggest that the rule should read "where any shaft, plane, or level is used for the purpose of communication from one part to another part of a mine, and *any person or persons*, etc." I had a discussion with some of the managers in our district, and I sometimes suggest that wherever a rider is on a journey no man should be employed at the engine under 18 years of age. I have endeavoured to point out that is the meaning of the Act, but they reply by saying that the word "persons" means the plural and not the singular when I say "rider." My point is, if it is essential to look after the interest of persons, it is quite as essential to look after the interest of a person. I say that where riders are on the journey all day, then there should be a male person not less than 18 years of age. That is the reason.

28437. If something happened there would be only one rider. There is generally more than one?—Very seldom there is more than one; he might have an assistant.

28438. This would be a very considerable alteration of the law. You would have this competent person of 18 in many cases where he would not be required now?—That is right.

Digitized by Google

Mr. W. Hopkins.

6 Nov., 1907.

28439. (*Mr. Smillie.*) Do you mean the managers claim that under this rule where only one person rides, the person in charge may be under 18 years of age?—Yes.

28440-1. (*Chairman.*) You must have somebody. The question is whether he must be over 18.

(*Mr. Smillie.*) They might start a lad of 14 or 15 who is not a competent person, and hide themselves behind the section.

28442. (*Mr. Wm. Abraham.*) What you simply want is that the same protection should be provided for the one man as there is provided for the many?—Exactly. That is my point.

28443. (*Chairman.*) You say that it is an important point because these competent male persons of over 18 years of age are not put on except when a number of men are conveyed to and fro?—I do not say that. I say at many collieries they put men on, say 22, or 23, and some 30 years of age; but there is a possibility, and there are some employers who find younger lads could do it—put these men on where riders are.

28444. Where there is one rider? You say, generally speaking, there would not be more than one rider?—Yes.

28445. (*Mr. Ratcliffe Ellis.*) That is where there is a train of full tubs in charge of one person, a person younger than 18 is put to manage the winding apparatus?—No, wherever you might get a strong lad of 18, if he can work the engine, they allow him to do so.

28446. That is where there is a train of full tubs in charge of one person?—One or two, it does not matter which.

28447. (*Chairman.*) It does matter. It is clear if the tubs are in charge of two persons the rule applies, and somebody over 18 must be employed?—We will confine ourselves to one. That will answer our purpose.

28448. Do you know as a matter of fact that the mine managers take advantage of the wording of this rule, and where one man alone happens to be in charge of a number of tubs a boy under 18 is sometimes employed in hauling and looking after the arrangements?—Yes.

28449. (*Mr. Ratcliffe Ellis.*) Can you say where that is?—I should not like to specify, especially in the large collieries where a number of enginemen are concerned.

28450. (*Chairman.*) You know, in point of fact, where one man rides in these tubs and the mine managers say the plural is used, and consequently it is only one man and this rule does not apply?—Yes.

28451. (*Mr. Ratcliffe Ellis.*) Can you give us some idea where these collieries are?—

(*Chairman.*) We should like to know. It seems an evasion of the rule?—It would apply to the larger collieries we have in South Wales. I could give you the names of those collieries.

28452. You could give us the names of collieries where this happens?—Yes.

(*Chairman.*) You do not want to do so.

28453. (*Mr. Wm. Abraham.*) You are willing to give those names to the Chairman if he wants them?—I could not give them at this very moment.

28454. I know that?—Quite.

(*Chairman.*) We should like to make enquiries about that. You will let the Secretary know?

28455. (*Mr. Smillie.*) Your evidence goes further and says you have discussed this with colliery managers, and they have invariably taken up the position that this applies to "persons," not a "person"?—Yes; that is right, exactly.

28456. (*Mr. Ratcliffe Ellis.*) Will you give the name at the same time of the colliery manager you have discussed it with?—Very well.

28457. (*Chairman.*) You go on to Section 57, sub-section 2. The section now reads: "The owner, agent or manager shall supply a printed copy of the abstract and the Special Rules gratis to each person employed in or about the mine who applies for a copy at the office at which the persons immediately employed by the owner, agent or manager are paid." I do not know whether if the man asks for it or not that they are bound to give him a copy?—That is my point. I think a copy of the rules ought to be supplied whether he applies or not. My object is this: when a prosecution takes place the men are charged with not carrying out the rules. Those men may not know the exact wording of the rules. We have had at inquests questions raised concerning this, and the men say they have never had the rules. The question is asked, did he apply for it? and then the manager is free, of course.

28458. You go on to discuss the question of the eight-hours' shift. Do you wish to add anything to what Mr. Rowarth said on that subject?—Yes. I want to go further. I am representing the whole of the colliery enginemen and stokers at the collieries. He referred more particularly to winding enginemen. I say that wherever engines and boilers require attention during the 24 hours, three eight-hours' shifts of men should be employed thereat.

28459. You do that in the interests of safety, I understand?—Yes.

28460. That is the only point we have to consider in our Commission?—That is right.

28461. You can only argue the eight-hours' day before us with regard to safety?—Yes, and I believe that it would be in regard to safety. Take winding enginemen. It has been stated here this morning we have some working a 12-hours' shift, but I am very pleased to say that the majority of our men in South Wales are working the eight-hours' shift.

28462. Winding men?—Yes. In some parts of our coalfield, more particularly in central Monmouthshire, I am also pleased to state that the fan enginemen are also working eight hours, and other enginemen as well. I say what is practicable at one place is sure to be practicable at the others.

28463. What have you got to say with regard to the increase of safety owing to hours being shortened?—It stands to reason that when a man is on duty 12 hours he is not quite as alert then as he is when he is working eight hours, say at the tenth hour or so. What we contend is that the man is fatigued.

28464. As a matter of fact he cannot keep his attention on the alert without an undue strain upon it for 12 hours?—Quite so.

28465. Have you known any accidents happen owing to the strain being too much for competent people? I do not mean accidents from incompetence, but accidents from over-strain?—I could not mention a particular case at present, only that we believe that it would be for the safety of the working of the mines that the men should work eight hours.

28466. Do you find in South Wales that sometimes where the coal hewers work 10 or 12 hours the engine-winders only work eight? Do you find it is on a different footing from the others?—Yes. In South Wales they are working 54 hours per week. That is equal to nine hours per day. Then the engine-winders, where they are winding over 300 tons a day, are working eight hours.

28467. (*Mr. Wm. Abraham.*) Practically speaking at all our large collieries enginemen work three shifts of eight hours a day?—Quite so.

28468. (*Chairman.*) Although in many cases underground they work nine or 10 hours?—Yes.

28469. (*Mr. Wm. Abraham.*) A few are working more than eight, but the large majority are working eight hours?—That is right.

28470. (*Chairman.*) Have you gone into statistics to find out what proportion of accidents is in mines where the winding men are employed eight hours and where they are employed for longer?—I have not got the exact figures as to the accidents, but I venture to say that 75 per cent. are working eight hours.

28471. Take it that 75 per cent. do, and that 25 per cent. work longer. Do you find, on looking over the list of winding accidents, that there is a greater percentage in the mines where the winders work more than eight hours than in those mines where they work only eight hours? Have you tried to get out those statistics at all?—No. I cannot mention any particular cases, because in our district where they are raising less coal they are working longer hours.

(*Mr. Wm. Abraham.*) You should explain to his Lordship in the districts where they are working long hours they are winding much less coal.

(*Chairman.*) There is not so much strain.

28472. (*Mr. Wm. Abraham.*) That is the point?—Yes.

28473. (*Chairman.*) You naturally would not expect to find more accidents where they are working longer than eight hours, because where they are working longer than eight hours there is less for them to do, and not so much strain on them?—Yes.

Digitized by Google

28474. That might lead to another solution. Instead of having a universal eight-hours' day for winders, the Home Secretary might take into consideration the circumstances of each case.

28475-7. (*Mr. Wm. Abraham.*) We may have it out here at once. Is there any rule in force where enginemen have to wind 300 tons of coal and above that they are to have three shifts ?—Yes.

(*Mr. Wm. Abraham.*) I do not think we have much to complain upon this.

(*Witness.*) I have here the report on an arbitration in 1872. It is very old. Shall I read a portion of it ?

28478. (*Chairman.*) Yes ?—"The notices were held over, and a meeting of the trade took place at the Royal Hotel, Cardiff, on the 5th July, 1872, at which delegate engineers attended. The masters asserted that the 'agreement to refer' and award, included the engineers, and that inasmuch as the ironmasters had not altered the working hours of the engineers, the Associated Masters could not do so, but that they were willing to make the concession required of eight-hours' turn, or three men in 24 hours in the case of engines winding 300 tons of coal per day, because of the strain on the energies of the men and the greater risk to life and property."

28479. Might not that be a way out of the difficulty ? —I do not agree with it.

28480. You want it to be always an eight-hours' shift in all circumstances, whether the winding was 300 tons or not ?—Yes. A man might be winding 300 tons a day and working quite as hard as a man raising 600 tons a day, and even as hard as a man raising 800 tons a day. It depends upon the nature of his engine ; and if there are landings in the pit, it increases his work very materially. That makes the difference in taking out the number of tons raised.

28481. You say the number of tons raised is not a very good test ?—No.

28482. Of the work that is done by the enginemen ? —No.

28483. I mean of the continuity of the work done by the enginemen ?—No.

28484. You are not disposed to give any power of granting any exemption at all, under any circumstances, to working longer than an eight-hours' shift ?—No.

28485. You would make it universal and compulsory ? —Yes.

28486. At the same time in point of fact this 25 per cent. of men who are not working an eight-hours' shift, but a longer shift, are probably not harder worked as a rule than those who are working eight hours ?—But still I say that they are too many hours on duty. That is my point.

28487. The point is as regards safety. You cannot give the Commission any reason for supposing that in those mines where the eight-hours' shift does not obtain there are more accidents than where an eight-hours' shift is in force ?—I have not got those figures.

28488. You agree there may be cases where a man does not do any more work in nine hours, where there is not a greater strain in nine hours than there is in eight hours, but there might be circumstances which would make the strain as great on a man working eight hours as a man working nine hours ?—There is a possibility.

28489. With regard to the teaching of these winding enginemen, are you in favour of keeping the teaching in the hands of your Union entirely, or would you allow the managers to ask, as a matter of right, that certain persons should be taught the trade of engine-winding ? —What we believe is that promotion by seniority should be adopted where ability is combined. As has been suggested by the previous witness, a man should start either at the boilers or at small engines underground, and work himself up to the winding engines.

28490. I quite understand that. Would you prevent a person beginning at the beginning and going to the top, if anxious to become an engine-winder, and his character was good ? Would you insist on his belonging to the Union as a condition of his getting the certificate ?— We have not enforced that at all. We are endeavouring to get fair play for the men, that they should start from the beginning and go up to the top.

28491. I quite understand that, but that does not answer the question. Would you impose any restrictions whatever on a manager who wanted any number of persons to be taught the trade of engine-winding ? Supposing the manager agreed that your condition should be accepted, and that the man should begin at the beginning and go through the mill the same as you want him to do ?—We do not believe in having too many taught at the engine.

28492. You mean you would not be able to teach more than a certain number ?—That is right.

28493. The number ought to be limited simply by the opportunities of learning that could reasonably be afforded? —Yes.

28494. Subject to that you do not wish to limit the number in any way ?—For instance, we always agree that a spare hand man should be ready in case any of the enginemen are taken ill.

28495. I was asking about the teaching of these men. There are a certain number whom the managers want taught the trade of engine-winding and who want to be taught themselves, whether the managers wish it or not. You say they should go through certain training. Supposing they are willing to go through that training, then you say that there must be some limitation to numbers, as it is impossible that that kind of training can be given to any number of men at the same time. There must be some limitation according to the teaching capacity of the men employed in the winding work. Subject to that, you do not think there ought to be any limitation placed upon the number of men who would be taught engine-winding, nor do you consider it desirable that it should be absolutely necessary in order to obtain a certificate that they should be members of your Union. Do I understand you agree to those two propositions or not ? —We have not at all prevented any men the management have put forward becoming winders, only that they go through the proper course.

28496. You have always accepted and taught to the best of your ability anyone the managers have wanted you to teach ?—That is if he has come in proper rotation, that is, come from the bottom of the ladder up.

28497. You reserve to yourself the right to refuse a man on the ground of bad character or deficient intelligence or anything of that sort ?—Quite so.

28498. In point of fact you have never refused anybody on either of those grounds ?—I do not remember.

28499. There has been no friction at all between you and the managers as regards the number of men to be taught the trade of engine-winding ?—The only friction there has been is this : I want to raise this point because it has been raised some time back, I think. It is Q. 8310 in the evidence of Mr. Gray.

28500. (*Mr. Ratcliffe Ellis.*) It is a question Mr. Davis asked ?—Yes.

28501. With regard to some difference that there was ? —Yes.

28502. (*Chairman.*) That is the point : you wanted to compel the managers to choose the men in rotation. That is the difference ?—That is our point.

28503. You may have a lot of men in a list, and you are satisfied that they are all competent, and you say the manager should take the next man on the list and should not have the choice ?—What we advocated was that the men who were practised—the senior hands—should be appointed to the engine. What we object to here is this : it says that we insisted upon the senior man in order, but we say we insisted upon the senior man in order where capability was combined.

28504. The senior man who was considered by your union as being competent, who was on your list as a competent man ?—At any rate, he had been practised by the company for some months. That was the point raised. I want to emphasize this point. The very man that was objected to on that occasion, not only one, but there were two or three—but one in particular is winding now, and has been these years, and, so far as we find, giving every satisfaction.

28505. There has been friction between you and the managers because you want the managers to take men in rotation on a list of competent men ; on the other hand, the managers want to choose for themselves men out of this list and take anybody they wish : that is the difference between you, but there has been no friction I understand owing to your wanting, as the managers consider, to unduly restrict the number of men to be taught this trade of engine-winding ?—No, there has been no dispute in that way. I may say that the man the management were desirous of putting in we agreed to, and the management afterwards put in the men that the workmen asked for.

Digitized by Google

Mr. W. Hopkins.

6 Nov., 1907.

28506. Supposing there was a competent school possibly supported by the managers to teach men engine-winding, I suppose you should be satisfied that the training was sufficient training and anybody who passed that school could be a competent engine-winder, would you object to anybody obtaining a certificate from that school because he did not choose to belong to your trade union, or would you insist upon his belonging to your trade union ?—In reply to that, we should not object so far as that is concerned, but we may say that because a man has a certificate he is not necessarily a capable man to do the work as a winding engineman. A certificate is one thing, but the practice which is in vogue now is quite as necessary.

28507. I was supposing in this school they trained a man, whatever he wanted to be, a winding engineman or a stoker. If they taught the man his trade thoroughly, I wanted to find out whether you would insist upon a man being a member of your union before he should get a certificate of competency. Would you allow a certificate of competency to be given to a man outside your union, or would you make it a condition of getting it, although in every other way perfectly well qualified ?—We believe he ought to be.

28508. You would like to make that a condition if you could ?—Yes.

28509. (*Mr. Smillie.*) You would never think of laying it down as a condition that he must be a member of your trade union to get a certificate ?—I would not put it in that way.

28510. (*Mr. Ratcliffe Ellis.*) You would not teach him unless he was : that is the point ?—That is the rule more particularly.

28511. (*Mr. Smillie.*) He might be taught and secure a certificate ?—Exactly. You have taken me off the point if you will allow me to explain one thing. It says in Mr. Gray's evidence to which I referred that an accident happened.

28512. (*Mr. Ratcliffe Ellis.*) This is the question which was put (Q. 8315) : "Do you, in the case you refer to, know that the Enginemen's Union threatened to bring out the whole of the men and stop the colliery unless their particular man, the next man in order, was selected as the winding engineman." Mr. Gray, to whom that question was put, said, "I believe that was so." You can tell the Commission whether that was so or not ?—They have mixed up two cases.

28513. Will you answer my question whether in that case the Enginemen's Union threatened to bring out the whole of the men and stop the colliery unless their particular man, the next man in order, was selected as the winding engineman. Mr. Gray, the Inspector, said, "I believe that was so." You, as representing the Enginemen can tell the Commission whether that was so or not ?—The men threatened that they would discontinue working if the men in order of seniority, according to what is the practice, were not allowed to go to the engines.

28514-5. It is the Enginemen's Union I am talking about. Did the union threaten to bring out the whole of the men and stop the colliery unless their particular man, the next man in order, was selected as the winding engineman ?—In this particular case they did refer to it, but you are mixing two cases.

28516. "The Enginemen's Union threatened to bring out the whole of the men and stop the colliery unless their particular man, the next man in order, was selected as the winding engineman ?"—That is quite so in this case.

28517. (*Mr. Wm. Abraham.*) Are you perfectly correct now ? Was it not done by the men that were working in that place ?—Yes, in that place.

28518. (*Mr. Ratcliffe Ellis.*) My question was the Enginemen's Union.

(*Mr. Wm. Abraham.*) He said "Yes," but I know it is wrong ?—The branch you mean.

28519. (*Chairman.*) They had not the authority : that is the point. They might not have been able to carry out their threat ?—That is right.

28520. (*Mr. Ratcliffe Ellis.*) It either was the Enginemen's Union or the union in some other form which would say that all the men were to come out and stop the colliery unless the enginemen had the appointment of the engine-winder ?—That is so, the men at that colliery.

28521. What responsibility in law, or in any other way, is there upon the Engine-winders' Union or the Trades Union if a man appointed is not a competent man ?—But the men did not carry it out.

28522. Will you answer that question ? I want to go by steps. What responsibility is there upon this authority which claims the right to appoint the enginemen, if the man appointed is not a competent man ?—The union has no responsibility, but they are not going as far as that.

28523. Who is responsible if a competent man is not appointed ?—The manager.

28524. Do you think it right that the manager should remain responsible and that the union should appoint the engine-winder ?—No, we have not gone so far as that.

28525. Is that in the interest of safety in your view ?—No, the men have not gone so far as that.

28526. Will you answer my question ? In your view is it in the interest of safety that the manager should remain responsible, and that he should not have the right to appoint his man as engine-winder, but that the union who have no responsibility should be the persons to appoint the engine-winder. You put to the Commission in your view that is in the interests of safety ?—I say that the manager should be the person responsible, but that the men should have a right to put their case before the managers.

28527. That is not quite what you did in that case. In that case we have got as far as this. In this particular case we are dealing with the Engine-winders' Union, or whatever the authority might be, which insisted upon appointing the engine-winder, and they said "If we cannot appoint that man we will stop the pit." We agree in law the manager is responsible if an incompetent man winds. Do you say it is in the interests of safety that he should remain responsible and an entirely irresponsible body should make the appointment ?—No ; we say he should be responsible.

28528. You would not go so far as that ?—No.

28529. What is your suggestion for meeting that difficulty. This is a concrete instance of how you would apply your power ; you claim to appoint a man ; you have no responsibility, and you leave the responsibility to the man you will not let appoint the winder ?—The management had appointed this man.

28530. We will deal with the abstract question first, before we go into detail. What is your suggestion now ; do you say you should leave the manager responsible, but not allow him to appoint the engine-winder—that the man must be appointed by the Engine-winders' Union who have no responsibility ?—We say we have allowed the management to make the appointment.

28531. In this particular case. We know what the facts were there ?—We have allowed the management to appoint.

28532. You do not propose to give me any answer to my question with reference to this particular case ? Once more I put it to you : in this case you required that your man must be appointed, and not the manager's man. You agree that the manager is the responsible person, and that you have no responsibility. Do you suggest that it is in the interests of safety that the manager should be left responsible, but that the engine-winder should be appointed by an irresponsible authority ?—No, I do not think so.

28533. That is what you wanted to do here ?—No, we did not.

(*Mr. Wm. Abraham.*) That is not correct.

(*Chairman.*) A certain member of a Trades Union wanted to. The witness does not agree with the attitude taken up by the particular persons who acted thus.

28534. (*Mr. Ratcliffe Ellis.*) Do you disagree with the attitude taken up at that time, that is, a threat to bring out the whole of the men and stop the colliery unless their particular man, the next man in order, was selected as the winding-engineman—do you disagree with the action that was taken there ?—Not exactly in the way they put it.

28535. Do you disagree with the action that was taken as described in this question ?—I advised the men not to press their opinion.

28536. You disagreed with the action that was taken ?—That is it.

28537. Is it a fact that the man who was appointed, namely, the man the men said must be appointed, had an overwind in the course of a few days after he was there ?—That is the point I want to come to. I knew nothing about that case until I saw it here.

(*Mr. Wm. Abraham.*) That is not a fact.

Digitized by Google

28538. (*Mr. Ratcliffe Ellis.*) He says he did not know anything about it until he saw it here.—Yes.

28539. (*Chairman.*) You do not know; you have not made inquiries?—I have made inquiries since I saw it here.

28540. (*Mr. Ratcliffe Ellis.*) You say you never knew there had been an overwind until you saw it here?—Not at all.

28541. Since you have seen it here have you inquired about it?—I have made inquiries.

28542. You can hear nothing about it?—I went to see the men to see whether this was correct, and this man had not had the charge of the engine. He was an apprentice, and it appears an accident happened when he was there as an apprentice.

28543. (*Mr. William Abraham.*) He was not in charge of the engine when the accident occurred?—No; that is the information I received.

28544. (*Mr. Ratcliffe Ellis.*) Your information is that the winding man appointed by the Engine-winders' Union was not in charge when there was an overwinding?—This man was appointed by the management.

(*Chairman.*) What I understand him to say is that this man did make a mistake in winding while an apprentice.

28545. (*Mr. Ratcliffe Ellis.*) The question that is put is this. It is No. 8319: "And they had an overwind in the course of the first few days this man was there. Do you remember that?" I understand the witness to say although this new man was nominally in charge at the time of the overwinding, he was not in charge of the engine, but that an apprentice was?—Yes.

28546. The inspector was not informed of that, evidently?—Evidently, so far as I see here.

28547. (*Mr. Wm. Abraham.*) Will you put this right before you go further? Whatever happened did not happen in the hands of the man you wanted appointed?—No.

28548. (*Mr. Ratcliffe Ellis.*) Who told you it did not happen in the hands of the man you wanted appointed?—Because you are mixing up two disputes.

28549. That does not answer my question. Who gave you the information you have just given to the Commission that it was not this man who was appointed at the instance of your Union who caused the overwinding. You have made inquiries?—Yes.

28550. Who has told you that it was not this man?

28551. (*Chairman.*) What inquiries did you make?—I went to the pit and inquired from the men as to how that accident happened.

28552. (*Mr. Ratcliffe Ellis.*) What man gave you that information?—He is working in the colliery.

28553. This is a question affecting the engine-house?—Yes.

28554. How do you know at the time of the overwinding that the engine-winder proper was not in the engine-house?—He was in the engine-house at the time.

28555-6. Why do you say he was not responsible for the overwind?—I say that it was the apprentice, the man practising, who was at the engine at the time; the other man was in the engine-house.

(*Mr. Smillie.*) It was given in evidence that because he was incompetent an accident took place. He might be in the engine-house and have charge, but it was not because of his incompetency if the witness is correct.

(*The Witness.*) Is that matter perfectly clear now?

(*Mr. Smillie.*) You will have an opportunity of clearing that up with Mr. Abraham. I think it is necessary that it should be absolutely clear.

28557. (*Mr. Ratcliffe Ellis.*) You say that periodical inspection of all colliery engines and boilers should be made by an inspector appointed for such specific work by His Majesty's Government. Is this an inspector to be appointed solely for this purpose, or would you give instructions to the Inspectors of Mines that they should make an inspection of these engines and boilers?—I would suggest a special inspector for this class of work.

28558. Is it to be merely for mines or generally?—I am here to-day looking after the interest of mines.

28559. Your suggestion is that there should be a person appointed to inspect engines and boilers in mines?—That is so.

28560. Your difficulty, as I understand, with reference to boilers is that they are not cleaned out sufficiently often?—That is so.

28561. In some Special Rules there is a provision made, I think. In the Lancashire Rules there is this Special Rule; it is No. 91: "After the cleaning of any boiler he shall examine it externally and also the mountings. He shall also see that it is examined internally by the person appointed. No boiler shall again be set to work unless so examined and passed." If that rule was carried out, and there is a person appointed at the colliery to examine the interior of the boilers, would not that meet your objection?—If a person is appointed at the colliery?

28562. Yes, a person appointed at the colliery to examine the interior of the boilers, and that he did make that examination?—I may say that at present the responsibility is placed perhaps upon the foreman of the colliery, but I should say that there ought to be a person appointed by the Government to go round these boilers periodically.

28563. Why should not the Inspector of Mines, who is appointed see that this is done?—If he finds that he can do it, but I thought a special man for this particular purpose, perhaps, would have a better opportunity of doing this class of work more particularly.

28564. There are many sources of danger about a colliery. Why do you select boilers to be under some particular inspector? Would you also have an inspector detailed to look after other things at the colliery?—I am putting this under the engineering department, engines and boilers. I do not confine it to boilers alone.

28565. Engines and boilers?—Yes.

28566. Do you think there are so many accidents in connection with engines and boilers failing as to justify your suggestion that some special person should be appointed to inspect them?—I believe that another person appointed in that way would be more of a safeguard. We are fortunate; we have not had many accidents, I agree, but still we think inspection of the boilers, as I have already mentioned, should be made. In some places they clean them periodically every month; in other places they may run for three or four months. This particular inspector should then be empowered to say that they should be cleaned oftener, and so forth.

28567. A good deal, as you say, would depend upon the water?—Yes.

28568. Have you noticed the number of accidents arising from the explosion of the boilers? Have you any statistics to show how many there are?—I have not any statistics. I simply get it from the men that they clean them in some places.

28569. I want your own judgment about it. Do you think there are so many accidents arising from defective boilers as to require some inspection of them more than there is at the present time?—I do think through South Wales one man should be appointed for this class of work.

28570. Do you think there are so many accidents arising from explosions of boilers as to require, in the interests of safety, that some inspector should be appointed whose sole duty should be to examine boilers?—That is my opinion.

28571. How many accidents during the last five years have arisen from boiler explosions?—I am not going so much upon the point as to the number of accidents, but I am looking at it from the report I am having as to the different mode and time of cleaning boilers in the various districts.

28572. Is it not important to see whether some indication that those boilers are in such a dangerous condition is given by the number of accidents. Do you not think that you should have information about that before an inspector is appointed to look after them?—I do not know about that, but that is my opinion.

28573. Because the men tell you so?—Exactly.

28574. If there is an explosion in a boiler, there is a searching enquiry made by the Board of Trade?—Yes.

28575. Is that not sufficient?—No. They simply give a report of an accident, and we want to try and avoid them. That is my point.

28576. With reference to engines, are there many accidents arising from defective engines?—In reference to that point, the reason we want to make this inspection is that there would be no accident occurring at all. Now it is difficult sometimes for the workmen even to detect and point out to the management a certain defect. This particular inspector then could do that class of work.

Digitized by Google

Mr. W. Hopkins.

6 Nov., 1907.

28577. Are there many defects to be reported?—Perhaps it has not come to light. The information we receive is from the workmen, that their engine is in such a condition, and so forth, and we have to go by that, and that is the reason we give that evidence.

28578. Have you any details of complaints made by workmen about defective engines?—Simply what we have at meetings. I have not put them down in that way.

28579. You have no statistics to show in any way that there are such a number of defective engines as to justify your suggestion?—No.

28580. With reference to gauze protectors, there may be protection given without obscuring the glass. You want to see through this glass?—Yes, and thicker glasses in front of the others.

28581. They are generally adopted?—In a large number of places.

28582. With regard to this double exit to an engine-house, I suppose that is to provide a means of escape if there should be some bursting of a steam-pipe between him and the door?—That is right.

28583. That is so that he could get out of the door. How many cases have you known of that where a man was prevented getting out the ordinary door because a steam pipe burst?—So far as engine-houses are concerned I have only mentioned one, of course.

28584. Over what number of years?—That happened two or three years ago.

28585. You have known of one case. What were the conditions of that case? What did happen in that particular case?—The pipe burst.

28586. Was it a winding engine-house?—Yes.

28587. On the surface?—Yes.

28588. A pipe burst?—Yes.

28589. Could he not get out?—At any rate he was scalded, and one or two deaths occurred.

28590. Did the pipe burst between him and somewhere near the door? Was it in consequence of not being able to get out? A man may be scalded by a pipe bursting. Did the pipe bursting prevent him getting out of the door?—I am not positive of that case. I am more positive of the Tredegar case.

28591. What case is that?—Two men had gone down to the shaft where the pipes were leaking, and there was no place to run, and they had to come to the pit and fell down.

28592. It was not in an engine-house?—No, those pipes were leading to that engine-house.

28593. Let me remind you: your suggestion is "That each and every engine-house, either above or below ground where steam pipes are carried under the floor or through such houses, shall be provided with two ways of ingress or egress." Can you give me a case in which a man was prevented getting out of an engine-house, who thereby suffered an injury because a steampipe burst and prevented him getting out of the ordinary exit?—I cannot give you a specific case.

28594. Can you give me any case?—Without going into particulars about it, the only thing I know is that there were two men scalded at that place.

28595. That was not in an engine-house in the Tredegar case?—That was in the pits.

28596. In the case where the man was scalded in an engine-house, you do not know whether it was because he could not get out?—I am not positive.

28597. Do you not think it is a drastic alteration to suggest, because you have not known of a case, where a man could not get out of a door, that two doors should be provided?—No, I do not think so. What I mean is a door in the front and a door in the back.

28598. He can only go out of one door at the time, however many doors there are. You have not known a case where mischief happened because the man could not get out of the one door?—No, I cannot specify that.

28599. You think that certificates should be required not merely by engine-winders, but by the men who attend to any engine about the place? You said you would go further than the previous witness and let it apply to every sort of engine?—That is so.

28600. That is your view?—Yes.

28601. What sort of engines are there about collieries outside winding-engines?—There are fan engines.

28602. Donkey engines?—*Hauling* engines.

28603. Donkey engines?—If you want to put them in, yes.

28604. Is a man to have a certificate for that?—We say that the men would be very much more prepared in cases of emergency if they have certificates than if they have not.

28605. Do you think it would make any difference whether he had a certificate or not for an emergency?—Yes.

28606. Do you find any difficulty now with the enginemen, none of whom have certificates, in meeting emergencies?—I think they would be more equipped.

28607. With regard to the Special Rules that you suggest should be given—this is going rather outside your province as representing the enginemen?—No.

28608. You want them to be given to every workman, I understand?—Yes, because if it is necessary to our men such as enginemen, stokers, etc., I think it is necessary for all men at the colliery.

28609. Do you think it is too much to ask a man seeking employment to apply at the office if he wants to know the conditions under which he is to be employed?—I will put it in this way: when men are applying for work in the colliery generally, they may not know that such Rules are in existence so far as these Rules mentioned herein are concerned. Very well: it would not be natural for them to ask for them because they do not know they are in existence.

28610. Do you think that there are many men working at collieries who do not know that there are Special Rules?—Yes.

28611. A good many?—Yes.

28612. Do you propose that they should give them back when they leave the employment?—Yes.

28613. Do you see any objection to this, that they should be charged 6d., to be handed back when they return the rules, or charged something for the rules and handed back that money when they return the rules?—I suggest if they do not return the rules a certain charge should be made.

28614. Would you have any objection to the charge being returned by the coal-owner when the rules are returned?—The only difference between the two is, I say charged when they pay off, and you want to put it on before, a charge of 6d., but the man would not have interest on it.

28615. I say he should have his 6d. back when he returned the rules?—I say if he did not return the rules that amount should be kept for the rules.

28616. (*Mr. Wm. Abraham.*) As I understand, you, on behalf of your organisation, do not want the power to appoint enginemen at collieries?—Certainly not.

28617. You do not want to remove that responsibility from the management?—Certainly not.

28618. What you want is that from a number of competent men they should be selected in rotation?—That is right.

28619. The case in point was that your men wanted to protect one of their number because they thought he was victimised?—Yes.

28620. Not because they wanted the power to appoint the engineman?—Quite so.

28621. In justice to you I think I ought to put that right?—Thank you very much.

28622. Taking a broad view of what you have stated to-day, it is not so much the number of accidents that happen in your view, but that those that have happened could have been avoided if the amendments you now want had been in force before?—That is my opinion.

28623. It is more of a prevention than a cure after the thing has taken place?—Certainly.

28624. That is the position you are taking up?—That is the position we are taking up.

28625. I think there is one thing we are entitled to clear up with regard to the point you have been pressed upon. What is the real source of your information respecting the man who had been accused, if you like, or a charge had been made against him by the inspector, that he, being incompetent, was the cause of over-winding? You have investigated that case, and Mr. Ellis asked you whom

Digitized by Google

did you see. Can you clear that point up ?—From one of the men working on the Colliery: that is where I have had the information.

28626. Was that man in the engine-house ? What was his source of information ? He might have been informed from another man as well as you ?—I sent to ask for that information, and I had it. It was stated that this man was there as an apprentice, and that he had not had the charge of the engines at this time when this occurred.

28627. Was this apprentice under the charge of the man accused ?—I cannot say about the accusation.

28628. You know the case. It has been said after this man had been appointed that this accident occurred while the engine was in his hands ?—That is what I want to explain.

28629-30. Will you explain it ?—Where the dispute occurred was at Fochriw, about five years ago. I am coming back to this point. The management wished to put another man in, and that man was allowed to go in. The man we wanted to go in has been put in since then, and another one also, and they are doing their work, and I have not heard of any accident with them. Now to come to this point where they have been mixing those questions up. An engine-winder was required at the Bedlinog pit in the same Company. The management put that man in and this occurred, so that the men had not been near the management in connection therewith.

28631. It was not the man they wanted that was appointed ?—The management accepted this arrangement of putting the senior hand at the engines, and they put him at this other pit, not at the time this unpleasantness arose between the men and the management. This occurred about two years ago. That is what I want to explain; they are not the same circumstances. I may say so far as I know for the last 20 years it has been the custom at this colliery of appointing senior hands if they are capable of doing the work. Is that perfectly clear ?

28632. I do not know that it is much clearer now. We wanted definite information because, after all, here it is a question of safety. We want definite information that that accident did not occur in the hands of the man you defended ?—That accident did not occur under the man that we wanted appointed.

28633. What we would like to know is what is the source of your information on that point, which we consider to be a reliable source. Can you give us that ?—As regards this information, I made inquiries from the men at the colliery, and they know nothing about it.

28634. (*Mr. Ratcliffe Ellis.*) I think we cannot go much further than that if they know nothing about it ?—About an accident with the man they asked to go in.

28635. (*Mr. Wm. Abraham.*) Does that mean it did not happen; that there was no accident ?—No accident at the place where we were asking for the man to go in. That is the point I want to press. This happened where the management put the man in themselves.

28636-40. In another place ?—Yes, at another pit.

28641. (*Mr. Smillie.*) Rule 24 of the Special Rules is the rule which places the responsibility on the manager ? Of appointing a competent person to act as engine-winder ? —That is so.

28642. It says: "In any mine which is usually entered by means of machinery, a competent male person not less than 22 years of age shall be appointed for the purpose of working the machinery" ?—That is right.

28643. I take it that that is appointed by the manager ? —That is appointed by the manager.

28644. Of course the engine-winders as an Association would never think of taking that responsibility off the shoulders of the manager ?—No.

28645. Mr. Ellis put it to you that the person who has the responsibility, which is the manager, should have the right of appointment, and you agreed with him ?—I agreed with him.

28646. He put it to you what responsibility had the engine-winders, and I think you seemed to say that they had no responsibility ?—No, so far as appointing the men.

28647. Not so far as appointing is concerned ?—That is right.

28648. Has the engine-winder who is appointed not some responsibility if he makes a mistake ? Is he not charged before the Court ?—Quite so.

28649. To that extent he is responsible ?—He is responsible in that way.

28650. If he is a member of your organisation do you not undertake the responsibility of defending him if you believe he is right ?—We do.

28651. If you believe he is not to blame you take the responsibility of defending him ?—Yes; our rule states distinctly where a man has neglected his duty, or is incompetent, or anything of that sort, of course he loses all privileges.

28652. Your Association is not prepared to defend a man you believe has been negligent or incompetent ?—Quite so.

28653. Where does the responsibility of the manager really come in ? He appoints a person to be an engine-winder who may not be competent, and that person makes a mistake and an over-winding accident takes place. Where does the responsibility of the manager come in ? Is it not sufficient for the manager to say "I believed that this person was competent ?"—That is so.

28654. So far as a Court of law is concerned ?—So far as a Court of law is concerned.

28655. So that his responsibility merely lies in saying: "So far as I knew, this person was competent ?"—Quite so.

28656. Supposing that person held a certificate of competency, then the manager would say: "This person held a certificate of competency, which was a proof to me that he was a competent person ?—I would not personally say that it was all the duties of an employer towards appointing a winder. Although he has a certificate he ought to find out that that man is a practical man as well.

28657. I quite agree with you. It is the duty of a manager in his own interest, I suppose, to make sure that the person whom he has appointed is thoroughly qualified and has practical experience ?—Quite so.

28658. That is quite natural. I wanted to find out really where the responsibility of the manager lay. Supposing six men are killed through an over-winding accident, and it is proved in Court that the engine-winder has not had sufficient experience to justify him in claiming to be a competent person, the manager who appointed him goes to Court and says so far as he knew he was a competent person. Does not his responsibility rest there ? —It rests there.

28659. He cannot be in any way prosecuted if he has taken all reasonable means to prove that he is a competent person ?—That is so.

28660. Consequently his responsibility is not nearly so great as the responsibility of the person appointed ?—That is the point.

28661. I wanted to make that clear ?—And I may go further; I find that some of them very often take a man

28662. (*Mr. Cunynghame.*) Some of whom ?—That the managers very often prefer taking a man on who has a reference from another colliery, who has been winding before simply in preference to their own men who have practised, so that if an accident happened they would say: "I had a reference from this man, and as far as I knew he was a practical and capable man." That is easier for them sometimes than training their own men, men they knew from their boyhood. I think that is one of the reasons some take that course more than others.

28663-6. (*Mr. Smillie.*) With regard to your point as to the examination of engines and boilers, I am going to refer to the Bristol and Somerset, Monmouthshire and Forest of Dean Rules. Rule 58 says the enginemen or other competent person appointed for the purpose shall see that the boilers ordinarily in work are regularly and properly attended to and cleaned not less than once in every three months ?—I have not got that.

28667. Is that the rule in your district at the present time ?—No, we have not that in our rules.

28668. Would it be satisfactory if you had that ?—Yes, I think that would meet the case.

28669. Let me call your attention to that: "The engineman or other competent person appointed." If that were in the hands of the engineman to make sure that a periodical and regular examination at least once in every three months was made, that would be satisfactory, if the engine-winder had the power to do so ?—What I feel is that too much is placed on the shoulder of the engineman under whom he is employed. I believe that an independent person

Digitized by Google

Mr. W. Hopkins.

6 Nov., 1907.

periodically inspecting the whole of the machinery department should be the person to say so. The difficulty would be for the engineman to dictate to the manager how often they had to clean their boilers.

28670. This rule says that once at least in three months it must be done. That is Rule 58. It says an engineman or other competent person shall have power to see that certain things are done. I want to ask you something with regard to that. Would you rather have a person appointed on behalf of the Government to make a periodical examination?—Yes.

28671. Is that a cursory outside examination of the boilers, or is it a thorough examination of a boiler when it is blown off and cleaned?—What I suggest is that there should be an examination by this person apart from what is done by the person appointed on the particular colliery.

28672. The examination of a boiler might be made from the outside, as it were, and there might be failures which could not be discovered unless the boiler was blown off, emptied, and cleaned?—Yes.

28673. Do you merely mean a periodic monthly or quarterly examination of the outside appearance?—No, the inside appearance.

28674. It would mean that the boilers would require to be blown off and cleaned out?—Yes.

28675. You think that should be done by a person appointed by Government, once a month?—That is so.

28676. That is your opinion?—I should like to correct that, so far as once a month is concerned: that might be more often than necessary. If the man went round once in three months it would be sufficient for him to decide how often those boilers had to go out.

28677. That is in the interests of safety?—That is all.

28678. I suppose your own opinion is that boilers might be allowed to go on until they became absolutely dangerous?—Yes.

28679. An engine-winder might not know of the existing danger because of want of a thorough examination?—In our district there are many instances where engine-winders do not see into the boilers at all. It does not come within their province. It depends entirely on the boiler feeder, or the stoker.

28680. So that they might not be aware of any dangers there?—Yes.

28681. You admit an eight hours' working day is desirable for all persons employed in any class of engines or boilers in or about a colliery?—I do.

28682. This Commission is chiefly concerned with accidents, and the safety of underground workers and those employed in and about a mine?—I quite understand that.

28683. Mr. Abraham and I meantime are chiefly concerned with persons who raise and lower workmen. It does not apply generally in Wales, but do you think that long hours for engine-winders in collieries tends to want of safety?—I do believe that.

28684. You, yourself, have had considerable experience as a winding-engineman?—I have.

28685. From your own experience, and from what you have learned from your fellows, it is an increasing source of danger for men to be employed as engine-winders for long hours?—Quite so.

28686. Extended hours?—Yes.

28687. You believe it would tend to safety underground if the hours generally of engine-winders were limited to eight per day?—Yes, apart from any quantity at all.

28688. Apart from any quantity of material wound?—Apart from any quantity at all of coal raised.

28689. You have in South Wales perhaps 60 or 75 per cent. of the engine-winders whose hours are limited to eight per day, because of the fact that they wind 300 tons per day?—That is so.

28690. An engine-winder may only wind 150 tons per day, but he may have other duties in addition to the winding which may be his ordinary duties, as if he was winding the 300 tons?—There are some instances in that way.

28691. (*Mr. Cunynghame.*) There are some mines in which a man only winds 150 tons?—Yes.

28692. (*Mr. Smillie.*) My point is that in Wales, by mutual agreement, they have agreed that eight hours are the hours for engine-winders where the output in a shift is over 300 tons?—May I be allowed to say one thing further: there are instances where the employers do not carry that out.

28693. Then they are not carrying out the agreement?—So far as I read it out to you this morning.

28694. Is that 300 tons of coal?—We claim 300 tons gross: 300 tons of coal raised from the pit. The employers are endeavouring to explain that it should be 300 tons of large coal.

28695. Supposing an engine-winder raises 250 tons of coal and may require to wind 100 tons of foreign matter altogether, stones and so on, would that count as 300 tons?—Not at all.

28696. An engine-winder might require to wind 500 tons of water in his shift, and he would not come under this rule, 300 tons of coal?—Quite so.

28697. It would be almost as difficult work to wind water or stones as it is to wind coal?—Yes.

28698. There is not any difference so far as the engine-winder is concerned?—Not at all.

28699. Your rule confines it to 300 tons of coal, and an effort has been made to confine it to 300 tons of round coal?—That is right.

28700. That is entirely a matter between the employers and yourselves of course, in the meantime?—Yes.

28701. I want to come back to my point, an engine-winder can wind 150 or 200 tons of coal from the pit, and might be performing other duties when he was not winding. He might be attending to a haulage engine, or some other engine, in his spare time?—We have some doing that, but they are very few.

28702. In some districts you mentioned it was pretty common?—In some districts in Monmouthshire. I cannot say it is very common.

28703. You only speak for South Wales?—Yes, and Monmouthshire.

28704. In a case of that kind, you hold it is as necessary for an engine-winder to have eight hours whether he is winding 300 tons of coal or more?—That is so.

28705. Running the risk of repeating myself, I want to be clear what your position is with regard to certificates for engine-winders. You feel, and your people feel, that no manager should have the right to come in at any time and dictate to an engine-winder as to whom he should teach that particular trade?—We as enginemen claim, if we object to the man, that we should have that right.

28706. That you should have the right to object?—Yes.

28707. The manager of the colliery would have the right, as manager, to use the engines for the purposes of teaching a person when the engine-winder was not there at all?—Quite so.

28708. He always possesses that right?—Yes.

28709. The engines are under his charge when the engine-winder is not there?—Yes.

28710. He would be entitled to teach a person?—Exactly.

28711. I suppose the majority of colliery managers are capable of working a winding-engine, not for a regular thing, but capable of winding, I suppose?—I do not know, but I should say a large number of managers are capable of winding.

28712. Do you know some colliery managers who could wind a cage up and down?—Yes.

28713. Who are engineers in addition to being colliery managers?—Yes.

28714. Neither the engine-winders nor the Engine-winders' Association would think of dictating and saying "You are not entitled to come to the engine-house when we are not here and teach a person?"—They have never objected in that way that I know of.

28715. Mr. Abraham and I want especially to be clear of this: your chief desire is to produce a class of engine-winders who will secure the greatest possible safety to the persons working underground?—That is so.

28716. Your Association as a Trades Union takes considerable pains to make sure that only steady competent persons will be taught by your Association?—That is right, and I think that we are emphasizing the point that has just been dealt with, that we are striving for safety, otherwise we would not advocate certificates of competency

Digitized by Google

for the men. Take that case that has been raised between the men and the management. Supposing that certificates were in force then, that man could not have gone into the engine-house. Can you see the point?

28717. Yes, he could not have had a certificate?—That is right, if he had not passed his certificate of course.

28718. (*Mr. Ratcliffe Ellis.*) He would have got a certificate if the law came into operation as to service?—This man was a pumping engineman before he went to winding. Under the proposed certificates this man would have to hold a first-class certificate.

28719. (*Mr. Smillie.*) Would it have been possible for the person whom you allege was guilty of this over-winding accident to have secured a certificate of competency if he stood an examination?—I do not allege that he was guilty of over-winding.

28720. You say an overwinding accident took place at a different pit where the manager put in a different man?—It is another place.

28721. Is that the case in which this person had only attended to a pumping engine before?—Yes.

28722. Had he been taught a winding-engine?—No. He was apprenticed for it.

28723. He would have taken a certificate by examination?—I do not believe so.

28724. Is there anything at the present time to prevent colliery managers in the event of a strike taking place, or a lockout of the engine-winders in South Wales, starting generally incompetent persons as engine-winders? There is nothing to prevent them: they can put anyone in.

28725. Except the provisions of the Mines Act which says "competent persons"?—That is right.

28726. A manager may satisfy himself that a person is competent by asking whether or not he has been an engine-winder previously?—That is so.

28727. The only responsibility is that he requires to say: "I did my best to find out whether he was a competent person"?—That is so.

28728. He does not require to ask for a certificate as to whether or not he was really a competent engine-winder?—He has not at the present time. I should like to add something as to the necessity for eight-hours' shift for winding-enginemen because of the responsibility of their duties. I say that there are other enginemen whose duties are very responsible, and that 12 hours is too long for them to be on duty. I refer to the fan enginemen. In our district we have collieries where there are about 1,000, 1,200 more or less, of men working underground, and they depend upon the ventilation of that colliery and upon the engine working properly, and according to the rules they state "as far as enginemen are concerned." I maintain that 12 hours is too long, and especially the 24 from Sunday morning until Monday morning in that engine-room———

28729. (*Mr. Ratcliffe Ellis.*) That is when the change takes place?—Yes, the change of shifts. Shall I just put it in this way. The course of working at present is this: a man starts on Monday morning from 7 to 5, and follows up that routine until Saturday: he works 7 to 2. Then on the Sunday, from 7 Sunday morning until 7 Monday morning, that is 24 hours on a shift. The men on the night shift then work from 5 until 7 the next morning, 14 hours on the Monday night, Tuesday night, and the following Saturday night he starts at 2 and works until 7 Sunday morning, when the man comes to change him. I say that those hours are much too long for any man to be in charge of those engines. I may emphasize my point by saying recently, owing to a man giving way to nature, falling asleep, the magistrates at Aberavon felt so strongly about the safety of the men, that they thought it advisable that the man should get a month's imprisonment. They saw the onus was so great, and the management, when they gave evidence before the Police Court, said the lives of those men in the colliery are dependent upon the safe working of the machinery on the surface. If that is so, I beg to point out surely 12 hours is too long for those men to be on duty. That is my point so far as the other classes of enginemen are concerned. The same would apply to boilers. The fact in some portion of the coal-field eight hours very nearly is general, shows that what we are putting forward is only a fair and reasonable point. Those employers feel that it is necessary that these men should work eight hours: hence they are employing the three men during the 24 hours' shift and during the week. I hope that the Commission will see that this matter is deserving of attention. That is my point with regard to those other enginemen.

Will you allow me to say, further, that so far as these men are concerned, even as to their own safety, it must be noticed that they are working 84 hours per week, and allowing them time to reach home to change, to have food, and to go back, these men have only, out of the 168 hours in a week, 63 hours as it were for rest, even if they go from work to bed and from bed to work.

28730. That is when they are on the night shift?—I am taking it now that they are working 12 hours, not 10 hours, by day, and 14 by night—that you divide that evenly: those hours, as you see, will take all their time.

28731. (*Mr. Ratcliffe Ellis.*) You have been an engineman yourself, I understand?—Yes.

28732. I suppose, speaking as an engineman, when you worked these hours you did not feel quite equal to your job at the end of your time?—That is what we feel.

28733. That is what your view was, speaking for yourself?—Yes.

28734. It has been said that these new engines, larger engines, put a greater strain upon the men: but there are mechanical contrivances which enable a man to control the engine much better than he used to be able to, are there not?—But the speed at which they are working at present brings the strain very much upon them. Collieries now very often are raising 1,500 tons or 1,600 tons of coal per day.

28735. There are, of course, more mechanical contrivances attaching to the engines than there used to be, which enable the engine-winder to have more control of an engine. But you think notwithstanding that, that the strain of these long shifts is too great upon a man?—That is my opinion.

Mr. THOMAS JONES called and examined.

28736. (*Mr. Cunynghame.*) You act on behalf of the South Wales Winding-Enginemen's Association?—Yes.

28737. What are you?—General Secretary.

28738. Have you been a winder in your time?—Yes.

28739. For how many years did you wind an engine?—20 years.

28740. You are, I think, in favour of some improvement in the sanitary condition of engine-houses?—Yes.

28741. What do you want done?—To have them thoroughly cleaned out, the walls whitewashed or painted, and do away with all filth that would be left to be accumulated inside the engine-house.

28742. What objects would be attained by that?—We are of opinion that it will be healthier for us as enginemen.

28743. You say that there should be a lavatory in engine-houses?—Yes.

28744. Do you mean a W.C.?—A W.C.

28745. You do not mean hand-washing things?—No.

28746. You want also exits and egresses in winding-engine houses?—Yes.

28747. Will you explain that, please?—Supposing, for instance, this room is an engine-room, there should be a door to come inside *there*, and *this* one is to go out by: that is what I should term an ingress and egress.

28748. You are in favour of eight hours for all winding-enginemen?—Yes.

28749. You heard the evidence which the last witness, Mr. Hopkins, gave?—Yes.

Digitized by Google

Mr. T. Jones.

6 Nov., 1907.

28750. Have you anything to add to what he said? Do you wish to disagree with it, or to supplement it in any way?—I have nothing more to say than what he has just told you.

28751. That represents fully your view, does it?—Yes, practically.

28752. Then I think I need not ask you to repeat the evidence further than to say that you agree with it?—Quite so.

28753. You want, I think, adequate brakes on winding engines?—Yes.

28754. Is it the case that there are not adequate brakes at present?—From our point of view, what we define as being an adequate brake, is that in a single cage in a shaft, that is assuming that you were changing the rope, you would only have the weight of one cage then: that is what we say is a proper definition of an adequate brake—that it will hold that cage down in the shaft.

28755. There is a rule in the Act of Parliament for all Great Britain which says "There shall be attached to every machine worked by steam, water, or mechanical power, and used for lowering or raising persons, an adequate brake or brakes": and then it says "If the drum is not on the crank shaft, there shall be an adequate brake on the drum shaft." If that rule was carried out, would that satisfy you, or would not that be enough?—Yes—if that is a proper definition from our point of view of an adequate brake.

28756. It says that there shall be an adequate brake?—Yes; of course if that is a proper definition of it, and if it complies with our requirements, we are quite agreeable to it?

28757. You think, in fact, that some of the brakes used are not what ought to be called adequate brakes?—Quite so.
